Whole No. 2163.—VOLUME LXXXIV. Number 1. SAN FRANCISCO, SATURDAY, JANUARY 4, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

A Use for Silver.

A bill has been introduced into Congress to put an ad valorem tax on imported manufactured silver of 25%. The idea is not protection for the silver manufacturer, but for the silver producer a practical suggestion, looking toward the increasing of the market for the metal in this country. This is what is wanted, not restricted production, hut more use. It is suggested that silver miners become silver manufacturers as well. Attention is called to the fact that the household use of silver could be much extended and popularized if the manufactured articles of tahleware were cheapened in price. Under present conditions the cost of manufacture is higher than need be, and the jewelers who control the sale have high profits. If the silver miners established and operated their own silverware factory, and had a fair manufacturer's profit, silver articles could he sold a third cheaper than at present, and their use enormously extended. It is not likely that the price of silver could be much advanced, hut it could certainly he given an additional demand which would tend to keep it from going lower. Silver miners have ample successful precedent for their suggested entry into the silver manufacturing business. The makers of iron and steel have become their own miners of the iron ores. Miners of zinc, lead and copper have already hegun the manufacture of their metal production into its final consumahle form. At the Lake Superior mines copper wire, copper tuhes and sheet copper are manufactured direct from the finishing melt of the reduction process from the ore. It is reported that at the United Verde mine, at Jerome, Ariz., a copper manufacturing plant has been installed, and that the last melt of the metal in the refinery is used for the manufacture. There is no reason why in the same plant the silver should not from its final refinery melt go directly into spoons, for illustration, instead of into silver bricks. Certainly, with cheapened silver spoons there would be more market for them, and the sale value of silver bricks would, if anything, increase, simply because with more silver spoons manufactured there would he fewer silver hricks manufactured.

Gasoline Locomotive.

Herewith is illustrated the Prouty gasoline locomotive. Gasoline engines are common motors, hut a gasoline locomotive is somewhat of a novelty. They are huilt for mines and tramways in a number of styles and sizes and to haul from 15 to 100 tons, some sizes made to take as narrow as an 18-inch gauge. The amount of load that a locomotive will haul is determined hy its weight, and the condition of the track, grades, curves, etc. The manufacturers furnish a data blank to he filled in and from which they will make an estimate and guarantee the work the locomotive will do successfully under the conditions stated. The particular features in these locomotives are the method of carrying and feeding the gasoline so that it is entirely consumed in the engine cylinder, which prevents the escape of any smoke or odors and lessens the liahility to accidents. The driving and reversing clutches hetween the engine and car axle are so constructed that the engine is run one way without stopping; the car may he started smoothly either way and driven at any desired speed up to the maximum, by one single lever, as seen in the hand of the driver in the illustrations on this page.

The Prouty Gasoline Locomotive.

Prouty Gasoline Locomotive and Train of Ore Cars.

FAITH in the invincibility of what is, against displacement hy the novel, seems less fixed than has been customary. Marconi announces that he has received wireless telegraphic signals across 1800 miles of the Atlantic ocean separating New Foundland from England, and the holders of Atlantic cahle stocks are influenced to sell out on a declining market. An explanation is made that this last announcement hy Marconi would indicate that the curvature of the earth is no bar to his system. This, however, was long since conclusively demonstrated hy communication hetween ships over 30 miles apart. With commercial success already accomplished up to 300 miles distance, experiment is only concerned with overcoming greater distances at sea and the physical ohstacles on land.

THE day of 17-cent copper has passed; that price never had a firm foundation, and when imports hegan it necessarily fell. There will he an equalizing, a lessening of production and a price probahly as low as 10 cents. Michigan, Montana and Arizona copper miners have seen this coming, and most of the larger producers have put themselves in readiness for the inevitable by the accumulation of surplus funds, the construction of new works and the installation of extensive and expensive plants. Copper is now produced at a cost of 6 cents per pound; and even when it sells at 10 cents, the hig producers will he in condition to produce at a profit. In no department of metallurgy has scientific mining made more advance; and, despite gloomy assertions, the copper-producing interest will continue to he one of continuous development and permanent profit.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Prouty Gasoline Locomotive; Prouty Gasoline Locomotive and Train of Ore Cars, 1. Construction of Mine Telephone Lines, 7. Hundred Pound Post Hammer, 8. Mining and Metallurgical Patents, 9

EDITORIAL.—A Use for Silver; Gasoline Locomotive; Wireless Telegraphic Signals; Prices of Copper, 1. Steel Direct from Ore; Great Metallurgical Installations in 1901; Smelter for the Cœur d'Alene Mines; The Value of Mine Accounts; Long Distance Electrical Transmission, 2.

MINING SUMMARY.—11-12-13-14.

LATEST MARKET REPORTS.—14.

MISCELLANEOUS.—Concentrates, 3. Quicksilver, 4. Delegate Smith's Bill; Exports of Silver to the Far East; The Chemical Analysis of Portland Cement, 5. The Cost of Mine Patents, 6. Construction of Mine Telephone Lines; Rock Containing Platinum Metals; Bill Levying Duty on Importations of Manufactured Silver, 7. To Establish the Department of Mines and Mining; Hundred Pound Post Hammer; Electrical Expressions and Their Equivalents; The Electro-Metallurgy of Zinc; Efficiencies of Electrical Apparatus; No Time Limit to the Modus Vivendi, 8. Mining and Metallurgical Patents, 9. Latest Rulings Under the Mining Laws; Conflict in Rule Between the U. S. Supreme Court and Land Department, 10. Personal; New Patents; Notices of Recent Patents; Commercial Paragraphs: Recently Declared Mining Dividends; Books Received, 14.

SOME months ago the projecting of a steel making plant in Italy, to use electric power generated from water to reduce the iron ore, was noted. The incident was notable inasmuch as the experts had very elaborately and convincingly demonstrated by their figures that it could not be done on a commercial scale in competition with the advanced methods in use at Pittsburg, Pa. A few days ago the telegraph noted the incorporation of a company to make steel direct from ore in a plant projected at Elizabethtown, Tenn. It is rather startling to find the experts challenged on their own ground. It is hardly to be presumed that the incorporation is not a legitimate business organization to do just what it says it will do, namely, make steel directly from iron ore by the electric current as a commercial proposition. One ounce of commercial demonstration will overturn mountains of theory. In this case the commercial possibilities that the ounce of commercial demonstration will open up are dazzling. Cheap as iron and steel now are, they will become still cheaper, since their production from the ore can be made so near to the point of consumption of the metal that the cost of transportation can be largely eliminated.

THE year 1901 was notable for the number of great metallurgical installations made in the United States. The year 1902, just beginning, will hardly see a duplication of these great plants, but will be very likely to witness the installation of a great number of metallurgical plants of moderate size. High efficiency and economy of cost can be obtained in plants of moderate capacity as certainly as in the very large ones. The latter will not have a monopoly of metal production simply because they are very big. Mine owners this year, with lowered prices for silver, lead and copper, in order to maintain the production and profit earning power of their mines, must reduce the cost charges against their ore production. Modern, up-to-date metallurgical plants of moderate capacity, operated as part of the mine plant, offer the best chance to make the cost reductions. With gold mining of free milling ores the practice of making the mill part of the mining plant is established as a custom. The idea of doing the mining only and giving the profit of the milling to another hardly receives consideration now. There seems much reason to anticipate that the current year will see the development of the same practice into a fashion with mines where the ores require smelting and subsequent refining. Both smelting and refining are commercially possible with small plants. While it may be that some direct costs will be increased, the indirect ones that will be eliminated or reduced will be found to offset the increases. That the installation and operation of metallurgical plants as part of the mining business involves some addition of risk is inevitable. A better knowledge of the business reduces, however, the risks that a few years ago were often prohibitive, and there is compensation for risks in the profit that success insures.

Smelter for the Cœur d'Alene Mines.

It is reported that the silver-lead miners of the Cœur d'Alenes, Idaho, are planning to jointly build a great smelting plant to reduce the ores from their own mines, in order to get the smelting profits now realized by the smelting monopoly. As a fact, the contemplated action is based on broader grounds than the simple predatory impulse stated above. Lead smelting is naturally a subordinate detail of the business of lead mining. The existing relations practically reverse this and make an unnatural relation. The lead miners—more exactly, the lead-silver miners—do not control their own investments. The smelter monopoly makes sale prices and imposes contract terms regulating the mining, buys lead ore or declines to buy—all from the standpoint of interest, regardless of the miner or his investment. The market value of the latter is as absolutely controlled by the smelters as is their own investment. It is impossible that such a condition could endure permanently. Either the smelters would take over the actual ownership of the mines on their own terms as to price, or the mine owners would build their own smelters. It is to be hoped that the Cœur d'Alene miners carry out their stated intention and build their own smelter. Other lead-silver mining miners would undoubtedly follow the example. Indeed, they would have to, to continue to exist. It is practicable to effect a community of interest organization for the smelting works which will leave the individual operation of the mines absolutely free and untrammeled, except by the common commercial restrictions imposed by the market price of the metals. While the Cœur d'Alene miners are building their smelter plant they should not miss the opportunity of being up-to-date, or, indeed, of making a new date. They can add the manufacturing machinery at a comparatively insignificant additional investment, and turn the lead from the ore directly into lead pipe and the silver into silver spoons.

The Value of Mine Accounts.

The superintendent's report, and the bookkeeper's balance sheet and profit and loss account of a large mining enterprise are instructive and suggestive reading for the managers of small mines. The latter are apt to regard the operations under their charge as too small in detail to warrant the cost of systematizing and detailing the outlay and income. Bookkeeping is rather looked on as a sort of necessary evil to be endured and not to be made more complex than simple entry or the simplest kind of entry would require. If the mine pays the bookkeeping that tells how it does it is considered rather trivial, and if it does not pay economy is likely to begin with the bookkeeping department.

To dispel this indifference a careful reading of the superintendent's reports and the bookkeeper's statements of the great mines that have been made great by little profits from low-grade ores can be suggested. An imitation of the methods of these great mines can hardly fail to bring a greater measure of commercial success to the small mines. In looking over the accounts it will be noted that no item of expense is regarded as trifling. Each in proportion to its dollars is charged against the ore, the raw material the mine produces. On the other hand, no source of income is regarded as too small to be included as adding to the output in value of the raw material, ore. There are no avoidable wastes permitted to show through successive years in these profit and loss accounts. The superintendent with the profit and loss account and its details is enabled to intelligently examine each for possible gains by economy or change.

Condensed statements are of more limited value than fully detailed ones. The parts that make the whole cannot be guessed at successfully, and while such condensed statements may on the face, and by comparison with the condensed statements of similar operations, seem satisfactory and intelligible, the details fully stated may tell an entirely different story as to the particular operation they record.

Long Distance Electrical Transmission.

Successful long distance electric power transmissions, so numerous in the Western States, particularly California, seem still to be a surprise to Eastern electrical engineers and investors, while accepted as a matter of course by their builders and people here. This difference in the view point is not wholly explicable. In these days nothing that is new remains a novelty very long. It is not so many years since the discovery of the Roentgen rays was announced. Now, nickel-in-the-slot machines on the street corners offer Roentgen rays to the passer-by who wishes to see what his bones look like.

So it has been with long distance electric power transmission on the Pacific coast. Engineers on the Pacific coast, more than ten years ago, began to regard the lately accomplished long distance electrical transmission of the water power of the Sierra Nevada mountain streams as simply a matter of commercial detail. It would be accomplished whenever it could surely be anticipated to pay. In the then state of the art of long distance electrical transmission of power it would not have paid commercially. The art, meanwhile, has advanced. It does pay commercially now because advanced knowledge has made it possible to reduce installation costs. The long period during which anticipation discounted accomplishment robbed the latter of novelty to some extent. Perhaps the instinctive professional feeling of engineers that this enormous natural energy of falling water going to waste was unnecessary was the inspiration to the effort to reclaim it. The Eastern electrical engineer and capitalist see only the end, the spectacle and the solid fact of success that accomplishment has provided.

What is done can be done again. The long distance transmission which is, here in the West, can be, in the East. Commercially, the problem is not quite so simple. Population and industry are distributed more evenly and over wider areas in East, and the sources of power are closer to the market for it. Transportation is not as large an economic waste, measured by its ratio to the other elements which constitute the cost of production. Yet, even with these differences, the economic tendency to increase the profits of production by reducing ever so little the cost will result in long distance electric power transmission there as here.

The sources of prime moving energy are not likely to be the same. The unit cost of power development from low heads of water is much more than from high heads. The former cannot compete in cheapness with cheap coal at the pit mouth. Improvements in transforming the latent energy of coal into work are being constantly made, and there is still a large margin to reward successful further improvement. Statements have been made that the Mond process for making fuel gas from coal at a cost of 4 cents a thousand feet has been improved on in the United States by the invention of a process which produces a better fuel gas at a cost of 2 cents a thousand feet. The transportation cost for coal from the pit mouth to the consuming furnace has been decreased some, but to nothing like the extent either absolutely or in ratio. It would seem as if, commercially, the copper wire was cheaper than the railroad for the transportation of energy up to 230 miles, if not to even greater distances.

The measure of commercial success that is attending long distance power transmission on the Pacific coast can be appreciated from authorized figures lately published by the Bay Counties Power Co. in California, the distance of transmission from the water power to points of use ranging from 80 to 220 miles. The gross earnings for April, 1901, were $13,913.21, expenses $4466.35, net earnings $9446.86. These have steadily increased each successive month. In September, 1901, they were: gross earnings $25,463.52, expenses $6804.59, net earnings $18,598.93. Contracts are signed, and await only the connecting and motor installations, providing $15,000 additional gross earnings monthly, and the remaining already developed power will bring $10,000 additional monthly. The total gross earnings will then be $50,000 monthly, with not more than $9000 monthly expense, leaving about $41,000 monthly net earnings.

Concentrates.

THE three metals, sodium, potassium and lithium, are lighter than water.

THE loss of quicksilver in a gold mill varies from one-fourth ounce to one-half ounce per ton of ore treated.

THE average depth of machine-drilled holes in tunnel headings is about 5 feet, depending on the size of the tunnel and the hardness of the rock.

A BAR OF IRON increases in length when first magnetized, but upon increase of the magnetizing force the effect is reversed and the bar shortens.

THE rise in the price of the Brazilian carbonado, or black diamond, has in most cases increased the cost of diamond drilling from $1.50 to $4 a foot.

TO FIND the weight of a grindstone, square the diameter in inches, multiply by the thickness in inches, and multiply this product by the decimal .06363.

THE pressure developed by fulminate of mercury is estimated at 193 tons to the square inch, nitro-glycerine 86 tons, gun cotton 71 tons, blasting powder 43 tons.

"CHEAP" labor is not profitable labor. Usually the "cheaper" the more worthless. The man or mine dependent solely on cheap labor will find it the dearest in the long run.

TO amalgamate rusty or greasy gold use a solution of equal parts of cyanide of potassium, sal-ammoniac, sodium and oxide of manganese. Add sufficient water to make a weak solution.

A GOOD PROTECTION for hoist cables against corrosive mine waters is a mixture of pine tar and tallow applied hot. The proportions are five to eight gallons of tallow to a barrel of tar.

A "NATIVE AMALGAM OF SILVER WITH MERCURY" is not wholly unknown. It is found in some widely divergent localities, notably in largest quantity in the silver mines of Coquimbo, Chile, S. A.

THE lessees in a mining lease may remove railroad tracks placed by them, where such removal causes no material injury to the freehold and where the lease is silent as to the right of removal.

EXPERIMENTS are considered to have fully demonstrated that steel making furnaces can be kept as hot and the steel made as quickly by the use of oil as when gas is used. From nine to ten hours is required for heat.

IN a pipe 12,600 feet long, 6 inches diameter, head 200 feet, the water will attain a velocity of 4.26 feet per second. This multiplied by the area in square feet of a section of the pipe gives the discharge per second in cubic feet.

THE term "bushel" is not recognized west of the Rocky mountains, and there is no standard weight of charcoal per bushel in California, but a "bushel" of charcoal made from oak wood will weigh forty pounds; from pine thirty pounds.

THE refining of copper by the electrolytic method is certain to show platinum if it exists. It would be thrown down with the gold and silver and in the subsequent treatment, not becoming dissolved by the acids used or slagging off, it would be left with the gold and disclosed by assay.

THE electrical reduction of aluminum by the Heroult electrical process consumes about 20 kilowatt hours of electric power to the pound of aluminum produced. This includes all the power used about the reduction works and not merely that of the current directly effecting the reduction.

COPPER OR LEAD in small amounts can be removed from mercury by putting it under warmed diluted nitric acid, stirred at intervals of one-half hour for four hours. Lead in larger quantities is removed from mercury by retorting, the mercury being covered to the depth of about 1½ inches with powdered charcoal.

THE Supreme Court of Montana, in the case of McShane vs. Kenkle, ruled that the finding of mineral in the rock in a claim constitutes the act of discovery as contemplated by the U. S. mining statutes, nor is it necessary that the mineral should be found in payable quantities at the place and time of discovery.

THE reported rates of tunnel heading advance daily in the Simplon and other railroad tunnels through the Alps include the advance in both headings. Dividing it between the two, the daily advance in a single heading has been about the same, 8 feet to 10 feet, that has been accomplished in the mine tunnels in the United States.

WHILE it is desirable to have a margin of safety against bursting from pressure in hydraulic mining pipes, the margin need not be as large as required for more permanent constructions. A safety factor of 1.75, or even 1.5, will be ample and will prove quite an advantage where transportation costs are high, as a thinner iron can be used.

IN Montana a cubic foot of water (7.48 gallons) per second of time is the legal standard for the measurement of water. Where water rights expressed in miner's inches have been granted, 100 miner's inches is there considered equivalent to a flow of 2½ cubic feet (18 7 gallons per second); 200 miner's inches equivalent to a flow of 5 cubic feet (37.4 gallons) per second, etc.

GOLD AND SILVER can be refined by electrolysis. The process is much the same as that employed in the refining of copper. Thin plates of pure gold or silver are used as the cathode, and on the passing of the current the gold or silver is deposited at the cathode and the impurities either remain in solution or are deposited as the anode sludge. Palladium and platinum impurities in crude bullion from some placer gold are separated from the gold by this electrolytic process and can be recovered from the sludge without much difficulty. The plant required is not large.

THE horse power, the quantity of work required to raise 33,000 pounds 1 foot in one minute, denoted by the symbol H. P., is referred to now as the mechanical horse power, with a symbol written M. H. P. to distinguish it from the electrical horse power, or kilowatt, for which the symbols E. H. P. and Kw. are employed. The electrical horse power is a mechanical horse power multiplied by 1.34048. Electric generators are estimated in kilowatt units and electric motors in M. H. P. units.

IF too much gasoline is being fed to the cylinder of a gasoline engine there is a great deal of smoke and soot formed by the unconsumed fuel. This deposits on the electrodes, causing failure to spark and there is no ignition. If there is an auxiliary exhaust port soot deposits in this and, mixing with the lubricating oil, forms a gummy, sticky mass, partially or entirely filling up the port and causing back pressure in the cylinder. All the burned gas may not escape, and what remains fouls the incoming charges, so that very weak explosions result and many of the charges do not ignite at all.

THE electric arc used in welding and in blast furnace chills has not, so far as "Concentrates" is advised, been applied to the work of an assay furnace. This last has its special conditions differing from the conditions of the other uses. But there is no reason why trials should not be made till the application of electric heating to assaying and cupelling is successfully made. The possible advantages certainly justify the risk of the cost of the experiments. The electric arc has been successfully applied to the equipment of crucible fusion in the manufacture of aluminum and other metals.

WHEN a secondary or accidental vein crosses a common side line between two mining claims at an angle, and the apex of the vein is of such width that it is for a given distance partly within one claim and partly within the other, inasmuch as neither statute nor authority permits a division of the crossing part of the vein, the rights of the parties will be determined by the priority of location and the entire vein considered as apexing upon the senior location until it has wholly passed beyond its side line, without regard to the direction in which the vein dips, was the rule made by the United States Supreme Court in the case of the St. Louis M. & M. Co. of Montana vs. Montana M. Co., Ltd.

THE responsibility of partles who grubstake a prospector for the expenses incurred by the latter depend on the nature of the agreement between them. If the prospector finds and locates claims, the parties to the agreement become co-owners, but not partners, except by special agreement, in that claim, in respective shares as declared by the terms of the grubstake agreement. Co-owners are responsible for the expense of work on a claim which they authorize. One who as superintendent or agent of the co-owners employs labor on the claim obligates the co-owners to pay for that labor. A grubstake agreement makes an agent with special powers limited to the specific terms of the agreement, verbal or written. Unless specifically authorized by the agreement, the one grubstaked cannot hire labor and incur expenses which become an obligation against the grubstakers.

ERRORS in the patent surveys of mining claims have been corrected after patent has been issued. In one California case the United States deputy mineral surveyor returned the side lines of a survey NW and SE where these lines actually had bearings NE and SW, and returned the end lines NE and SW where the real bearings were NW and SE. The error was discovered by another deputy mineral surveyor in making the official survey of an adjoining claim. The Surveyor General issued instructions to the last deputy to resurvey the claim patented on the erroneous survey and corrected it on the official land office maps. The adjoining claim was surveyed in accordance with the corrected survey. The principal source of error in such surveys arises from carelessness on the part of the surveyor in making connections with the section and quarter section corners and in making connections with the corners of previously approved mineral surveys. Too much of the practice of the early surveyors consisted in measuring these connections on paper on the theory that the sectional surveys were correct—that the preceding surveyor had actually done the work represented to be done. As a consequence errors once started have been carried into a more or less considerable group of surveys.

GOLD does not sift its way through the unconsolidated material with which and on which it is deposited so as to accumulate and make a placer at the bottom on bedrock. On clean bedrock that contains seams it works its way downward through the water removing the silt under the gold and allowing it to sink deeper. Gold would sink through quicksand, but not through merely wet sand, which packs hard when wet. In old channel deposits it is often noted by miners that the pay is in one or more layers or strata, often well above the bedrock. So far as the drift material in and on which it rests, no physical difference can be noted which, permitting the gold to sink through the overburden of the gold-bearing stratum, would not permit it to continue sifting downward until it was collected on the bedrock. The fact is that, once covered from the direct action of the water, the fine particles of gold stay where they are put before they are covered up. Water, however, by removing the unconsolidated material, permits the gold to fall, not sift, lower. A large number of such successive removals of the barren rocks and other wash will accumulate the gold into one stratum, which more often than otherwise is on the bedrock and makes the placer.

IRON ore deposits originate in several modes. Where an assay shows the presence of gold it is a fairly safe inference that the iron ore is the result of the oxidization of what was originally a deposit of auriferous iron pyrite which may or may not have carried copper as well. It will probably disclose itself when the zone of permanent water level is reached, whether or not copper bearing. Here, if it is copper bearing, will be collected as native copper, oxides, carbonates or high-grade sulphides, the copper mineral that is not disclosed at the surface. Below this zone will be found the pyritic sulphides, unaltered save for a gradually diminishing secondary sulphide formation. The richness of the iron ore in gold is not an indication as to the probable richness of the unaltered pyritic minerals. It is, if anything, merely an indication of the extent to which surface concentration has taken place. The richer in gold the iron ore, the greater the concentration it represents. It is advisable to explore such gold-bearing iron ore deposits to depth. There may be a good copper mine underneath. Also the pyritic ore if not so rich in gold is rather more cheaply reducible. The iron ore can only be made to yield its gold by using it as a flux with other ores, which involves the expense of transportation. The pyrite can have its values concentrated by smelting to a grade which will be rich enough to pay transportation costs and still yield a satisfactory profit.

CYANIDE SOLUTIONS from leaching tanks contain free cyanide, caustic potash, gold potassium cyanide, silver potassium cyanide and compounds of baser metals. The gold and silver are precipitated from the solution by means of zinc shavings or zinc dust as a blackened powder on the zinc, the latter metal going itself into the solution. During the process hydrogen gas is evolved, bubbling to the surface. From five ounces to one pound of zinc are ordinarily required for every ounce of gold recovered. In cleaning up the zinc box, the blackened, undecomposed shavings of the first box are transferred to an iron pan; the gold slimes remaining on top of the screen are stirred to make them pass through, after which the screen is removed and washed. The cock at the bottom of the compartment is opened, the slime settled there drawn off into a bucket, where it again settles, after which the clear cyanide is decanted and returned to the zinc box. The collected slime is put in a filter, drained of cyanide and washed with water. The slime consists of metallic gold, silver and copper precipitated from the cyanide. In refining the precipitates they are put in a cast iron pan and subjected to a dull red heat in a muffle furnace. When the roast is complete, the precipitate is treated with hydrochloric acid in pans having mechanical agitators. The residue is washed and dried in filters, fluxed and replaced in the roasting pan, and afterwards smelted into a bar or brick.

BEFORE smelting works are definitely decided on, several points should be settled. First, a supply of ore should be in sight that will suffice to run the smelter for a couple of years. The mere fact of having plenty of copper or lead ore in sight is not sufficient. Other elements enter into the composition of the ore that will enable successful work to be done. If these are absent from the ore, the deficiency must be supplied by obtaining them elsewhere and adding them as fluxes. Again, the question of water is a very important one, especially in the case of a water jacket furnace. There arises the all-important question of fuel, the neglect of which has been the ruin of many a plant. In the coke of this coast there is usually a very large amount of ash—about 14%, or even more—although first-class coke for smelting should not contain over 8%. Smelters are often built to perform only the first operation, the preliminary concentration of the metal in matte, which is subsequently shipped to a refinery elsewhere. This point, whether a refinery should be built in connection with it or not, is a matter which requires careful consideration. The cost of fuel, railway transportation charges and the available capital, are the matters which will enter into the decision as to this. Suitable ground must be found for the works, where gravity may be utilized to carry the material from its point of delivery into the works to the point where the finished product is to be delivered into the cars for shipment at the lowest level, as it is in saving a few cents at different points that the profit is to be made. Handling the slag is a more important item than many imagine. At first, when there is no great length to carry it, this is a small matter; but with a smelter turning out 100 tons of slag daily, the dumps very soon grow and the haul becomes a large one. Pouring into a stream of water, and thereby granulating it so that the rounded particles can easily be carried away, is a good method. The manager of the smelter should be a man who has long experience in such works, and not, as is often the case, a successful grocer or sea captain; and he must have a good analytical chemist, on whom he may rely, in charge of the assay office, as unless he knows the composition of the ore he is dealing with day by day, he cannot so mix his charges as to obtain a perfect saving.

Quicksilver.*

By R. S. Baverstock.

Hydrargyrum, meaning "water-silver," a Græco-Latin name for quicksilver, is evidence to us that this metal was not unknown to earlier races. Pliny, who lived about 40 A. D., named it "minium," a term in late years applied to "red lead" by the Saracens. Paracelsus tells us of the use of quicksilver in medicine, and 300 years B. C., Theophrastus mentions it as a derivative of "cinnabar." This much for its history in Europe. On the American continent its use and the knowledge of its existence are of greater antiquity. The Indians, in places where the metal occurs in California, were found by the "white man" decorated with vermillion paint made from (quicksilver) rock. Going southward through Mexico into Peru, a country whose ancient civilizations are only just being brought to light, one can safely reason that with the knowledge and capabilities shown by those race builders of early days, quicksilver along with other minerals received its fair share of their attention. Undoubtedly much of the wealth won from the earth, by such races as the Incas, Aztecs, and later by the Spaniards, was secured by the aid of quicksilver from the Peruvian mines. Even up to the year 1700 these Peruvian mines held the first place for production of the metal, which after that period began to rapidly decrease, and Spain, followed by Austria as second, began the transference of the banner production from South America to Europe. Within the last fifty years North America has entered the field, wresting second honors from Austria and steadily overhauling Spain. The order of production is now:

Spain, 38%; United States, 28%; Austria, 13%; Russia, 10%; Mexico, 6%; Italy, Peru and others furnishing the balance.

Occurrence.—Quicksilver is found in very many countries, but in few only in paying quantities, among which are Peru, Mexico, Brazil, California, Oregon and Texas on the American continent; Spain, Russia, Austria, Italy in Europe; Australia, New Zealand, Borneo, China and Japan. The principal producers have been enumerated.

The various deposits are by no means confined to one formation; the following are some of the different occurrences: In Spain, at the Almaden mines, the deposits occur in the Silurian rocks, in sandstone and quartzite interstratified with slate and limestones; in America (California), in metamorphic rocks—serpentine and sandstone; in Austria, among rocks of the Triassic period; in Russia, Carboniferous; in Italy, in the Tertiary; in Mexico and China, in limestone; in New Zealand, in andesite.

The most frequent occurrence of the mineral is in form of a sulphuret—cinnabar—easily distinguished by its handsome and attractive appearance, being a rich vermillion color when scratched with a knife. Its presence in the rocks is attributed to deposition from solutions. It is not infrequently found in combination with other metals—in California, Colombia and Coquimbo with gold and silver, and in Europe with zinc blende.

A black sulphide is also found, known as metacinnaharite; also a liver-colored form of cinnabar. In small quantities, imprisoned in the rock in fine globules, it occurs native. It sometimes occurs in chloride form as horn mercury or calomel, and as selenide and sulpho-selenide.

Characteristics.—Quicksilver is the only metal that has the property of remaining fluid at ordinary temperatures. It freezes at —30°, forming a ductile tin-white metal.

The specific gravity of mercury is 13.59. It vaporizes slowly at ordinary temperatures, boiling at 360°. It has a great affinity for other metals, chiefly gold, silver, copper, etc., and these properties have been turned to account with much profit in metallurgy.

Production.—The largest mine worked to-day is the Almaden mine in Spain, which has been worked almost continuously for 2400 years. This mine alone produces almost one-third of the world's production. So valuable is the property that when Spain needed money during the late war with this country, European financiers advanced the Government considerable money, being secured by a concession to operate the Almaden mines. The ores worked in the early days are said to have averaged nearly 40%. They have decreased in percentage until to-day 8% ore is considered quite good. It is in this respect a better grade of ore than is run anywhere else, the average run in Austria being 0.8%, Russia 1%, Italy 1.2%, California 1.3%.

The mines of Italy were first worked by the Etruscans, the Russian mines by the Greeks, the Peruvian mines by several successive races, the Spanish mines by the Moors. Some work in China has been carried on for many years; the mines situated in the province of Kivei Chaw are now being operated by a French company. During the war, however, work was suspended.

A few references to the smaller deposits may as well be made at this point; the larger deposits of Spain, Austria, Italy, Russia and California will be treated later.

In Mexico, the production does not nearly supply the demand of the mines, and quicksilver has to be imported. Like other countries, the mines have been stripped of their high-grade ores, and only at the present time, with improved furnaces, are the immense deposits of low-grade ore receiving attention. The chief mines are at Huitzuco, where the cinnabar occurs in sandy, clayey formation in fissures. These radiate out in pipe-like form from nuclei, generally in the cones of small upheavals (a similar occurrence is noted in San Luis Obispo county). The rich streaks were first extracted and retorted in a crude way, only about 50% of the metal being recovered. In later years, however, furnaces have been erected and the low-grade ores worked. From 1886 to 1890 1.01% ore was worked, average price $70; from 1890 to 1893 .91% ore was worked, average price $75; from 1893 to 1896 .62% ore was worked, average price $65 to $91. Besides the increase in price, the production has steadily improved.

At Guadalcazar, north of San Luis Potosi, an English company is working a small deposit. The ore occurs in veins and pockets of gypsum. It averages well, running from 2% to 3½%. In distilling about 85% is recovered.

Peru.—The greatest mines in Peru are at Huancavelica. The production is nominal to what it used to be. Prior to 1700, Peru led the world in the production of mercury, having a greater record than even Spain. Undoubtedly the rich silver mines of the Aztecs and the Incas were supplied with the quicksilver produced in the Peruvian mines. Now, however, they produce only a few tons per month.

But little is known of the Brazilian deposits, and also those of Madagascar. Borneo has a production of some 1600 flasks annually, equal to that of Texas. This covers the minor deposits of the world, with the exception possibly of Hungary, where quicksilver is extracted as a by-product from the spathic iron ores.

Methods of Reducing Ores at Almaden, Spain.—There are three principal deposits, which extend about 200 yards along the strike of the vein. They are regarded as being 40 feet in width and averaging 10% Hg. The mines, of course, after so many years exploitation have a large amount of development work accomplished. They were worked by the Moors and have always been a source of great revenue to the country. In the early days the rich seams were worked—the high-grade ore being sorted over and worked in a simple method which must have been very wasteful. A number of clay retorts were filled with ore and placed in a furnace. These retorts were connected by pipes with the outside of the furnace, the fumes being conveyed through a condensation pipe into aludels or clay vessels of peculiar mold which were kept half full of water. As soon as the heat was sufficiently raised the fumes commenced to pass from the furnace into the condenser pipe—thence into the aludels, where it is condensed into metallic mercury. This method was very wasteful. It gave way later to an improved method by which more ore was worked. The ores were roasted in a furnace shaft, coarse low-grade ores being first placed on the arch, which was perforated to admit the heat from the fire below; above this was placed the rich ore. The entrance was closed with tiles and the mass heated up. The mercurial vapors as they ascended were collected in a chamber, thence led out onto a sloping roof having twelve rows of aludels containing forty-four in each row; there being twenty-two sloping downward, and beyond that twenty-two sloping gently upward. The bottom of the aludels were perforated, permitting the mercury to escape and gather in a trough at the hollow between the rows. The aludel, it may be of interest to explain, is an Arabic term for a pearl-shaped vessel made of clay, having a large aperture at one end into which the small aperture of another aludel can be inserted, the idea being to obtain surface in enclosed spaces in which metallic mercury could be condensed from the vapors. The vapors that passed through the aludels were conducted into a tower and through water in the bottom of it, being finally allowed to escape into the air; this method was known as the Bustamente process or furnace. In comparing the processes of reduction, we find that in later years improvements have been made in the Californian mines which have been adopted in Europe and vice versa.

The improvement on the Bustamente furnace was the intermittent furnace, the capacity of which was gradually increased up to 100 tons; as, however, the process of distillation, charging, heating and cooling off the furnace occupied an entire week, and sometimes longer, this method gave way to the continuous process now usually adopted.

It must be borne in mind that in earlier days the entire product of the mines was not reduced, nor is it so to-day. The ores are carefully sorted—the rich ores in the mine, the balance in the sorting sheds. The ores are usually passed over screens of 1 inch; what passes through is in California termed "tierras," and at New Almaden carries from 1% to 3% mercury; in Spain it is called "vaciscos." The larger ores are closely sorted and in California about five-sixths rejected. This is again sorted and the larger and richer ores culled and called "granza," carrying 6% to 8% mercury; in Spain it is called "metal," carrying over 15%. This is again screened and the smaller particles called "granzita" in California and "requiebro" in Spain. Taken out in California these carry 1% to 3%, in Spain 7.15%.

The poorest grades of refuse are in California called "terrero," and in Spain "china." The fine ores in California used to be mixed with clay and formed into "adobes," which were sunbaked and then roasted. A charge for an intermittent furnace of 100 tons capacity was about as follows: 73 tons granza, 7% to 8% ore; 9.6 tons terrero, low-grade refuse; 6 tons tierras, tierras of about 1% to 3%. This was covered with sheets of iron and luted down. The charge required about five days to roast and three to cool. The estimated cost of reduction was about $1.36 for fuel and labor per ton of ore.

The next improvement was the continuous furnace, adopted first in the form of monitors, with a capacity of twenty-one tons per twenty-four hours.

The size of furnace was as follows: 6 feet wide, 11 feet high, terminating in a cone frustum 8 feet deep. When operated the furnace was first filled to the depth of the fireplace with spent ore, above this 3 feet of "granza" mixed with wood or charcoal. A good fire was maintained in each of the three fireplaces with which the furnace is furnished, until a cherry-red heat is obtained; some of the spent ore was then removed and a charge of ore introduced at the top of the furnace. The gases collected in the space over the ore and thus served to heat the next charge, passing off through an outlet pipe into the condenser. The cost of working this furnace per ton of ore is given as 90 cents for fuel and labor.

The next advance was the Hurtner & Scott continuous furnace, adapted to fine ores. It differs from the preceding in that each furnace is so much narrower in width, being only about 2 feet wide, 27 feet high and 12 feet long; two are built side by side. This was the first introduction of the slanting tiles, which were made 36x16x3 inches. A space of only 3 inches intervened between the projecting end of the upper tile and the face of the lower one. This furnace is reported to handle one ton of ore in forty minutes, the cost being reduced to about 64 cents per ton for fuel and labor.

About the last improvement to be referred to is the continuous furnace in use to-day which does away with a separate furnace for the fines, all the ores being roasted together in a continuous furnace.

Ore bin; ore drying over first condenser; feeding floor; furnace 22 feet long, 16 feet wide, 37 feet high, securely braced and bound, built of brick, underneath supported on iron plates adapted to save mercury which may work through the bottom of the furnace; furnace has four compartments, divided in three sections.

There are twenty-four shelves in each of the four compartments, 6 inches intervening space between tiles, ore automatically discharged every fifteen minutes, introduced every hour, tailings washed away with surplus waters from the condensers; the ore in its passage through the furnace occupies twenty hours; capacity fifty tons; amount of fuel required, two and one-half cords of wood.

Draft, running into vapor chamber, thence through big pipe 30 feet long into first condenser. The fumes leave the furnace at about 372° C., enter first condenser at 191°, third 37.8°, leaving the sixth or last condenser at 13.9°, and enter chimney at 13.3°, only about 0.5° above external temperature.

Some of the heats in the furnace chamber are worthy of note: Combustion chamber, 800° to 900°; first tier, 700° to 800°; second, 500° to 600°; third, 500°; fourth, 360° to 400°; outlet, 260° to 360°. In Europe four sections are used instead of three.

There goes over to the first condenser, besides the fumes, first, fine particles of ore and ash, soot; second, condensable—mercury, water, sulphates, mercurial salts, sulphuric acid; third, gases absorbed by water, sulphuric acid, ammonia, hydrocarbons.

In Europe the fumes are passed through iron pipes first; these are lined with cement to prevent the acids from attacking the iron; water is kept constantly flowing over them; two sets are used, the pipes being elliptical in shape. One set is in use, while the other is being cleaned out; 90% is recovered in the first chamber using this process.

In California, the fumes are conducted to the condenser, which is a large chamber divided, as shown, into three chambers, subdivided by thin board partitions to give greater cooling space. The greater part of the recovery takes place in the eighth compartment of the first condenser, gradually decreasing and producing almost nothing in the last two or three condensers.

Considerable care has to be exercised in the working of the low-grade ores, for various reasons, chief among them being, that in low-grade ores the amount of mercurial vapors is very small, and on account of the large amount of gases from the hydrocarbons, it is difficult to collect the fine particles of the metal. There is carried over, moreover, with the vapors and deposited in the condensing chambers, a material called "stupp," which is of black, sooty appearance, containing a considerable amount of metallic mercury very finely disseminated through the mass and some oxide. Only about 30% of the quicksilver is recovered in the condensers, the rest

* Read before the Los Angeles, Cal., Academy of Sciences, Geological Section.

being held in the "stupp." This is removed, mixed with lime and ground; from this treatment about 90% is recovered, the balance of 10% being transferred hack to the furnace and roasted again.

Efforts have heen made to concentrate low-grade ore, hut the cost of milling and concentrating generally exceeds hy a considerable amount the cost of simple roasting, and hesides the difficulty encountered in saving the fine particles of cinnabar, which has a great tendency to slime, causes a heavy loss in the process. In Italy, where the attempt was made for several years, the tailings, averaging over 1%, are now being roasted at a good profit, but much loss occurred hy reason of washing away of quantities of tailings.

CALIFORNIA.—The California mines are mineralizations along faults occurring hetween the metamorphic and unaltered formations.

The sandstone and shales are the unaltered formations, and the serpentine the metamorphic. Where there is a clay gouge the ores are confined to the vein, the clay forming an impenetratahle barrier. This clay, frequently called "black alta" hy the miners, a Spanish term applied from its frequent occurrence on the hanging wall, is taken as a good sign and is usually followed in the quest for ore.

Where, however, the mineralization has not heen confined, the cinnahar has impregnated the sandstone and sometimes has left the vein barren; this has proven misleading and sometimes unfortunate, for without proper developments to ascertain the extent of the ore body, plants have heen erected which could not he kept running.

In tracing the course of the helt it is not unusual to find that the sandstones are on one side of the vein, and within a few miles they will he encountered in the other.

The New Almaden mine is the deepest quicksilver mine in California, having heen worked to a depth of over 2500 feet. Like all other mines in the early days, it was gouged for its rich ores, the ores reduced in early times heing estimated to carry 36%. It has 70 miles of workings, and since 1845 has produced nearly 1,000,000 flasks of quicksilver. On the 600-foot level a large hody of ore was opened up 45 feet wide, 16 feet thick, which was followed 650 feet; this was overlayed with "alta;" penetrating this another hody of ore was discovered overlaying it, of unknown extent and value. There are eight furnaces to treat the ores. The mine has produced over $45,000,000 worth of quicksilver.

The Sulphur Banks is well worthy of mention, as the property has recently heen acquired with others hy a New York syndicate.

Quicksilver is heing deposited to-day at these mines, which were first worked for their sulphur. Penetrating helow the surface, cinnahar was encountered, which proved richer as depth was gained. The workings are extensive, and up to 1890 this was the second largest producer. Most of the values were extracted from the open-cut work. Very heavy timhering has heen necessitated; springs of hot mineral solutions are encountered in the mine, which make work difficult, especially in the stopes.

The Napa Con. (Oat Hill) has three veins with a large amount of development work; the capacity of the plant is fifty tons.

Many of the old mines, owing to the active demand for the metal, are heing reopened; amongst others worthy of mention are the Oceanic and Klau mines, in San Luis Obispo county, both old producers. The Pine Mountain Co., also in the same county, has successfully opened up large hodies of ore.

There are eight producing counties in California. The order of their production is as follows:

County.	Mines.	Production.
Napa	Ætna, Oat Hill, Manhattan, Redington, Vallejo	8,724
Santa Clara	New Almaden, Guadaloupe	5,145
San Benito	New Idria	3,990
Lake	Sulphur Banks, Abbott, Bullion, Mirabel, Great Western	3,165
Trinity	Altoona	2,294
Sonoma	Great Eastern, Sonoma, Cinnabar King	2,209
San Luis Obispo	Pine Mountain, Oceanic, Karl Klau, Mahoney	515
Colusa		275
Total		26,317

In the face of a steady advance in prices, the production of the California mines, with one exception, during the past five years has steadily decreased. This has not been confined to California, as shown hy the following statistics:

	Austria.	Italy.	Mexico.	Russia.	Spain.	U. S.	Total.
1895, tons....	535	199	213	434	1506	1179	4069
1900, tons....	550	220	335	340	1111	967	3523

The present price of $48.50 per flask should materially advance, when the fact is taken into consideration that the South African and Chinese markets are hardly yet reopened. The following countries annually import quicksilver extensively:

England	$2,000,000
Japan	156,000
India	120,000
China	100,000
Russia	10,000

USES OF MERCURY.—On account of its affinity for metals, especially gold and silver, mercury is used to amalgamate these metals, when disassociated from their gangue, in the mills. We can realize somewhat the value of mercury if we will stop for a moment and think how would the amount of gold and silver now in use have been recovered without its aid.

This use consumes a large amount of the yearly production, there heing a considerable loss in the milling process, hy loss in tailings, flouring, and recovery from the hullion. But, besides this, mercury has had from the earliest times its uses in the arts, being known in medicine and used for many cures. Recently a large amount has heen requisitioned in the new electrolytical process for preparing chlorine and caustic soda. There is but little loss in the operation, however, and a works once well supplied requires but little more.

To produce one ton of caustic soda weekly one ton of quicksilver is required, it heing used as a bath and selected hecause not affected hy the gases generated in the process.

Probahly one of the largest uses to which it is put, outside of milling, is the manufacture of vermilion paint, which is carried on chiefly in China and England. The processes in all countries where the manufacture is carried on are supposed to be secret. It is somewhat remarkahle that with the production of California our quicksilver should be exported to England and China to he imported as paint. After studying some of the methods employed in manufacture, I find there is considerahle difference in proportions of sulphur and mercury and foreign elements introduced. For instance, in Holland, seven pounds of mercury to one pound of sulphur; in China, two pounds of mercury to one pound of sulphur; in Austria, five pounds of mercury to one pound of sulphur.

The proportions used in England I am unable to ohtain. The method of manufacture is as follows: The charge according to methods in Holland is first well mixed and moderately heated, producing a hlack compound called hlack "æthiops." This is introduced into long subliming pots in charges of twenty-five pounds four times an hour; as the charge is added it ignites and when flames have subsided the pot is covered with an iron plate and further heated. The process occupies thirty-six hours. The vermilion is taken out and ground, elutriated and dried.

The same process is followed in China on a more crude method, but the Chinese product is valued for its rich carmine properties. In the second part of the process the charge is introduced into a fixed iron pan, which is covered with hroken tiles and then covered with a pan 4 inches smaller. The space is luted between and four holes left, a hrisk heat is applied and kept up for eighteen hours. When cool the vermilion is taken out and ground. Alum and glue are added to the mixture to facilitate the precipitation of the vermilion in various grades—the poorest is worked over again.

A wet method is also employed which enables the manufacturers to produce a very fine quality. A description would employ too much time and technicality.

The paint of commerce is much adulterated with red lead, chrome red, and frequently gypsum. They are easily detected.

Another production is fulminate of mercury, an explosive of great force. This is made by mixing one part of mercury with ten parts of nitric acid. Alcohol is added, and a white precipitate formed.

Care has to be exercised in the process as the gases evolved are very poisonous. The explosive force exercised is greater than that of gunpowder, and is too sudden for use in guns.

Mixed in larger proportions with saltpetre and sulphur and water it is ground and used for percussion caps, heing coated with varnish to protect it from dampness. Two pounds of mercury converted into fulminate is sufficient for the preparation of 57,000 caps used hy sportsmen.

Further uses of mercury are found in medicine, and in the manufacture of mirrors, harometers, thermometers, lahoratory and mechanical instruments.

DELEGATE SMITH of Arizona has offered a bill in Congress which provides that all of the mineral lands on Indian reservations in Arizona shall he open to entry, location, development and operation hy citizens of the United States, subject to the laws now in force with reference to other puhlic lands. It is provided that, in addition to the requirements of the general law, all parties locating and operating such claims on mineral lands shall pay to the Secretary of the Interior 5% of the net profits derived from such mineral claim. Such payments are to be used as a trust fuud for the henefit of the Indians upon whose lands the claims are located.

THE total exports of silver from British ports and from San Francisco to the Far East for the ten months ending Octoher 31, 1901, are $44,085,766, as compared with $52,483,723 in the same period in 1900. Japan has ceased, or nearly so, importing silver. The chief change has heen in the heavy decrease—47.7%— in the sales to China. At the average prices of the year the shipments to the East for the ten months of the current year have taken approximately 74,000,000 ounces of fine silver.

The Chemical Analysis of Portland Cement.

BY RICHARD K. MEADE.

A common error prevalent among engineers and cement users in general is the belief that a chemical analysis of Portland cement is of little value to any save its manufacturer. They hase their opinions upon the fact that a mixture of quicklime and clay might have the same analysis as Portland cement, and yet the mixture would have no hydraulic properties. It is true that chemical analysis taken alone gives no certain indication of the quality of cement, yet, on the other hand, if made in connection with some of the simplest physical tests it hecomes a most reliahle aid to the engineer in forming an opinion.

The chemical composition of Portland cement is very regular, and the limits of variation in the percentage of any element are very narrow. In a table recently made out hy the author, containing over 100 analyses of many American and German cements, the limits of variation were as follows:

Silica	20.95 to 23.48
Alumina	5.51 to 9.74
Ferric oxide	2.28 to 4.95
Lime	58.93 to 65.59

Chemical analysis alone will not show the character of cement, because the hydraulic properties depend upon the thoroughness with which these elements have heen comhined hy mixing and hurning. If, however, in a cement these elements are incorrectly proportioned, no amount of hurning can make a first-class cement.

Manufacturers and cement chemists now agree fairly well that the hydraulic properties of cement are due to certain definite compounds. While the proportion of one compound to the others is variahle, the percentages of each element which go to make up a specific compound are fixed. From this it follows that if we know the percentage of any given element in a cement we can calculate the quantity of the other elements which must he united with it to form a definite compound.

Newberry, Le Chatelier and others now agree that hydraulic properties of cement are due to the presence in it of a certain aluminate, ferrite and silicate of lime. Newherry and Le Chatelier hoth give the formula $3CaO.SiO_2$ to the most important of these compounds, silicate of lime. Taking this formula as correct, it will he seen that for every 60 parts hy weight of silica present in the compound there must he 168 parts of lime, or for 1 part silica 2.8 parts lime. The aluminate of lime has the formula $2CaO.Al_2O_3$ according to Newherry and $3CaO.Al_2O_3$ according to Le Chatelier. The first of these formulas is more probahly correct, as it agrees closely with the hest practice. Taking this as the formula for the aluminate of lime, it will he seen that for every 102 parts by weight of alumina there must be present in the compound 112 parts of lime, or for 1 part alumina 1.1 part lime. From this Newherry deduced the following "Hydraulic Index" or ratio hetween the acid and basic elements of cement:

$$\text{Per cent lime} = \text{per cent silica} \times 2.8 + \text{per cent alumina} \times 1.1.$$

The composition of most well-known Portland cements is very similar to the ratio shown hy this formula. That they do not agree exactly is due to the fact that this formula represents the maximum percentage of lime admissible for any given percentage of silica and alumina. Why the maximum is never reached safely will he shown presently.

It will he seen that while the ahove formula fixes the percentage of lime for any cement the percentages of alumina and silica may vary. Practice, however, and the recognized properties of the compounds themselves regulate the proportions of the two, for the silicate of lime gives the hardening powers to cement, while the rate of setting is controlled hy the aluminate of lime. Portland cement usually contains from 5% to 10% alumina and oxide combined. Iron oxide counts as alumina, since its properties are similar. As the percentage of alumina rises in cement, other factors being equal, it becomes more and more quick setting.

The maximum percentage of lime as shown by Newherry's formula is seldom attempted hy any cement maker because of the danger of an excess of free lime in the cement. In order to get the silica, alumina and lime to combine it is necessary to grind and mix the raw materials very thoroughly and burn until the lime is all combined. If the grinding is not fine enough, the mixing not intimate enough, and the burning insufficient, some of the lime will remain frce or uncombined and cause the cement to crack and expand in hardening.

The compounds contained in cement may he classed under three heads:

1. Compounds with hydraulic properties, such as the silicate and aluminate of lime.

2. Compounds deleterious to Portland cement, such as magnesia, calcium sulphite, calcium sulphate, free lime, etc.

3. Inert compounds, such as uncomhined clay, sand, calcium carbonate, etc.

Chemical analysis will show per se if such deleterious compounds as magnesia, calcium sulphite, cal-

cium sulphate are present in quantities sufficient to injure the cement. The analysis will also show us if the cement is of normal composition. Even if the magnesia, etc., are under the limit, cement with abnormal proportions of the chief constituents, unless wanted for some special purpose, is to be looked upon with disfavor.

Calculation from the chemical analysis, using Newberry's formula, will readily show if the maximum of lime has been exceeded, or if the percentage of lime is far under this. The analysis can be made to show the percentage of uncombined clay or silica, and the calcium carbonate can, of course, be determined.

The Cost of Mine Patents.

Written for the MINING AND SCIENTIFIC PRESS by THEO. F. VAN WAGENEN, E. M.

By the average miner the patenting of his claim is regarded as a matter of so great expense that he generally prefers year after year to perform the annual assessment, $100, upon it—even long after the $500 worth of work is done which must precede patenting—rather than apply to the Government for a perfected title. Of course, this annual assessment rarely costs him in cash more than $30 to $50 and, in a great number of instances, involves merely enough outlay to provide him with food during twenty to thirty days' of easy work; and so the burden is light. But in the case of non-resident owners, who actually pay $100 in cash to some miner to perform the work, the item is often a serious one.

It is a condition of affairs that should be changed. The mine patenting system, as it is now operated, is susceptible of great improvement by comparatively slight modifications of land office practice, and enormously valuable benefits to the mining industry would follow if certain changes were made which would encourage the miner to perfect his title within three to five years after making his location. Much of the distrust that is connected in the minds of investors with metal mining as a business, is the result of unfortunate experience with titles. They buy mines which prove by development to be valuable, and then, sometimes on account of the carelessness of the locator in defining his boundary lines on the ground, or in the location certificate, or through the knavishness of others who make it a business to take advantage of such defects, find that either they do not own the ground they have bought or will be compelled to expend vast sums in court to protect their purchase.

Of course, every one engaged in mining in the West has his opinion about the national mining law. Many are in favor of altering it so as to exclude extra-lateral rights. Others would have square locations. Some have suggested Government control of the act of location. But the law has now stood for so many years without material amendment or change, and has been elucidated so thoroughly by department rulings and court decisions, that it is very doubtful whether as much general benefit would result from radical fundamental changes, as through additional rulings along common sense lines, as occasion called for them. And, in my opinion, none could at the present time be more timely than those which had for their object the simplification of the process of patent application and the lessening of its cost.

Much has already been done towards that end. Thus, not many years ago, each claim under identical ownership had to be the subject of a separate application; whereas now any number of adjoining claims so owned can be put through under one set of papers; disconnected mill sites can now be applied for in connection with lodes owned by the same parties. Improvement money ($500 per claim), as well as the annual assessment money ($100 per claim), may now be expended in certain cases on one claim of a group, to the very great advantage of the owner, instead of, as formerly, being spent on each claim. Again, the miner has himself taken a hand in the simplification of the business in certain places by voluntarily abandoning—as at Leadville, Colo., for instance—all extra-lateral rights; and many wise mining operators have followed his example by making it a practice to buy up or take up adjoining territory before proceeding to development, so as to avoid all possible complications that might result from the departure of their vein in its dip beyond their side lines, or of the apex on its strike from their surface boundaries.

To sum up the situation, it may be concluded that the American mining law will not be fundamentally altered: first, because, as at present operated, it is an inherently American system and contains features which are essentially in harmony with a republican form of government, in which the individual is generally left to take care of himself, or suffer the consequences if he does not; and, second, because the Western miner has become thoroughly used to its workings, and, on the whole, likes it with all its faults. And it being shown that, through the process of court decisions and department rulings, a great deal of improvement has been already effected, the disposition is to allow the process to go ahead naturally as experience points out the way.

It is along these lines, therefore, that I venture to make some suggestions. And, as the actual details of patent application are still so much of a mystery to a large number of miners and mining operators that they consider it necessary in nearly all cases to employ an attorney to attend to the business for them; and as there is an astonishing ignorance among many attorneys, even in the West, of the vital features of a mining application, I shall explain the process with some detail, in the belief that by doing so the way will become clear for a demand among mining men for such additional department rulings as will accomplish the ends desired and thereby encourage the perfecting of mining titles. That such a result would greatly stimulate and improve the mining industry there can be no doubt. Vast amounts of capital are ready for investment in mines, if titles of assured strength can be had; and thousands of individual miners would gladly patent their claims if they could do so at moderate cost, or upon the installment plan, which is at the command of the farmer who wishes to own land. Thus, much money would come to the West, and much new ground would be open for taxation.

The first prerequisite to a patent on a mining claim, either lode or placer, is a proper location certificate on record at the recorder's office of the county in which it is situated. This must give the name of the claim, the name or names of its locators, the date of its location, the length and width in feet of the ground claimed, the direction or course of its center line, and such a description of its situation and corners as will permit a man of average intelligence to find it if he really wants to. A discovery shaft, or cut, or opening, exposing the vein or deposit to sight to the depth of at least 10 feet, must be dug, if it is a lode claim, or an excavation deep enough to prove the mineral character of the material, if it be a placer. A stake or monument of some kind must be erected by the side of this excavation, and a written notice, setting forth all the foregoing facts, must be posted on the stake, or placed upon or within the monument. The certificate must then be recorded. These are the essential features of the United States mining law. In addition, there have been enacted during recent years in every mining State and Territory in the West additional State regulations, prescribing the maximum size of the claim, the method of marking its boundaries, and the extreme period allowed after the act of location for recording. Miners can always obtain printed copies of these laws by corresponding with the Secretary of State of the State in which they are operating.

Of course, the miner is rarely a surveyor, or knows how to use an instrument. Consequently, he paces off his ground or measures it with a tape as best he can. As a result, nearly all original locations are of irregular shape and contain a larger area than the law permits. And as the land office regulations state that the patent application must conform to the courses and corners of the location certificate, it becomes necessary for the miner who initiates patent proceedings, in nearly all cases, to place on record an amended location certificate, giving a description of the courses and distances of his boundary lines accurately, and tying the location correctly to the nearest Government corner or mineral monument. Here comes in his first serious outlay. He applies to the nearest deputy mineral surveyor, who will charge him from $10 to $50 for the job, according to the comparative accessibility of the claim and the difficulties connected with the work. When that official has finished, if he has done his work as correctly as he should, and as he could without giving any extra time and expense to the job, he has really made a patent survey, of which the miner should have the benefit. But he rarely does; for, according to the regulations of the Surveyor General's office, no deputy can make a patent survey until he receives an official order to that effect; and before an order will be issued a correct location certificate must be placed on record and a certified copy thereof sent to the Surveyor General.

So, in effect, the miner is between the devil and the deep sea, and must pay twice for the survey of his claim; for when the survey for amended location is correctly and carefully made, the deputy, when he makes the patent survey, merely goes over the lines perfunctorily and marks the corners, and there is nothing more for him to do but to write up his field notes in prescribed form and make the plat; but he always makes an additional charge for this second survey.

Here, then, is the first chance to lessen the cost of a patent to the miner. Without legislative enactment, deputy surveyors can be instructed, first, to be as thorough in the making of an amended location survey as they now are in one for a patent; and, second, to file at once with the Surveyor General a copy of the plat, description and field notes; and the Surveyors General in each State can be authorized by the General Land Office to use these documents without further additions for the patent application when it is desired, if the applicant so wishes. By such rulings, miners would be relieved of from $50 to $100 in the expense of surveying their ground.

The second prerequisite to a patent application is that $500 worth of work shall be performed on the ground or for its benefit. The requirement is a severe one, far more so than any the agriculturist is called upon to hear, who can also buy his land from the Government at from one-half to one-quarter the price the miner is compelled to pay. Yet it is a question whether the amount can be wisely reduced. But miners should be given to understand more clearly that they have till the end of the advertising period in which to complete this expenditure, and the proof of it should not be called for among the preliminary papers as is now the general practice. Moreover, it might be a wise plan to permit the cost of the patent survey to apply on this sum, or to give the applicant an additional year or two after advertising in which to finish it.

The patent survey being made, the applicant is next under the necessity of filing in the land office of his district a set of papers of a very complicated nature, the preparation of which is almost always delegated to an attorney; who rarely charges less than $100 for his services, and from that up to $500, or even more in some of the sparsely settled parts of the West where there is no competition among the lawyers. Now, when it is understood that these papers from first to last can all be drawn up by any man of average clerical ability and experience in that class of work, and who has a good typewriter at his command, in one office working day; that blank forms of all of them are to be had at the stationers; and that the busy lawyers always turn over such work to their stenographers, giving them blank forms to follow and rarely doing more than to glance over the documents after they are completed, it becomes evident that the miner is very effectually milked at this stage of his progress towards patent. In addition, it is a very rare circumstance for a set of patent papers to go through the office of even the best lawyer in the West without error, while those that issue from the studios of a majority of young and inexperienced attorneys are veritable marvels of blunders. And the reason is plain. Not one attorney in a thousand is competent through education or experience to draw such papers. The bulk of them consist of land descriptions expressed in terms of the engineer, in which courses and distances; degrees, minutes and seconds; sections, townships and ranges; bearings, distances and variations follow each other with a persistence and continuity inexplicable to any one who has not had the training of that profession. And all such papers should be drawn by an engineer and not by a lawyer. In the early days of the mining industry in the United States they always were. It was the part of the Deputy U. S. Mineral Surveyor to make them out. And in their hands the burden on the miner was much less than it is now.

This list of patent papers under ordinary circumstances are about eighteen in number, and may be naturally divided into four classes, as follows:

1. Those which consist wholly or mainly of descriptions of land, viz., notice for posting in land office, notice for posting on claim, notice for publication, application, proof of posting on claim, proof that notice remained posted on claim during advertisement, proof that notice remained posted in land office, proof of no vein in placer or mill site.

2. Those which have to do with the advertisement of the notice of application in the newspaper published nearest to the claim, viz., contract with publisher, proof of publication.

3. Those which have to do with the chain of title of the claim, viz., certified copy of location certificate, proof of non-abandonment, abstract of title, proof of citizenship, articles of incorporation (where applicant is a corporation), power of attorney (where applicant is a non-resident of the district).

4. The so-called final papers, viz., proof of sums paid, application to purchase.

Under the existing system of practice all of these are now either drawn by the attorney or ordered by him from the office of the recorder of the county in which the claim lies. And for this service, to which should be added the transmittal of the papers to the land office, the miner has to pay, as stated, from $100 to $500. But observe how easily (and properly, too,) the whole matter could be attended to otherwise, by the aid of a few department rulings:

Class 1.—These papers could all be drawn in the office of the Surveyor General of the State in which the claim lies, and provided for the claimant, with the field notes and plats, which now come from that source, free of all cost. They are really nothing but extensions of the former, and can only be correctly prepared by officials and employes who are daily and hourly engaged in using the language and phraseology of the civil engineer; and they can do the work in a quarter of the time it would take most any one else. Besides, the fees charged at the present by that department of the Interior Department are out of all proportion to the work it now does for the miner. A surplus of several hundred thousand dollars is accumulating per year from these fees, and a bill is now before Congress to permit of its repayment to mineral applicants of the past—an utterly impossible proposition. But for the future these fees should be either heavily reduced or more given to the miner for them; and it is highly probable that both could be done without involving the Government in any expense. The precious metal miner of the nation has a naturally strong claim on Congress for consideration, yet his is the one occupation of the country that has yielded a cash profit to the Government in the management of its affairs. Many millions have been made by the Government in the operation of

the coinage laws, and already several millions through the regulations in force in the department of mineral land surveys.

Class 2.—The publisher who is awarded the contract for printing the "Notice of Application," for which he is legally entitled to charge at the rate of $5 per inch of column occupied, can be properly instructed by the General Land Office to provide these papers, and no doubt would most willingly comply without any extra charge, for the cost to him would be practically nothing.

Class 3.—All of these papers are obtainable at the offices of county recorders at reasonable prices, except the "Proof of Non-Abandonment" and "Proof of Citizenship." Their books will show the facts in each case, and, if the Government provided the blanks, they would be only too willing to add the business of furnishing certificates at a moderate charge.

Class 4.—These two papers can most appropriately be furnished by the local land office free of all expense to the applicant, including their verification.

All these modifications in practice can be accomplished without Congressional action, therefore they could be brought into action quickly, which is a very important point. Let us now consider what might fairly be expected in the way of results.

There would surely be a rush on the part of mine owners for amended certificate surveys. Many would find themselves able to spare the $25 to $50 for this work, especially if it were applicable on annual assessment account. Moreover, as it would be the first installment of the patent proceedings, many would strain a point to take it, knowing that a further step need not be taken until it was financially convenient. As matters are now arranged, many a miner hesitates to begin application, for after once initiating proceedings he cannot stop without very inconvenient and often serious consequences to his title. It needs no argument to prove that the general mining public, and the prospecting class in particular, would be greatly advantaged by the definite delimitation of claims. Much of the mining litigation now in progress, or that has occurred in the past, has been directly due to the uncertainty which always exists as to the boundaries of unpatented ground.

The survey being the only varying item in the process of mine patenting (if attorneys' fees be excluded), the claimant who had secured his amended certificate could at once calculate accurately what expenses remained to be provided for, and the thrifty ones would be greatly encouraged to push the proceedings to a finish. At the same time those not so provident would be in a much better position to sell.

The cost of patenting a single claim under present conditions, will average about $400. With the modifications in practice which are herein suggested, the expenses would rarely equal $250. In groups of claims the economy effected would be even greater.

Many will believe, however, that the miner will always need the assistance of some professional in patenting his claim, no matter how simple the process is made; and it is likely to be the case. He will be too busy with his own work to give it even the little clerical attention that it would demand. The question then arises, "Would he still have to call upon the attorney for help, or could the Deputy Surveyor act as his professional friend?"

I believe that a thorough consideration of the subject by those most competent to decide will lead to the conclusion that the task of guiding the miner along the road to a patent is more within the province of a surveyor than of an attorney. The former is very often a practical miner himself, and being much of his time on the hills is brought more in touch with the business. He generally understands its phraseology, and always knows how to properly get around the many little foolish requirements in patent application matters which are perhaps the unavoidable result of laws and regulations enacted by men who don't know the difference between a mineral vein and a plank road. The attorney on the other hand, is generally not only a stranger to the miner, but is rarely posted as to matters of the hill and the open, being essentially a city and an office man, who is usually clothed in purple and fine linen and expects to be well paid for keeping himself in so immaculate a condition. If at times he dons the yellow boots and suit of the deputy, his outfit is certain to lack the familiar decorations of candle grease, mine clay and yesterday's dinner, and every one knows it is a hollow pretence for which some one will have to pay when the hill comes in. Of course there are lawyers and lawyers, and many of them are as full of essential manliness and the milk of human kindness as any class of men; but it seems to be the general opinion among the plain people that when Gabriel blows his horn and seats are being assigned at the marriage feast, the legal fraternity as a body will be located some considerable distance from the head of the table. And no doubt there will be some Deputy United States Mineral Surveyors in the same vicinity.

Fifty dollars is a high average cost at the present time for a single claim patent survey. If deputies could be assured of even something less than that amount (net) on each claim surveyed by them, they could easily afford without extra charge to guide the claimant through the details of the process of patenting, attend to the ordering, verification and transmission of all his papers, and make his entry. It is work for which they are naturally better fitted than anyone else, and in my opinion it should never have been taken away from them. As a class they are men who command high respect among mining operators, and, being under heavy bonds, have every incentive to accuracy and faithfulness.

Construction of Mine Telephone Lines.

In the Electrical Review A. E. Dobbs gives some practical suggestions relating to telephone exchange construction which are applicable to the conditions met with in the construction of many telephone lines for mines. In this work for mines the necessity for economy in installation is always urgent. The setting up of a regular pole line is frequently prohibited by cost alone, and recourse must be had to trees as a substitute for poles. The use of these has been found to be subject to some disadvantages and difficulties that pole construction avoids. These difficulties are readily overcome by simple expedients which Mr. Dobbs describes. He says that a tree which forms a convenient support for the wire can have the latter best attached to it by nailing a porcelain knob to the side of the tree, as in Fig. 1,

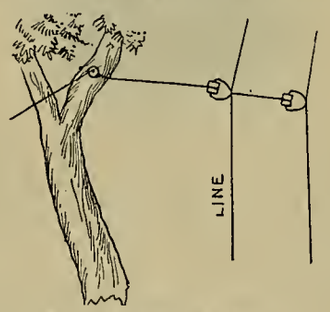

Fig. 1.—Porcelain Knob on Tree.

or a bracket, as in Fig. 2. In order to keep the wires clear of the tree they should be placed on one

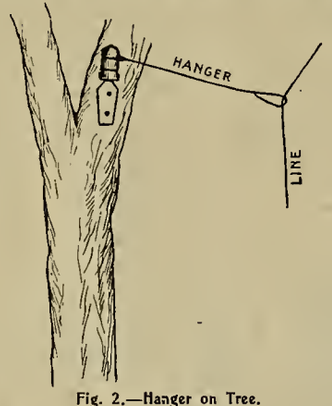

Fig. 2.—Hanger on Tree.

that will pull off at an angle from the rest of the line. For this purpose two trees diagonally from each other are sometimes selected and a long wire attached as a hanger, 10 feet or more in length, which, when the wire is pulled up, allows it to swing free of limbs or foliage. A line can sometimes be zigzagged in this manner for half a mile or more.

In addition to the knob on the tree (Fig. 1) there is also another knob or circuit breaker to each wire, to which the wire loops are attached, thus making two knobs between the line wire and the tree trunk.

Sometimes the wire is passed through the hole in the knob, and sometimes it is tied to the groove and the hanger wire passed through the hole and looped back on itself. Whatever method is used, the wire should be left free to swing with the motion of the tree, and for this reason should not be tied unless the hanger is a very long one and there is no danger of its breaking.

In Fig. 2 the knobs are dispensed with and a single wire with a loop end attached to a bracket on the side of the tree. This is better than the use of porcelain knobs, for the insulation of the wire is in this way maintained in wet weather, whereas the water runs from the outside of the knob and directly to the tree trunk, and the insulation of the line thus becomes no higher than that of the film of rainwater running down the outside. With the glass insulator the place underneath the skirt is nearly always dry and its superiority as an insulator is due solely to this fact.

Fig. 3 shows a method of suspending several wires

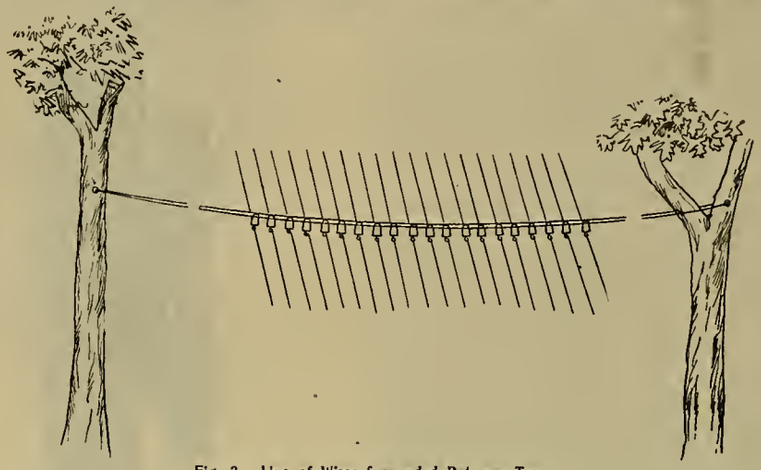

Fig. 3.—Line of Wires Suspended Between Trees.

between trees. The insulators in this case are tied between two No. 9 wires that are pulled from tree to tree, two tie wires passing around the top groove, as shown in Fig. 4.

Fig. 4.—The Wires.

The hooks shown in the bottom of the insulators may be ordinary screw eyes cemented into the glass. The wires may be left suspended loosely in the hooks without tying, provided the screw hooks or screw eyes are so arranged that the wire can not easily fall out. Sometimes porcelain knobs have been suspended on a single No. 6 wire and the line wires drawn through the center holes. This is not as good as the petticoat insulator, however. The insulators should be spaced about 12 inches apart. Access to them can be had by means of a long ladder resting against the span wires. They should be so suspended that the center of the span will not be less than 18 feet above the ground.

An objection to be urged against this form of suspension lies in the fact that if the lines should become crossed one can only reach them by means of a long ladder or a pike pole; but, as there is no reason why these lines should not be pulled taut and even, there should be no more trouble in them than in a straight-away pole line. This sort of a line is not recommended for general use, but is suggested as an expedient where there are few lines and where trees make a pole line out of the question.

C. P. Tonoray and G. E. Boren have arranged with New York people to make the installation of an electric steel plant at Elizabethtown, Tenn. It is claimed that by this method steel ingots can be produced directly from iron ore in thirty minutes. An 8000 H. P. electric plant will be commenced as soon as a site can be decided upon on the Wautauga river, near Elizabethtown.

Prof. J. F. Kemp of Columbia University, states that samples of rock sent into the United States Survey for examination by J. C. Carter of Leavenworth, Washington, contain three-eighths of an ounce of platinum metals to the ton, and finer material from the same locality contains one-half ounce to the ton.

Senator Penrose has introduced a bill levying a duty of 25% ad valorem on all importations of manufactured silver. A preamble of the bill declares it to be the purpose of the measure to protect the silver mining industry of the United States.

To Establish the Department of Mines and Mining.

In the House of Representatives Mr. Woods of the 2nd California District has introduced the following bill; which was referred to the Committee on Mines and Mining:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that there shall be at the seat of government an Executive Department to he known as the Department of Mines and Mining, and a Secretary of Mines and Mining at the head thereof, who shall he appointed by the President, by and with the advice and consent of the Senate, who shall have a seat in the Cahinet and who shall receive a salary of eight thousand dollars per annum; and section one hundred and fifty-eight of the Revised Statutes is hereby amended to include such Department, and the provisions of title four of the Revised Statutes, including all amendments thereto, are hereby made applicable to the said Department.

SEC. 2. That there shall he in said Department an Assistant Secretary of Mines and Mining, to he appointed hy the President, by and with the advice and consent of the Senate, who shall receive a salary of four thousand dollars per annum. He shall perform such duties as shall he prescribed by the Secretary and required hy law. There shall also be appointed by said Secretary one chief clerk, who shall receive a salary of one thousand eight hundred dollars per annum, and such other clerical assistance as may from time to time he authorized hy Congress.

SEC. 3. That the said Department of Mines and Mining shall have general jurisdiction over all matters pertaining to mines and mining industries and the Geological Survey, and over all the matters committed to any of the hureaus, offices, departments, or hranches of the public service hy this Act transferred from other Executive Departments of the Government to the said Department of Mines and Mining as fully as the same is now possessed hy any of the said hureaus, offices, departments, or hranches of the public service from whence the same is so transferred, and that the official records and papers now on file in and relating to the husiness of any such hureau, office, department, or hranch of the puhlic service in this Act transferred to the Department of Mines and Mining, together with the furniture now in use in such hureau, office, department, or hranch of the public service shall he, and is herehy, transferred to the Department of Mines and Mining.

SEC. 4. That there shall be in the Department of Mines and Mining a hureau which shall, under the direction of the Secretary thereof, gather, compile, and puhlish information in respect to the same, and it shall he the duty of said hureau to acquire and disseminate practical and useful information concerning the mines, mineral resources, and mining industries of the United States; that the office of the Director of the Geological Survey and the Geological Survey Service and all that relates to and pertains to the same is hereby transferred from the jurisdiction of the Interior Department to the jurisdiction and supervision of the Department of Mines and Mining, to remain henceforth under the jurisdiction of the latter; and the Director of the Geological Survey is herehy made the director of said hureau.

SEC. 5. That the Secretary of Mines and Mining shall annually make a report in writing to Congress, which shall contain an account of all moneys received and expended hy him in promoting and facilitating the development of American mines, and mining industries, and such recommendations as he shall deem necessary to the further development of the same. He shall also make special investigations and reports on particular suhjects whenever required to do so hy either the President, the Senate, or the House of Representatives.

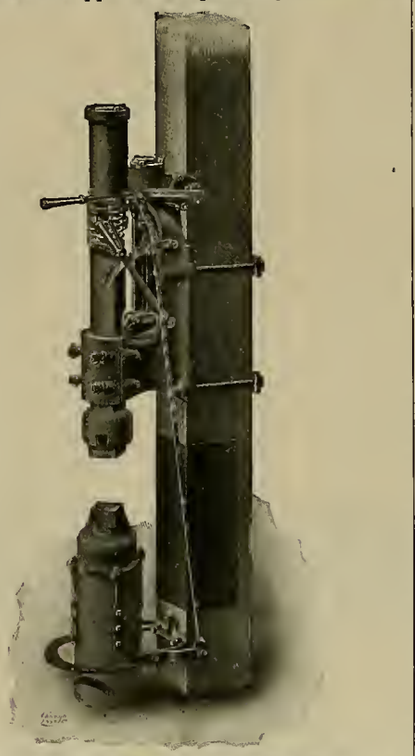
SEC. 6. That the Secretary of Mines and Mining shall have charge in the huildings or premises occupied hy or appropriated to the Department of Mines and Mining of the library, furniture, fixtures, records, and other property pertaining to it, or hereafter acquired for use in the husiness; and he shall he allowed to expend for periodicals and the purposes of the library, and for the rental of appropriate quarters for the accommodation of the Department of Mines and Mining within the District of Columbia, and for all other incidental expenses, such sums as Congress may provide from time to time: Provided, however, that where any hureau proposed to he transferred to the Department of Mines and Mining hy this Act is occupying rented huildings or premises they may still continue to do so until other suitahle quarters are provided for their use: And provided further, that all officers, clerks, and employees now employed in any of the bureaus, offices, departments, or branches of the public service in this Act transferred to the Department of Mines and Mining, are each and all hereby transferred to said Department at their present grades and salaries, except where otherwise proviued in this Act, until otherwise provided by law: And provided further, that all laws prescribing the work and defining the duties of the several hureaus, offices, departments, or branches of the public service by this Act transferred to and made a part of the Department of Mines and Mining, shall, so far as the same are not in conflict with the provisions of this Act, remain in full force and effect until otherwise provided by law.

SEC. 7. That the jurisdiction, supervision, and management and control of mines and mining lands and mining industries now vested in the Interior Department are hereby transferred to and vested in the Department of Mines and Mining.

Hundred Pound Post Hammer.

The American Engineering Works, Chicago, has recently designed a small post hammer, to he operated by steam or compressed air, adapted for all classes of general blacksmith shop work, and intended to be of especial value to mining companies for use in their smith shops. It works quickly, will turn out a large amount of work per day and is thoroughly satisfactory for all forging work 2½ inches in diameter or smaller. This hammer should be found to be a useful tool for railroad, mining, hlacksmith, and shops generally where any forging work is required.

The following cut shows the hammer attached to a post with anvil supported independently.



The action of this hammer is the same as that of a large steam hammer. The ram can be regulated to strike a hlow of the full force developed by the falling weight with the momentum due to the pressure of the steam or air hehind it, or it can be regulated so as to give the lightest possible hlow, merely touching the object on the anvil without doing any work. The cylinder is 3 inches in diameter by 10 inches stroke. It is described as heing cast in one piece, with the frame from the best quality of gray iron, the exhaust ports arranged so as to keep the cylinder always drained. The valve is under control of the operator, and is operated by a foot treadle or by hand lever. Steam valve is controlled hy a cam working on a cam path on the back of the ram, the position of the cam heing governed by the operating levers. There is also provided a safety device to limit the stroke of the piston. There is clear space of ahout 10 inches from center of die to side of post supporting the frame. The hammer is usually arranged for bolting to a wooden post 8x8 inches. Special attachments can he furnished for bolting to a heam or other form of wrought steel column, or where preferred a steel column made of extra heavy wrought pipe will be furnished, together with necessary clamps for properly clamping frame of hammer.

The ram is a solid steel forging, square in form where it passes through the lower part of the frame which acts as a guide. The lower end of the ram is arranged to receive the upper die in such position that it stands at an angle of 45° to the post supporting the hammer, thus enabling long pieces to be worked either way of the die without coming in contact with the post. The upper die is a steel casting, having a face 4x5 inches, dovetailed to the ram and fastened with wedges. The lower die is a steel casting having face 4x5 inches, dovetailed to the anvil and fastened with wedges so that it is easily removable. The anvil is designed to be secured to a 12-inch wooden block set on end, the anvil heing holted to the hlock with lag screws. The falling weight is 100 pounds. The weight of the lower die and anvil is about 150 pounds. The total shipping weight is about 575 pounds. It is furnished hy the American Engineering Works, 204 Dearborn street, Chicago, Ill.

Electrical Expressions and Their Equivalents.

Arranged for Convenient Reference by C. W. HUNT.

ONE WATT.	A rate of doing work.	
	1.	ampere per sec. at one volt.
	.7373	foot-pound per second.
	44 238	foot-pounds per minute.
	2,654.28	foot-pounds per hour.

TORQUE.	Force moving in a circle.	
	A force of one pound at a radius of one foot.	

The Electro-Metallurgy of Zinc.

To realize the appalling wastefulness of the present methods of zinc smelting it is only necessary to bear in mind that in the very hest practice from three-fourths to one ton of coal are consumed in producing from one and one-half to two tons of spelter from a 50% ore. Now, although, of course, the same amount of energy has to be expended in order to isolate one ton of zinc, whether it be chemically reduced or electrolytically deposited, yet the conditions under which the energy is extracted from coal and then utilized are so much more favorable in a good modern boiler, steam engine and dynamo plant than in a zinc-smelting furnace, that the advantages would he all on the side of the electrolytic process, hoth as regards cost of production and purity of product, were only that process forthcoming. But unfortunately the economy of electrolytic zinc extraction processes is not so great as would at first appear. The reason of this is to he found in the fact that in the leach, previous to electrolyis, any silica which may be present in the ore is rendered gelatinous hy the action of the acid, and it then holds a considerahle quantity of zinc solution; consequently filter presses must he used, and even then the extraction is only partial. The formation of this gelatinous silica may be overcome when treating ores which do not originally contain zinc silicate by roasting at a lower temperature, hut in this case the zinc sulphide is only partially decomposed, and consequently is not acted on by the leaching medium.

THE efficiencies of electrical apparatus are usually very good, and range somewhere near the values given in the tahle below, which is for units of 100 H. P. or over, and applies to either direct or alternating current machinery:

	Per Cent.
Generators	90 to 96
Transformers	95 to 97
Transmission line	90 to 95
Rotaries	80 to 95
Motors	85 to 95

The ahove table is a fairly conservative one for this kind of machinery. For smaller units these values are too high, and in some cases of large machines operating under very good conditions they may be too low. The efficiency of transformers and synchronous motors with good power factors is very high and represents the limit of commercial machines.

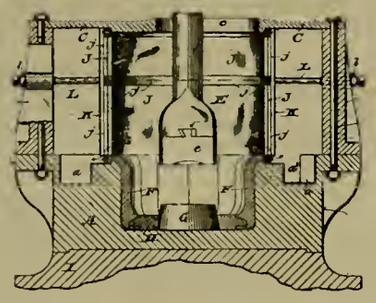
THE Secretary of State states that there is no time limit to the modus vivendi entered into by the United States with the Dominion of Canada. "During the continuance of the agreement," he says, "new claims on the Alaskan side of the provisional line are subject to the United States laws, and those on the British side to the Canadian laws, without prejudice to final adjustment of the houndary. But all rights acquired on either side hefore the modus are unimpaired. It follows that such pre-existing rights of the citizens of the one party within the provisional jurisdiction of the other may he established as of record by any reasonable formality prescribed by the authority in temporary control of the territory where such rights are claimed under the modus."

Mining and Metallurgical Patents.

Patents Issued December 24, 1901.

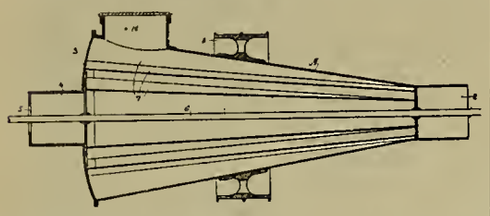
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

STAMP MILL.—No. 689,219; W. E. Parnall, Calumet, and C. H. Krause, South Lake Linden, Mich.



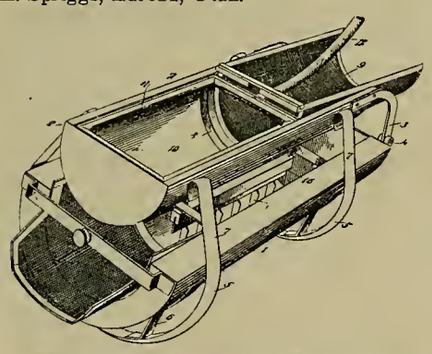
A single stamp provided with a detachable hardened shoe and a mortar having a cavity provided with a removable hardened die and hardened stave-liners constructed and arranged to receive impact of pulp and to direct same upwardly and outwardly on all sides, a removable cylindrical screen surrounding stamp concentrically therewith so as to be approximately perpendicular to direction of splash passing through it on all sides of mortar, and a removable splash-pan surrounding screen and open at bottom so as to intercept pulp passing through screen and to afford a free and constant discharge therefor.

GOLD-SAVING APPARATUS.—No. 689,612; C. G. Hambleton, East Oakland, Cal.



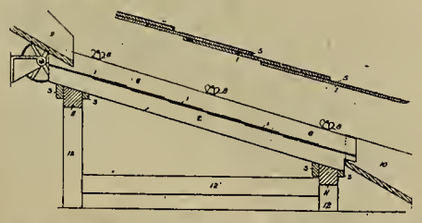
This invention consists of one or more hollow conical chambers having horizontal axes and journals at the ends with means for rotating the chambers. In the interior these chambers are provided with lifting plates or ribs, and a chamber or pocket projecting from the one side of the larger diameter receives the mercury and heavier portions at each revolution and ejects them into the surrounding mass. These depressions or pockets also serve to finally receive and retain the valuable amalgam which settles into them when they are at the lowest point, and by removing a cap the apparatus can be readily cleaned up at will.

AMALGAMATOR AND CONCENTRATOR.—No. 689,695; I. H. Spriggs, Eureka, Utah.



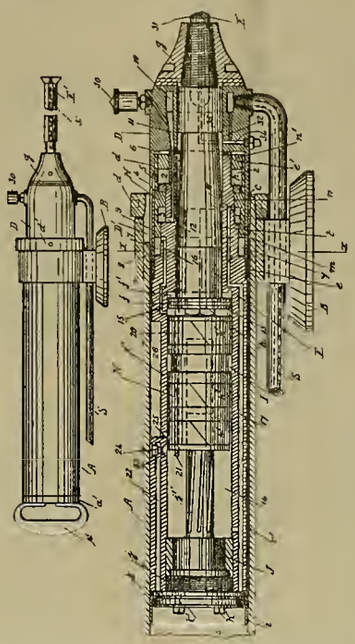
Two semi-cylindrical trays one arranged wholly over other and mounted to rock, a riffle in upper tray, a semi-cylindrical sieve extended from riffle beyond outlet end of tray and adapted to discharge material into lower tray, and a perforated water pipe extended around hopper or feed section of upper tray.

GOLD RECOVERING APPARATUS.—No. 689,733; O. M. Lawrence, Foster, Or.



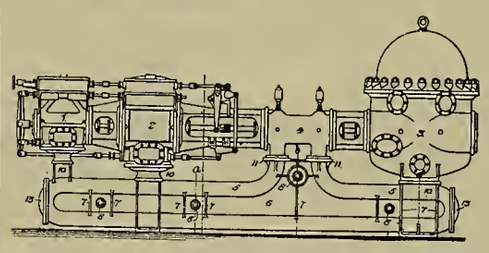
A series of perfectly flat plates adapted to overlap each other, means for holding plates in relative position to each other whereby overlapping portion is constantly same, side pieces detachably secured in place overlying edges of plates and serving to form, with plates, a trough or sluice for material under treatment, driving shafts and eccentrics connecting supports for plate with driving shafts whereby plates may be given lateral movement, upper surface of each plate being thickly coated with amalgam, whereby a layer of same is disposed between overlapping portions of each plate, lateral movement of plates not disturbing relative position of same and not interfering with layer of amalgam carried.

ROCK DRILL.—No. 689,516; F. Rattek, Bridgewater, Mass.



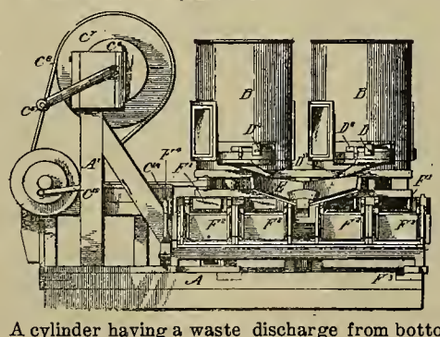
A cylinder provided with an annular valve chamber; a piston slidable in cylinder and forming chambers 13 and 14 at ends; an annular valve slidible in valve chamber and forming chamber 7 at one end which constantly communicates with atmosphere, valve being provided with pressure chamber 3 and exhaust chamber 2, and cylinder being further provided with port 16 and passage 15 which normally connect chamber 13 with chamber 7, and having also port 18 and passage 17 which connect chamber 14 with chamber 3 when chamber 13 is connected with chamber 7, valve operating when reversed to first close port 16 and then place it in communication with pressure chamber 3, and to first close port 18 and then place it in communication with exhaust chamber 2.

NON-ROTATIVE PUMPING ENGINE.—No. 689,775; L. d'Auria, Philadelphia, Pa.



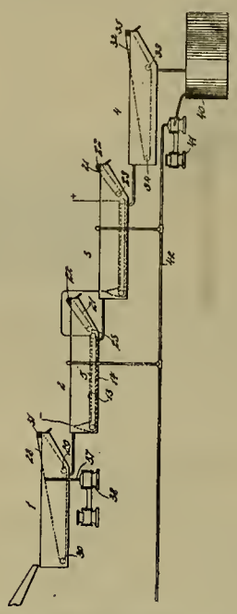
A compensator with flow pipes containing a mass of liquid, flow pipe structures being disposed side by side and constituting foundation or support for cylinder structure of engine, transverse bolts whereby flow pipe structures are connected together, and sleeves or filling pieces interposed between flow pipe structures.

CONCENTRATING AMALGAMATOR.—No. 689,805; A. M. Horton, Saratoga, Wyo.



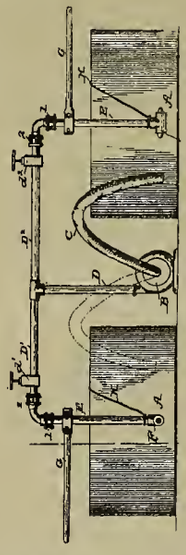
A cylinder having a waste discharge from bottom, a tank beneath cylinder, an inclined testing table communicating with tank, doors to close communicating aperture between tank and table, an independent waste discharge from tank, a pivoted lever for varying inclination of table, an ore discharge from cylinders, a settling tank, a conduit for conveying ore from discharge to settling tank, and a delivery spout at discharge end of conduit.

MACHINE FOR EXTRACTING METAL FROM ORE.—No. 689,674; A. I. Irwin, Cripple Creek, Colo.



A treatment tank, endless anode traveling in tank, upper and lower stretches of anode being in position to be immersed in solution in tank, diagonally-disposed blocks of insulating material attached to anode, cathodes in tank one under each stretch of anode, and connections with a source of electricity.

ORE LEACHING APPARATUS.—No. 689,799; R. L. Graves, Sumpter, Or.



A plurality of tanks, a pump, a discharge pipe leading from pump and having a plurality of branches leading to several tanks and provided each with a discharge pipe which may be turned axially or swung vertically, valves controlling several branches, and a flexible supply or suction pipe leading to pump and arranged to be shifted from tank to tank, levers connected with several discharge pipes whereby they may be turned axially, and means connected with lower ends of discharge pipes whereby they may be swung vertically.

PROCESS OF REDUCING NICKEL SALTS.—No. 689,391; H. A. Frasch, Hamilton, Canada.

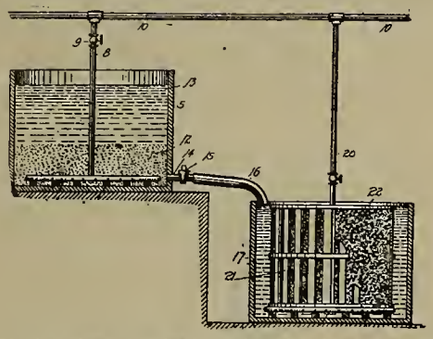
Bringing metals into solution, precipitating hydroxides by addition of a suitable reagent, dissolving hydroxides which are soluable in ammonia in a solution of ammonia and precipitating nickel from solution by addition of a salt capable of displacing nickel.

PROCESS OF PRECIPITATING AND RECOVERING PRECIOUS METALS FROM THEIR SOLUTIONS.—No. 689,190; B. Hunt, San Francisco, Cal.

Adding to pulp a cyanide solution and agitating

same, until metal is extracted; then adding to pulp while continuing agitation, powdered metallic aluminum wherehy precious metal is precipitated, but in suspension in pulp; then adding mercury and continuing agitation until metal is in form of an amalgam, and finally recovering precious metal hy treating amalgam.

PROOESS OF EXTRACTING COPPER FROM ORES.—No. 689,835; G. H. Waterhury, Denver, Colo.



Placing the pulverized ore in a leaching tank with such water and acid as may be necessary, and introducing hot air into tank, drawing off copper solution formed into a tank or receptacle containing pieces of iron small enough to allow solution to pass readily therethrough, and finally introducing hot air into solution.

Latest Rulings Under the Mining Laws.

The following are officially furnished hy the Commissioner of the General Land Office and are the latest in each instance:

Placer—Form of Location.—Within the meaning of Section 2331 of the Revised Statutes all placer mining claims located after May 10, 1872, must "conform as near as practicahle with the United States system of puhlic land surveys and the rectangular suhdivisions of such surveys," whether the locations are upon surveyed or unsurveyed lands. (Miller placer claim, 30 L. D., 225.)

Placer — Non-contiguous Tracts. — There is no authority under the mining laws for the location of a placer claim in two or more non-contiguous tracts, either hy an original or amended location, although the purpose of such location may he to include tracts separated hy intervening surveys or claims. (Otto Schulz et al., Acting Secretary, Septemher 22, 1900.)

Placer—Form of Location.—A placer claim over 16 miles long and ahout 51 feet wide is heyond all bounds of reason, and the entry thereof cannot he sustained. Such was never contemplated hy Congress. (Taylor Park Mining Co., Secretary, Octoher 6, 1900.)

Expenditure.—No part of the value of permanent and immovahle improvements on a mining claim, made long prior to the location thereof hy claimants under a previous location embracing the same ground, solely to improve and develop the prior claim, can he credited to the latter toward meeting the requirement of the statute "that $500 worth of lahor has heen expended or improvement made upon the claim hy himself (the claimant) or grantors." (Yankee lode claim, 30 L. D., 289.)

Practice—Rule 43.—Rule 43 is applicable in all cases of default hy protestant, and is equally applicable in case hoth parties make default. Where protestant makes default it is not in the power of the protestee to prosecute the case within the meaning of said rule 43, neither is it ohligatory upon the register and receiver to hear testimony of contestee's witnesses. If, however, their testimony is received, a decision thereon is not permissihle, hut the case must he dismissed for want of prosecution under the rule. (Charles Ross v. Central Pacific Railroad Co., Acting Commissioner, Octoher 23, 1900.)

Crystalline Deposits.—Crystalline deposits and formations of that character, such as stalactites, stalagmites, geodes, "hox work," "frost work," etc., found in caverns, and which suhstances are valuable solely as mineral curiosities, and disposed of as such, are not minerals within the purview of the mining laws. (South Dakota Mining Co. v. McDonald, 30 L. D., 357.)

Coal Filing—Isolated Tract.—The filing of a Coal D. S. upon an "isolated or disconnected" tract takes it out of the category of such lands, and while the filing remains on record, irrespective of the fact as to whether it has expired hy limitation or not, constitutes such cloud of incumbrance upon the title as to render the land not subject to homestead entry within the meaning and intent of the Act of February 26, 1895, as construed hy the Department in Hand v. De Remer (26 L. D., 676), and that the three years contemplated hy said Act will not commence to run again until such time as the Coal D. S. shall have heen formally canceled. (Montie Blevins, commissioner to register and receiver, Denver, Colo., February 11, 1901.)

Application — Exclusion — Laches. —When claimants elect to make application for patent under Section 2325, Revised Statutes, for part of the claim only, and to proceed, at the same time, as to the remainder of the claim under Section 2326, Revised Statutes, their proceedings upon such application can not he delayed in the Land Department to await the final issue of the proceedings in court. (Little Annie No. 5 lode claim, 30 L. D., 488.)

Mining Applications—Conflicting.—Where an application for patent is filed for land covered by a prior location, the second application is to he treated as excluding the conflict. Under such conditions a judgment ohtained hy third parties against the second applicants for the conflict hetween the two applications is not a judgment under Section 2326 of the Revised Statutes, and hence not of binding force upon the Land Department. (Golconda lode, Acting Secretary, March 30, 1901.)

Mineral Entry — Laches.— The Department will consider laches, notwithstanding the question is not raised hy protest, or, if raised, has been suhsequently waived by protestants. (J. C. Ahby and Thos. Ross v. The Apothecaries Gold Mining Co., Acting Secretary, April 2, 1901.)

Mining Claim—Discovery.—Where it appears that that portion of a mining claim containing the discovery has heen excluded from the application for patent, because of conflict with another claim, the applicants may he allowed to show that a new discovery has been made within the lines of the claim and upon the ground otherwise unappropriated, provided that if such discovery was not made at or prior to the commencement of the period of puhlication of notice it will also he necessary to give a new notice of application as to that claim hy puhlication and posting in the usual manner. (Alice K. and other lodes, Acting Secretary, April 11, 1901.)

Mineral Land—Oil—Classification.—Land can not be classified as mineral (oil) unless it he shown that mineral has been developed thereon. A slight scum of oil found upon the surface of water standing in small holes is not sufficient to constitute a discovery of valuahle mineral within the meaning of the mining laws. The fact that oil has heen developed on lands in the vicinity can have no controlling influence in such a case. (Acting Secretary, June 8, 1901.)

Laches.—Delay of effort to perfect a right to a patent under a judgment ohtained in adverse proceedings in the courts is equally effective as a waiver of such right as is delay in the prosecution to completion of an application for patent. (Fraction lode claim, Secretary, June 29, 1901.)

Location—On Dip of Vein.—A location made upon the dip of a vein or lode having its top or apex within the surface houndaries of a prior location is invalid. (The Shoshone Mining Co. et al. v. The Bunker Hill & Sullivan Mining & Concentrating Co., Commissioner, July 18, 1901.)

Forest Lieu Selection—Act of March 2, 1899 (30 Stat. L., 994).—The Northern Pacific Railroad Co. is not authorized, under Section 3, Act of March 2, 1899, to make selection in lieu of non-mineral lands, in the Pacific Forest Reserve, of lands valuahle for coal or iron, such lands heing mineral lands within the contemplation of the mining laws and suhject only to disposal thereunder. (Ulfers Brown v. N. P. R. R. Co., Secretary, July 16, 1901.)

School Indemnity Selections.—In school indemnity selections the lands in lieu of which indemnity is claimed should he described according to their legal suhdivisions. A description such as "40 acres in Section 16" is altogether uncertain and inadequate. (Samuel Bond et al. vs. State of California, Secretary, July 17, 1901.)

REGULATIONS UNDER UNITED STATES MINING LAWS, APPROVED JULY 26, 1901—IMPORTANT CHANGES.

Placer Claims—Legal Suhdivisions Must he Contiguous.—By Section 2330 authority is given for the subdivision of forty-acre legal suhdivisions into ten-acre lots, which is intended for the greater convenience of miners in segregating their claims hoth from one another and from intervening agricultural lands. It is held, therefore, that under a proper construction of the law these ten-acre lots in mining districts should he considered and dealt with, to all intents and purposes, as legal suhdivisions, and that an applicant having a claim which conforms to one or more of these ten-acre lots, contiguous in case of two or more lots, may make entry thereof, after the usual proceedings, without further survey or plat. (Par. 22, Mining Circular, approved July 26, 1901.)

Placer Claims—Upon Unsurveyed Lands.—The regulations hereinhefore given as to the manner of marking locations on the ground and placing the same on record must he ohserved in the case of placer locations so far as the same are applicahle, the law requiring, however, that all placer mining claims located after May 10, 1872, shall conform as near as practicahle with the United States system of puhlic land surveys and the rectangular suhdivisions of such surveys, whether the locations are upon surveyed or unsurveyed lands. (Par. 30, Mining Circular, approved July 26, 1901.)

Mineral Entry Transfers Suhsequent to Application Not Considered.—No entry will be allowed until the register has satisfied himself hy careful examination that proper proofs have heen filed upon the points indicated in the law and official regulations. Transfers made suhsequent to the filing of the application for patent will not be considered, hut entry will he allowed and patent issued in all cases in the name of the applicant for patent, the title conveyed hy the patent, of course, in each instance inuring to the transferee of such applicant where a transfer has heen made pending the application for patent. (Par. 71, Mining Circular, approved July 26, 1901.)

Conflict in Rule Between the U. S. Supreme Court and Land Department.

TO THE EDITOR:—In last week's "Concentrates" it was stated that "some time ago the Commissioner of the General Land Office ruled that thereafter when mining claims conflicted there could he no compromise between the claimants." This is not in harmony with the decisions of the United States Supreme Court.

In St. Louis Mining Co. vs. Montana Mining Co. (171 U. S., 655), the proposition was that where an application to enter a mining claim is made, and there is embraced therein land claimed hy another, it is the duty of the latter to file an adverse claim and thereafter hring in some court of competent jurisdiction an action to determine the right to the area in conflict, which action must he prosecuted to a final judgment or dismissed; and that no valid settlement can be made by which such adverse claimant can acquire any interest in the ground when thereafter patented hy the applicant.

Upon this suhject the court said that it was not aware of any public policy of the Government which is to he found in the Constitution and the laws, and the course of administrations and decisions, which sustains this proposition.

Where there is a valid location of a mining claim, the area hecomes segregated from the puhlic domain and the property of the locator and his successors in interest. There is no inhihition in the Mineral Lands Act against alienation, and the claimant may sell it, mortgage it, or part with the whole, or any portion of it, as he may see fit, and his contracts for a sale, etc., are legal and will he enforced hy the courts. And that where an application to enter a mining claim embraces land claimed hy another, the latter is under no ohligations to file an adverse claim, but he may make a valid settlement with the applicant hy contract which can he enforced against him after he obtains the patent.

In Lamh vs. Davenport (18 Wall., 314), the court said that the right of the United States to dispose of their own property is undisputed, and to make rules hy which the lands of the Government may he sold or given away is acknowledged; hut subject to these well known principles, parties in possession of the soil might make valid contracts, even concerning the title, predicated upon the hypothesis that they might thereafter lawfully acquire the title, except in cases where Congress has imposed restrictions on such contracts.

The theory of the homestead law is that the homestead shall be for the exclusive henfit of the homesteader. Section 2290 of the Revised Statutes provides that a person applying for the entry of a homestead claim shall make affidavit that, among other things, "such application is made for his exclusive use and henefit, and that his entry is made for the purpose of actual settlement and cultivation, and not either directly or indirectly for the use or henefit of any other person." And Section 2291, which prescrihes the time and manner of final proof, requires that the applicant make affidavit that no part of such land has heen alienated, except as provided in Section 2228, which section provides for alienation for "church, cemetery or school purposes, or for the right of way of railroads." The law contemplates five years' continuous occupation of the homesteader, with no alienation except for the named purposes. It is true that the sections contain no express prohihition of alienation, and no forfeiture in case of alienation; yet, under them the homestead right can not he perfected in case of alienation, or contract for alienation, without perjury hy the homesteader.

In the case of mineral lands there is no statute which in express terms, or hy any fair implication, forbids the making of a contract for the purpose of settling and compromising an action hetween conflicting mineral claimants, and there is no reason in law or equity why such a contract should he held to he illegal or forhidden.

In conclusion, it may he said that the law favors the settlement of disputed matters without recourse to litigation. A. H. RICKETTS.

THE annual report of the Montana mine inspector states that the depth in feet of the shafts of the principal mines at Butte are: Anaconda, 1800; Never Sweat, 2000; Diamond, 2200; Bell, 1700; High Ore, 2200; St. Lawrence, 1800; East Colusa, 900; Leonard, 1200; West Colusa, 1500; Mountain View, 1800; Silver Bow No. 1, 1000; Silver Bow No. 2, 2700; East Gray Rock, 1600; Blue Jay, 1075; Original, 1300; Colusa-Parrot, 1400; Stewart, 1150; Rarus, 1300; Minnie Healy, 900; Gagnon, 1800; Parrot, 1500; Speculator, 1400; Moonlight, 1300.

IT is said that the total area of the gold fields of Western Australia is over 324,000 square miles, or just one-third of the area of the colony itself.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

On the Yellow Jacket mine, at Wyndham bay, J A. Mays, Supt., is arranging for the erection of buildings for at least two 10-stamp mills, and it is reported will probably order buildings for twenty additional stamps and concentrators. The mine upon which the company will put these mills has been bought from Mays & Barclay for $10,000, and consists of the Gray Eagle group of free gold claims, mill site and water rights. The vein upon the claims is said to be over 16 feet wide, a contact between slate and schist, carrying values in free gold, running from $10 upward. The Yellow Jacket is a Seattle, Wash., corporation, T. H. Ellis, president, and C. Moulton, secretary.

KETCHIKAN.

The Ketchikan G. M. Co., at Sea Level, is opening its mine by a tunnel half a mile inland from the harbor and 400 feet above the sea level. There is a 5-foot ledge of free-milling ore which runs $9 to the ton and development work will continue during the winter preparatory to putting in a mill.

Mellen & Reynolds, at Coppermount, on Prince of Wales island, have made the fifth shipment of 200 tons of ore to the smelter. It runs 30% copper. Development work is to continue. Prospects are for monthly shipments of 200 tons.

ARIZONA.

COCHISE COUNTY.

At the Tombstone Mines Co.'s combination shaft levels are being run, during the course of which ore bodies are met, but no stoping is being done, this work being development. At the company machine shops the old machinery is being overhauled and prepared for use.

About six months ago J. J. Pearce bought from L. D. Redfield a gold claim near Benson upon which a shaft was down about 60 feet. Mr. Pearce has now sunk the shaft to a depth of 125 feet, and has opened a body of free-milling gold ore for the reduction of which it is reported he will shortly erect a mill.

GILA COUNTY.

Supt. W. S. Sultan of the Arizona Commercial Co. has received instructions to resume sinking on the Copper Hill mine at Globe. The shaft is now down 415 feet and will be sunk 200 feet deeper.

C. W. Slack, assayer for the Pinal Copper Co., states that owing to the decline in the price of copper, ore shipments from the Black copper mine at Globe to El Paso have been discontinued and ore sorters have been laid off. Development work, he states, will be continued, however, as heretofore—sinking the double compartment shaft, which is down nearly 300 feet and opening the 200-foot level.

Supt. Whipple of the Globe-Boston C. Co. states that the sinking of the double-compartment shaft on the I X L claim at Globe will be resumed, and as soon as the pump is installed the company is prepared to carry on development work regardless of the price of copper.

D. Gibson of the Columbia C. Co., near Globe, states that the double-compartment shaft is down 310 feet and continues in high-grade chalcopyrite ore.

T. Crandall, Supt. of the Del Shay gold mine at Tonto, says recent development work has opened the ore body at a considerable depth. The Del Shay property is under bond to St. Joe, Missouri, people, most of whom are officers and stockholders in the Pinto Creek M. & S. Co.

GRAHAM COUNTY.

At the Copper Belle M. Co., G. M. Ruff manager, 18 miles from San Carlos, work is being done on the tunnel and in the shafts. The tunnel is being run to cut the vein down 400 feet from its apex. The ore is copper sulphide. The company says it will put up a smelter as soon as the tunnel has opened up the vein.

MARICOPA COUNTY.

Goldberg Bros. of Phœnix are placer mining near Wickenburg with ten men employed. So far all the gold has been found on the surface, the formation being an immense white quartz blowout, but Goldberg Bros. are having a shaft sunk.

MOHAVE COUNTY.

At the Planet copper mines two gasoline hoists have been installed and a two-compartment shaft will be sunk 500 feet.

The Maguire gold mines, near Kingman, it is reported, are to be opened up by a tunnel started on the west end of the claims.

PIMA COUNTY.

The San Xavier mines, near Tucson, operated by the American Zinc Co., Supt. Forbes, have been extensively developed. More than 4000 feet of openings have been made, including the main shaft 550 feet deep. More than 150,000 tons of ore is claimed to be blocked out. The ledge at the lowest workings is said to be over 45 feet wide, containing lead, copper, silver and gold. There are three hoists on the mine and 10,000 tons of ore on the dumps.

SANTA CRUZ COUNTY.

The Jefferson group of mines in the Patagonias, near Patagonia, consisting of the Lead Queen, Grizzly, Wedge, Rosina and Help Me, have been sold to Eastern people, represented by A. C. Coffey, who had a bond on them and has been doing development work for the past six months.

YAVAPAI COUNTY.

A strike has been made at the Home Run mine on Groom creek near Prescott. This mine was bonded by D. Moynahan and associates of Niles, O., about a year ago and has been under development since. Lately in both drifts on the lower level large bodies of high-grade gold and silver ore have been encountered.

On the Victor mine at Groom Creek, near Prescott, G. Woods is grading for the erection of a stamp mill.

YUMA COUNTY.

(Special Correspondence).—The King of Arizona, 40 miles north of Mohawk Summit station, employs about 100 men in the mine and mill. The property is opened through a crosscut tunnel to the vein, on which there is approximately 3000 feet of drifting. There is also a 200-foot shaft near the tunnel entrance, from which there are two levels. There is also a large amount of open-cut work from which ore has been taken. The vein is regular, of quite uniform width, with walls well defined. It is believed to average 20 feet wide. The ores comprise a quartz stained with iron and manganese, carrying visible free gold.

The mill is equipped with crusher, rolls and screens for dry crushing, the necessary lime being added during the crushing process. The pulp, reduced to sixteen and twenty mesh, is conveyed to the cyanide leaching vats, of which there are seven of 250 tons capacity each.

The crushing capacity of the mill is about 125 tons in twenty-four hours. The property has been working about three years. The water supply is pumped from a 1100-foot bored well 5 miles away, being raised 1450 feet to the tanks above the mill.

Kofa, Ariz., Dec. 31.

CALIFORNIA.

AMADOR COUNTY.

People interested in the Anita and Kennedy mines are negotiating to buy the Good Hope mine, at Jackson. The Anita company, having explored the ground west of the Good Hope and not finding the Kennedy ledge, the latter, it is now believed, must be in the Good Hope ground, and, if the mine is sold, it will be explored by a deep shaft to determine whether or not it contains the Kennedy ledge.

In the Argonaut, at Jackson, sinking operations are being pushed steadily. Ten stamps of the mill are kept running on half time on ore from the Hoffman ground. The point where the ore is being extracted is about 2000 feet from the Argonaut shaft, and work is much hampered by distance and lack of ventilation. It is understood, however, that the ore body has improved in size and quality and indicates that a paying mine has been discovered within the limits of the Hoffman ranch, owned by W. F. Detert, but under option to the Argonaut Co.

The shaft at the Zeila mine is undergoing repairs, and Supt. Detert says that it will take until February before they are completed. During the repair work about half the usual working force is laid off.

At the east shaft of the Kennedy mine, at Jackson, a little over 2700 feet in depth has been attained and preparations are under way for drifting to the ledge from the 2400 and 2550-foot levels.

CALAVERAS COUNTY.

J. J. McSorley has given Eastern people a sixty-day cash option to buy the Hexter placer mine at Mokelumne Hill. They are putting in an air compressor to work on the mine at once. This claim covers one of the old gravel channels. About 1200 feet of it was worked by early-day miners. The other end, about a mile distant, was also very rich, but the middle portion, on account of the great quantity of water, could not be worked advantageously. The Hexter tunnel is projected to drain this ground.

The Iowa Con. mine, at Rich Gulch, owned by Iowa and New York people, is being opened by a 400-foot tunnel, which will tap the vein 200 feet deep. The tunnel is now in 127 feet in very hard quartzite. A. Laidet is foreman.

The Wright & Lane mine will soon start its 40-stamp mill, using electric power from Knight's Ferry, a distance of about 8 miles. The hoist will be run by compressed air and the compressor by electricity. Direct water power will be used for the rock breaker, the water being conveyed through a pipe from the company's dam on Littlejohn creek, and the same water will be afterwards utilized for the stamp batteries.

The Sultana mine at Angels Camp is being worked. The Bovee shaft is unwatered and retimbered to the 250-foot level and the 20-foot sump cleaned out. The Fritz shaft is down 120 feet, with an 8-foot ledge of good rock. The mill is also being overhauled. An air compressor and a new hoist will be put on the Fritz shaft.

EL DORADO COUNTY.

It is said that the Pacific mine, at Placerville, will resume operations shortly. The principal owners live in England. Foreman Evans expects to put men at work soon.

MARIPOSA COUNTY.

The Garibaldi mine at Kinsley is handling daily 3600 tons of water, from 60 to 70 tons of waste and 40 tons of ore. The five stamps of the mill were recently started. More stamps will be added soon. The ore is taken from two parallel veins about 10 feet apart. The shaft is down 355 feet and will be sunk deeper as soon as the ore from the upper levels is stoped out.

It is reported work will soon be resumed at Mt. Gains and the old Martin mine at Quartzburg. The 10-stamp mill at Elkhorn is running.

In the Mariposa mine, at Mariposa, on the second level, a crosscut in the footwall 400 feet from the shaft has struck a 3-foot vein of good ore which has been followed 60 feet. The station at the 1000-foot level is completed and drifts have been run 100 feet both ways. The vein is from 2 to 5 feet, the value of the rock being fully as good as in the upper levels. The shaft is down 70 feet below this station. The west drift at the 500 level is in 400 feet and follows a 3-foot vein. Stoping is being done east and west at 500 level and west at 600 and 800 levels.

MONO COUNTY.

Philadelphia people have taken an option on a part interest in the group of claims, near Benton, owned by S. G. Lines and J. B. Cowrie, and are having prospecting work done on them. The ores carry gold, silver and copper.

NEVADA COUNTY.

The Ironclad M. Co. has bought the 100-acre ranch of Mrs. J. Miller at Rough & Ready, for $2250, Supt. Hay acting for the company.

D. Voss, who recently leased the Welch mine in Willow valley, near Nevada City, is having the old shaft retimbered. It will be pumped out and sunk deeper.

The pump at the Grass Valley Con. has been started up and is clearing the mine of water, which Supt. Coffin expects to have accomplished in about two weeks. As soon as the mine is dry, the work of sinking will be commenced. The pump and an electric hoist for the mine will be run by electricity.

The owners of the California mine at Nevada City have decided to install electric power at the mine. The hoisting at present is done by steam power; G. Levensky manager.

A slide of rock and earth occurred at the Champion mine at Maybert, which is owned by Dr. Tickell of Nevada City and others, and has crushed in the rear of the mill building and struck the concentrators, doing considerable damage.

A new rock breaker has been put in at the Grizzly Hill drift gravel mine, near Nevada City, to break the big pieces of cement gravel, which is very hard. After it is reduced in size it will pass into the machine which was recently taken to the mine to work the gravel. At present men are engaged in opening up some ground from which gravel will be extracted.

PLUMAS COUNTY.

W. Malcom states that at the Crown Point mine, near Quincy, the building for the quartz mill is completed and the machinery is being installed. Lesher & Gobert are the owners.

SAN DIEGO COUNTY.

(Special Correspondence).—The American Girl mine, 4 miles northeast from Ogilby, is worked through a 600-foot incline, which cuts under the ore body, levels from the incline being run to the ore in different directions. The ores are an iron and copper sulphide, carrying high values in gold. A mill on the mine is equipped for dry crushing, concentration and cyanide work. It has eight standard tables, which make a heavy, clean concentrate. The tailings, carrying the silica and slimes, are cyanided, there being six 100-ton leaching tanks and two of fifty tons each. Thos. Johnson is mine Supt.. J. E. Healey in charge of the cyanide work and Oscar Otterson the concentrators. About 100 tons of ore and waste daily are being hoisted. The supply of water is pumped from the Colorado river. Oil burners are being put under the steam boilers. It is expected they will ship 100 tons of concentrates per month.

Ogilby, Dec. 24.

SACRAMENTO COUNTY.

The Asbburton Dredging Co., operating between Fair Oaks and Folsom, it is said is realizing nearly $1300 daily with its machine. Hanford Bros., in the same district, have one dredge in operation and have placed an order for two more. The Zelma Bell G. M. & Dredging Co. owns 140 acres of gold-bearing gravel on the North Fork of the American river, which pays from $1.73 to $5 per yard on the bedrock. They have let a contract for a dredger and will begin operations early next month.

SHASTA COUNTY.

There is a fire in the ore body of the Iron Mountain mine, near Redding, and the property is closed. The management announces that the closing is temporary, to allow the workmen a rest during the holidays, and that the fire is not serious, the intention being that full operations will be resumed after January 1st.

The Sunny Hill mine, near Ono, is said to be taking out good quartz. Smith & Doll have sold out the water right and all their claims to the Marina Marsicano G. M. Co. of San Francisco.

The Bully Choop mine has closed down until spring.

SISKIYOU COUNTY.

F. Alger and J. L. Barry of Callahans, owners of the Hornet and Wasp mines, near Gazelle, have run a tunnel 180 feet, opening a 5-foot ledge of promising quartz.

At the Bumble Bee mine, near Callahans, F. Alger, the owner, says the ore assays $12 gold, fourteen ounces silver and 10% copper.

The King Solomon mine, near Cecilville, is running with about twenty-five men under J. A. Thompson, manager. The mine is to be run all winter.

Thirty men are employed at the Summerville hydraulic mine under the management of Belfrey & Long. They are making preparations for a long run when the water supply is on The company has bonded Hillyer & Tuttle's placer mine adjoining at $15,000.

The Van Brunt M. Co. at Happy Camp district are working their hydraulic mine with two No. 5 giants. Water is brought through their 18-mile ditch out of the south fork of Indian creek. They have recently installed a 45-light electric plant, and during the summer run 500 feet of tunnel to drain a large area of ground that would require too deep a cut to bedrock to be safe. The company are now using steel rails for riffles, having hauled from the railroad at Montague 75,000 pounds.

The hydraulic mine at Portuguese creek, at Seiad, owned by Wood & Cuddihy of Happy Camp, is being operated this season under the supervision of D. Cuddihy.

The old John Brown mine at Cottage Grove, which was bought by Reno, Nev., people, is being prepared for the winter run. F. M. Drumm is Supt.

J. T. White, formerly Supt. of the Minetta B. mine at Nolton, and J. W. Martin have leased the Minetta B. and are now working the mine with a head of water from Thompson creek.

Supt. A. C. Brokaw of the Quartz Valley hydraulic mine, near Oro Fino, is installing a large hydraulic elevator. Four giants are in active operation at the mine with an abundance of water in the ditches. The claim is fitted up with an acetylene gas plant for work during the nights. Mr. Brokaw has also fitted up a quartz mill at Hull gulch, which crushes quartz from a ledge lately discovered at the lower end of the hydraulic claim.

TRINITY COUNTY.

(Special Correspondence).—At the Dorleska, at Abrams, the new 3½-foot Huntington mill commenced work Dec. 8th, replacing the small prospecting mill, which had been working since June 3d. The latter, with a capacity of but a little more than a ton per day, has reduced 184 tons, and turned out fifteen bars of bullion, from which the U. S. Mint has returned $32,191.47. Of this, forty-six tons, classed as "bonanza" ore, yielded $25,376 87, or $551.67 per ton. The remaining 138 tons of second-class ore gave $6814 60, or $49.38 per ton. This was entirely of free gold, amalgamated in the battery and on the plate. In addition there are about 2% of concentrates, those from the richest ore being of high-grade, saved by a Woodbury concentrator. The new mill starts with about 600 tons of second-grade ore on the dump, all of which, together with that which has been reduced, having been taken out in the development work. During the past season about 1000 feet of tunnel and drifts have been run, and 180 feet

of shaft and winze sunk. Wagon roads and trails have been made, and a sawmill, shaft house, bunk house, barn, store and other buildings have been constructed, and several hundred acres of timber lands purchased adjoining the mines. During the winter about fifteen men will be employed in sinking the shaft and running a third level, and in addition a long tunnel is being run on contract. Union Consolidated Gold Mines Co., of Los Angeles, owners; H. Z. Osborne, president and general manager; M. H. McIlwaine, superintendent.

The Trinity County G. M. Co. of New York City has been incorporated, capital $1,000,000, to work Trinity county gold mines; G. Cox, Jr., T. O. Callendar, F. J. Kilnea and G. Wilcox of New York City, P. J. Bradley of Boston, Mass., and J. Hinchcliffe of Patterson, N. J., are the directors.

TUOLUMNE COUNTY.

At the Vine Spring mine, near Columbia, the pay shoot struck in the upper tunnel has been found in the lower tunnel, showing 18 inches of high-grade ore. The erection of a mill on the property is being talked of.

J. Schoenfeld and D. Adler have sold to L. Radovich and W. Smith of San Francisco the Possible mine, situated near Columbia.

W. B. Buckminister, E. H. Mason, C. C. Jackson and W. C. Forbes, all of Boston, Mass., have deeded the Erin Go Braugh and Cloudman quartz mines to the Harvard G. M. Co. for $350,000, paid by 70,000 shares of stock.

The 5-stamp mill on the Wild Cat mine, near Soulsbyville, has started up. C. G. Grimm is Supt. He has twelve men at work sinking the shaft and clearing out the old workings.

The Century G. M. Co. of Pittsburg, Pa., operating at Tuttletown, capital $200,000, has been incorporated by A. M. Schoyer, S. C. Scott, L. B. Taylor, G. M. Merritt and J. Lee, all of Pittsburg, Pa.

In the Von Tromp mine, steam power is to be used by Stanford and associates in the proposed mining operations to strike the Table Mt. channel. A 60 H. P. engine will be used for the hoist. The work of sinking the shaft has been commenced.

YUBA COUNTY.

Arrangements have been made by which several old mining claims at Brown's Valley will be extensively developed. The deal includes the Dannenherg, Pennsylvania, Jefferson and the land owned by T. J. Hibbert. It is understood that all of these owners have bonded to sell for eighteen months. The conditions of the bond require the expenditure of at least $50,000 in development work. The Pennsylvania and Jefferson have been rich mines, but the lode or veins worked were found broken, and at times disappearing in the drifts. A mill on one of the claims is being kept at work most of the time on ore from the old openings. Manager L. Scrutton is arranging for putting more men at work in the near future.

COLORADO.

BOULDER COUNTY.

Boulder county production for 1901 is as follows:

Gold production	$790,700
Silver production	128,920
Other metals	109,280
Total production	$928,900

The contractors on the Cornucopia tunnel, at Ward, have finished their contract and the tunnel is now in 350 feet. A contact vein has been cut which is 8 feet wide. The pay streak is 3½ feet wide.

CHAFFEE COUNTY.

The Buena Vista S. & R. Co.'s plant at Buena Vista was destroyed by fire on the 21st ult., the loss being about $75,000. It contained one pyritic furnace, with a capacity of 150 tons daily, and had been operated continuously since it was constructed in 1889. It was an independent concern and was under the management of B. F. Morley. The plant will be rebuilt and will have its capacity trebled.

The production of Chaffee county for 1901 is estimated at $382,439.22 in gold, silver, copper and lead. Of this the Cache creek placers at Granite produced $30,662 in gold, the Mary Murphy, at Ramley, $6116 in gold. Gold washed from the Arkansas river, $600. The smelter produced about $48,533 in gold.

CLEAR CREEK COUNTY.

The Mint property, at Empire, has been taken over by the Metallic Extraction Co., which will develop the group and install a mill for handling economically the low and medium-grade output. Numerous mill returns show grades of ore from $60 for the smelting down to $8 for the crude concentrating product. The old Knickerhocker mill site at Empire, with its water power, has been leased by the company.

The Newhouse tunnel from Idaho Springs is progressing toward the California mine, on Quartz hill, having reached a length of nearly 1500 feet, and is being driven at a rate of nearly 300 feet per month. The beading is now beyond the Kokomo mine, in Gilpin county. It is expected that the Saratoga mine, at Russell gulch, will be cut during 1902, and the manager will sink the shaft on that mine so as to make a connection with the tunnel for ventilation and drainage.

Idaho Springs during 1901 shipped 1422 cars carrying 28,440 tons of ore, containing values amounting to $1,564,200, which represents a gain of 35% over the output of 1900. The number of miners employed is estimated at 1600; average wage per day, $3; monthly payroll for the district, $35,000, and the total paid miners during the year, $420,000. The district has three sampling mills, having a capacity of 230 tons per day, and eighteen concentrators, equal to handling 850 tons a day.

The East Argentine T., M., M., P. & T. Co. has been organized at East Argentine; M. Wheeler is president, R. A. Leisy secretary and treasurer and M. Sidney manager. The properties of this company consist of 100 acres of mineral lands at East Argentine, upon which some development work has been done. The projected tunnel is to open up the mining claims of the company and will cut the veins about 1000 feet lower than any of the other projected tunnels in the district.

GILPIN COUNTY.

The shipments during 1901 from Black Hawk of smelting ore and tailings to the smelters, and mill or concentrating ore to the concentrators, show a gain over 1900 of about 11,000 tons. In 1900 the total shipments were 58,689 tons, to which was added 10,000 tons which was hauled to Idaho Springs by wagon from Russell Gulch. In 1901 the railroad shipments were 69,348 tons, to which is added 11,000 tons sent to Idaho Springs by wagon, making a total of 80,348 tons.

The shipment of gold from Black Hawk banks to the Denver Mint for 1901 aggregate $510,000. Considerable gold is taken to the mint and refining establishments by individuals of which there is no record.

Taking the bank shipments of gold and the value of the ore shipped, the yield of Gilpin county for 1901 was as follows:

80,348 tons of mineral	$3,440,000
Bank shipments	510,000
Total	$3,950,000

GUNNISON COUNTY.

The old Eureka-Nest Egg, at White Pine, which, it is said, has yielded $1,500,000, after a long shut down is now, under Manager D. C. Tobin of Leadville, making a monthly output of 400 tons of carbonates and sulphides.

The Kentucky Gulch M. Co., which has been operating at Tin Cup this year, reports a discovery of a body of fluorspar ore 12 feet wide—a marketable product at the smelters.

The Forest Hill M. Co., at Tin Cup, has its new mill ready to operate on its low-grade ores. Besides several thousand tons of ore already mined, there is said to be blocked out in the workings several times as much.

HINSDALE COUNTY.

Supt. P. Newman of the Sherman G. M. Co., at Lake City, states that a small streak of bismuth ore has been encountered in the mine, which assay returns show to run about $400 to the ton.

LAKE COUNTY.

The Colorado-Manhattan G. M. & L. Co. has been organized by C. W. Lininger, S. G. Kahn, M. Kahn, A. Milks and W. Keenholts of Leadville, with $600,000 capital. The company has a five-year lease on eighteen acres of ground at Leadville in which a diamond drill hole 500 feet deep disclosed high-grade sulphides.

Leadville produced a total for the year of about 750,000 tons of ore, with a total valuation of $15,000,000.

MESA COUNTY.

J. V. Howard of Grand Junction says he has an offer to build a pyritic reduction furnace of 100 or 200 tons daily capacity at Grand Junction. The preliminary steps have already been taken to organize the company and work on the plant is expected to commence soon.

MINERAL COUNTY.

The United Mines Co. of Creede recently declared its first dividend of $12,500. It is understood that the showing in the mine is good.

OURAY COUNTY.

The Camp Bird Extension Co. has bought from G. L. Wright the Hoosier Girl and Richmond claims in the Imogene basin, at Ouray, and also a millsite.

Ore shipped from Ouray during the year 1901 was 1564 cars, a decrease of 355 cars under the preceding year. The values, however, of this year's shipments largely exceeded those of 1900, owing to the fact that a large proportion of the cars contained concentrates from the mills. The output of the county for the year 1900 was, in round numbers: Gold, $2,131,000; silver, $1,807,541; lead, $433,548; copper, $71,901; which was increased in 1901 to gold, $2,138,000; silver, $1,800,000; lead, $430,000; copper, $71,000.

PITKIN COUNTY.

The output in tonnage for 1901 of Pitkin county is about 110,000 tons. Of this about 71,500 is milling and 35,500 smelting ore. The average value per ton in silver is close to fifty ounces and 4½% lead, as follows:

88,000 tons low-grade ore at $6.50	$572,000
2,000 tons high-grade ore at $20	40,000
20,000 tons concentrates at $30	500,000
110,000 tons ore output, value	$1,212,000

The average number of men employed for the year just past by both companies and leasers is about 1500. The payroll for the month will approximate $135,000.

SAN JUAN COUNTY.

San Juan county's output in the four principal metals in 1901 is as follows:

Gold	$1,500,000
Silver	1,450,000
Lead	825,000
Copper	250,000
Total	$4,025,000

SAN MIGUEL COUNTY.

The output of San Miguel county for 1901, by mines, is as follows:

Smuggler-Union	$ 833,900
Tom Boy	819,800
Liberty Bell	612,500
Carribeau Montezuma	156,000
Butterfly-Terrible	125,400
Ophir Consolidated	70,600
Alta Mines Co	45,600
Milwaukee Ophir	40,000
San Bernardino	57,000
Gold King	55,000
Peck Cyanide	55,000
Miscellaneous shipments	127,000
Total	$2,997,400

Shipments of crude ore and concentrates from railroad stations in San Miguel county, by carloads, have been as follows:

	Cars.
From Telluride station	1,546
From Ophir station	542
From Placerville station	51

SUMMIT COUNTY.

The Howard M. & M. Co. has been incorporated in Maine, capital $100,000, to operate a group of free-milling gold lodes near Breckenridge. A. C. Howard of Breckenridge is president and manager and J. F. Derwin, Jr., secretary and treasurer.

The Royal Mountain lode and Royal placer claims at Breckenridge have been sold to the King Solomon T. & M. Co., composed of Pueblo and Colorado Springs people. The company is preparing to complete the tunnel and is building a tunnel house.

TELLER COUNTY.

The owners of the Sand Burr mine, near Cripple Creek, are proposing to build a mill to treat their ores. They claim to have a mountain of low-grade rock which can be mined and sent to the mill for about $1 to $1.50 per ton. Recently they have had cyanide treatment tests made satisfactorily. There is water power available to run the proposed mill, and it is estimated that $4 ore will return a profit of $1 per ton to the company.

E. A. Stevens, who is operating on the Golden Wedge claim of the Mary Jane Co., at Cripple Creek, has decided to order a new hoist to sink 1000 feet. It is his intention to sink to the 500-foot point, cutting stations every 100 feet.

The annual report of the Doctor-Jack Pot Con. M. Co., at Victor, shows that during the nine months terminating October 31 the mine shipped $645,998.83 worth of ore and the lessees $52,259, making a total of $698,258 36. The principal disbursements of the year were: Dividends, $232,000; operations, $228,720.70; transportation, $108,110.94; transportation and treatment of lease ore, $15,523 39; general mine office expense, $14,524.39. The report further shows that the company has $35,309.76 in cash. F. M. Woods is manager.

The lessees operating the Echo Co.'s property at Cripple Creek have decided to install a steam plant of machinery, which will include boilers and a hoist, to sink 500 feet. A compressor may also be included in the improvements.

The Cripple Creek & Colorado M. Co., operating at Cripple Creek, has let the contract for a large plant of machinery for the A shaft, which the company intend putting down to a depth of 1000 feet immediately. The hoist will be good for the depth of 2000 feet.

A partial list of the ore production and gross value made by the mines operating in the Cripple Creek district, as furnished by the companies for the year ending 1901 is as follows:

	Tons.	Value.
Portland	95,000	$3,535,000
Stratton's Independence	78,000	2,600,000
Elkton	20,000	1,200,000
Strong	28,000	980,000
Mary McKinney	24,000	960,000
Vindicator	17,000	725,000
Ajax	20,000	700,000
Golden Cycle	23,000	690,000
E. Paso Con	6,000	500,000
Gold King	14,000	496,000
Anaconda	8,900	340,000
Stratton's C. C. & M. D. Co	7,000	280,000
Free Coinage	5,000	250,000
Modoc	3,500	245,000
Isabella	6,000	210,090
Christmas	6,000	210,000
Joe Dandy	4,000	200,000
Independence Con	6,200	186,000
Midget	3,600	180,000
Acacia	3,500	175,000
Anchoria-Leland	3,380	168,962
Victor	4,500	135,000
Findley	2,500	100,000
Pointer	1,750	89,827
Lillie	1,875	75,000
Gold Coin		1,000,000
Consolidated Mines		750,000
Doctor-Jack Pot		700,000
Gold Dollar Con		190,000
New Zealand Con		100,000
Damon		65,000
Battle Mt. and Misc		15,000

The following report has been made by the various reduction works and samplers handling Cripple Creek ores during 1901:

	Tons.	Value.
Colo. & Standard, Colorado City	204,935	$5,794,200
Metallic Nat. & Union, Florence	80,000	1,904,000
Economic, Cripple Cr'k	40,000	1,225,000
Dorcas, Florence	21,310	538,020
El Paso, Florence	3,500	87,500
Metallic, Florence	80,500	1,637,500
Union, Florence	29,950	548,250
National, Florence	2,000	76,000
Totals	409,195	$11,311,070

The samplers handled ore as follows:

	Tons.	Value.
Cripple Creek O. S. Co.	125,000	$5,000,000
Taylor & Burton	60,000	2,700,000
Rio Grande S. Co	90,000	4,236,873
Eagle	54,000	2,084,669
Totals	329,000	$14,021,542

IDAHO.

BOISE COUNTY.

The old Lincoln mine at Pearl has been bought by C. D. Kennedy and J. T. Hodson for $50,000. This mine has already made a record as a producer.

The Payette G. M. & M. Co. has been incorporated at Salt Lake City, Utah, capital $50,000. E. D. Woodruff is president and C. E. Hudson secretary and treasurer. The company owns the North Star, Buena Vista, Belle View and Bell Air claims in the West View district.

IDAHO COUNTY.

The Hidden Treasure and Rainbow groups at Thunder Mountain, each embracing three claims, have been sold by the locators to the Belle of Thunder Mountain M. Co., capital $1,000,000.

C. A. Jones, the discoverer of the Onyx mines near Orofino, has sold them to a Moline, Ill., company, and Mr. Jones says that several of the heavier stockholders of the company expect to visit the property the first of the year, when the work of development will be commenced.

The Gold Creek M. Co.'s claims on Snake river, 30 miles from Oro Fino, comprise 4 miles of Gold and Snake creek locations; 3 miles of flume, 4x5 feet in size, has been built, and a long stretch of 22-inch pipe installed. Operations with this company will start with the opening of spring.

SHOSHONE COUNTY.

L. O'Neill of Murray says of mining development in the vicinity of Murray that B. N. Hillard, manager of the Cœur d'Alene M. Co., owning placer grounds in Murray, is taking in his machinery over the snow. The Golden Chest, a quartz property, is working forty men and taking out gold.

MONTANA.

BEAVERHEAD COUNTY.

The first returns from ore shipped from the Ajax mine, in the Big Hole basin—a carload—netted $886.60. The ore carries galena and gold. This mine is owned by J. E. Morse and A. J. Noyes, and it is said that it is growing richer and wider as development progresses. The ore is freighted nearly 80 miles in order to get it to the shipping point at Divide.

The Hecla mines during 1901 shipped several hundred carloads of ore, which

camo from the Cleve and other properties. The group owned hy the Hecla Con. M. & M. Co. has yielded since discovery over $16,000,000 in ore values and paid nearly $3,000,000 dividends. The mines are still producing. H. Knippenberg is president and G. B. Conway is manager.

CHOTEAU COUNTY.

The Mission Peak Co., Putnam & Zortman and Finch & Campbell of Spokane, Wash., are doing a great deal of development work at Landusky. Finch & Campbell have honded the August and Little Ben mines from the Thomas O'Hanlon Co. of Chinook, and, it is reported, expect to take it up. They are also doing development on the Hawkeye, owned by A. D. Gill and W. Blackwell.

FLATHEAD COUNTY.

H. Hildebrandt has returned from Spokane, Wash., whore he went with orders for the purpose of forming a company to operate some of his mining property. The Mustang Con. M. Co., capital $300,000, has been incorporated at Spokane, Wash. A. A. Miller, A. D. Miller, G. F. Shawler of Spokane, Wash, and H. Hildebrandt of Libby are the officers and directors of the company, which owns the Mustang, Gold Pan, Gold Plate and Blue Jay claims in the West Fisher district. The development consists of a 60-foot tunnel, showing a vein 4 feet wide with a 10-inch pay streak. It is the intention to continue this tunnel and also commence another one lower down. The values are free milling.

GALLATIN COUNTY.

The Eriega Copper & Coal M. & S. Co. has been incorporated in Bozeman, capital $5,000,000, to operate in Madison and Gallatin counties. J. F. Firsch, C. L. Anceney, J. A. Fennell, A. Lewinski, S. H. Swetland, all of Bozeman, are among the stockholders.

JEFFERSON COUNTY.

The new mill erected hy J. H. Longmaid at the Elkhorn mine at Elkhorn, which, it is said, has cost upwards of $125,000, is now treating the ore from the dumps. In the meantime the hoilers and pumps have been installed and the work of unwatering the mine commenced. Upwards of 100 men are employed.

LEWIS AND CLARKE COUNTY.

Gold ore assaying very high has been discovered in the northern portion of this county. Numerous assays of ore from the discovery claim show from two to three ounces in gold and from 200 to 300 ounces in silver to the ton. The claim is located in the high mountains, and at this time of year is inaccessible.

MADISON COUNTY.

A. G. McDonald has taken a ten years' lease and bond on the Columbus group of four claims on Richmond Flat. It is estimated that development work in the last six months has exposed to sight several hundred thousands of dollars in ore values. Mr. McDonald is associated with Eastern people who will build a mill on the property next spring.

H. Ptomy has struck a body of $100 ore in the Lucas Flat at Summit.

J. H. Levy, who has been working the High Bluff mine at Meadow creek, shut down last week for the winter. He has been doing development work on a veln of high-grade ore from 4 to 18 inches wide.

C. L. Dahler of Iron Rod says he has succeeded in profitahly working over the tailings of the Iron Rod quartz mill by the cyanide process. He states that there is considerahle actlvity in mining at Iron Rod and that leasers on some of the mines are doing well.

The hond on the Comet mine, near Sheridan, has heen taken up by the Wall Street M. Co. through W. H. Godfrey of Great Falls. The property was formerly owned hy D. Keneally, P. Balsom and T. Reardon.

PARK COUNTY.

The Golden Gulch M. Co. has been incorporated at Livingston, capital $100,000. The president is C. F. Stickney of Philadelphia, Pa., and the manager W. Carr of Livingston. The company will operate placer claims in the Six Mile district.

SILVER BOW COUNTY.

J. Cummings, who is working the Edlth May, at Butte, under a lease and hond, says he has struck a body of ore about 15 feet from the surface that will assay 20% copper and a falr value in silver. The mine is owned hy G. H. Casey, P. J. Brophy and others of Butte.

Close estimates of the value of the hase and precious metals produced hy the Butte mines in 1901 aggregate $48,160,000. The output of some of the companies in pounds of copper is: Anaconda and Parrot companies, 125,000,000; Boston & Montana, ten months, 55,000,000; Montana Ore Purchasing Co., 25,000,000; W. A. Clark Co., 20,000,000; Butte & Boston, 14,000,000; Colorado Co., 12,000,000. The gold and silver product is valued at about three millions.

NEVADA.

ESMERALDA COUNTY.

The Willard & McDonald mine, near Holbrook, has been honded to S. G. Lines, who has men at work cleaning out the old shafts and tunnels and preparing for a search for the lost lead, which paid largely years since. O. C. Sawyer is Supt.

HUMBOLDT COUNTY.

The Sheha G. & S. M. Co., of Salt Lake City, have decided to start development work on the thirteen claims owned hy the company in Star district. Among the claims owned is the Old Sheba mine, from which $4,000,000 worth of ore has been taken. It was worked down to the water level and then abandoned.

LANDER COUNTY.

J. Johnston, W. M. Bradley and V. H. Pease have sold the Iron mine's group of claims, near Battle mountain, to ex-Senator Pettigrew, A. E. Hyde and J. W. Fox, Jr., of Salt Lake City, for $75,000, the first payment being $20,000. Fifteen men are now employed, and four of them working on ore are reported to have taken out over 400 tons of $40 free-milling rock since the 7th of December. It is the intention of the huyers to equlp the property with a mill as soon as possible. One chute of ore has been developed hy winzes 90 feet apart—one to a depth of 75 feet and the other 50, and the entire mass of 16 feet of ore, it is claimed, samples better than $21 per ton.

NYE COUNTY.

F. Golden, one of the Tonopah leasers, says there are now 45,000 tons of ore on the dumps which will run from $60 to $600 per ton, or a total of prohably $6,000,000. A million dollars worth has already heen shipped. Mr. Golden says that the leasers will put up a mill on the ground and work this ore themselves. It is practically free milling.

Sinclair & Golden were compelled to cease work in their shaft at Tonopah at a depth 208 feet on a pay streak 4 feet wide that averaged $320 a ton. Their lease expiring January 1, they had to extract ore nearer the surface that is as rich.

WASHOE COUNTY.

W. C. Williams of Olinghouse while running a tunnel to strike a ledge on which he had been working in the surface, struck a blind lead which he thinks is hetween 30 and 40 feet wide and says it will go $15 a ton.

The Slip Co. at Olinghouse has milled 25 tons of ore from the 165-foot level, taking the entire vein, and the returns show $12 per ton value.

NEW MEXICO.

DONA ANA COUNTY.

The Copper Bar Co. at Organ, owning a group of eight claims, C. R. Anthony, Supt., is sinking a double-compartment shaft on the Torpedo No. 2. A hoist huilding has heen erected and the work of sinking is being done hy power drills.

GRANT COUNTY.

The Mineral Mountain M. Co. of Stein's Pass has bought from W. Morris the Beck mine at Kimball.

Marsalls & Wood of Lordsburg have sold the San Simon group of mines in the Virginia district to the Gibson Dev. Co. of Providence, R. I. The properties show hodies of high-grade copper and lead ores running well in gold and silver.

SANTA FE COUNTY.

The Consolidated M. & S. Co., owners of the Cerrillos smelter at Cerrillos, are contemplating the construction of an electric tramway to the Tom Paine mine and other properties in the same vicinity. These are old silver workings bought hy the company. The properties will be worked for silver and lead. It is helieved that the smelter will be blown in ahout the middle of January.

The Gibson Dev. Co. is working on the Erie and Buck Eye mines near Cerrillos. At the 70-foot level in crosscutting ore running on an average of 20 ounces of silver and from 35% to 40% lead has heen struck.

SIERRA COUNTY.

The Monument M. & M. Co. has heen incorporated hy S. Phillips, J. H. Schmitz and M. Baroch, capital $100,000, with office at Chloride.

SOCORRO COUNTY.

J. Kerr & Son have been awarded a 550-foot tunnel contract on the Little Charlie group at Mogollon by the Mogollon G. & C. Co. The contractors expect to make 90 feet a month. Four lodes will he cut hefore reaching the main vein on which a shaft is heing sunk to connect with the tunnel.

OREGON.

BAKER COUNTY.

The Excelsior M. Co. has made arrangements for a deep plant to sink 400 feet on their mine, near Sumpter.

Supt. Arthur of the California mine at Cable Cove has made a shipment of ore to the smelter, consisting of four cars, assaying from $25 to $330 per ton. An average assay of the 80 tons will closely approach $85 per ton. Transportation charges from the mine and smelter charges aggregate $20 per ton.

GRANT COUNTY.

W. Miller, E. H. Test and N. U. Carpenter of Ontario and M. M. Shillock of Portland own the Paragon group of claims near Granite, and have done development work to the extent of an 80-foot tunnel on the ledge, which shows a well-defined vein of ore carrying good values

E. D. Steincamp and G. Barrett of Granite have sold the Big Four group of mining claims at Granite to W. C. Rutter of Seattle, representing Pennsylvania people. Mr. Rutter has ordered a wagon road built from the main road to the mine. It is the intention of the company to do some development work on the property next spring.

JACKSON COUNTY.

The Pearl M. Co., which is composed of Central Point and Jacksonville people, has its mill installed and has commenced crushing. Elk creek is a tributary of Rogue river, 45 miles from Jacksonville, and the quartz deposits which the district contains were supposed to be barren until some one had assays made of samples of the ore, when it was found to contain gold in paying quantities.

JOSEPHINE COUNTY.

In the Illinois River district all of the hydraulic mines now have a full pipe head of water and are running night and day. The Oak Flat hydraulic mines are being completely overhauled and re-equipped with new piping, new giants, deeper and wider ditches, and a new plant. The Wilson-Meredith hydraulic mines of the Illinois are running two 5 inch giants with a 350-foot pressure. A grizzly hydraulic elevator is operated in these mines to overcome a deficiency of natural dump.

UMATILLA COUNTY.

A large flume is projected on the north fork of the John Day, near Ukiah. The flume will be 7 miles long, estimated to cost $7000 a mile. It will require 1,000,000 feet of lumher to build it and will he used to take water to placer grounds which will be worked by hydraulic elevators. A sawmill is heing erected to cut the lumber for the flume. A newly formed company from Sidney, Ohio, will do the developing. The placer beds are from 2 to 4 miles long and average 150 or 200 feet in width. They are said to be very rich.

UTAH.

The total valuation of Utah's mineral output for 1901 was $19,070,737, divided as follows: Gold, $3,945,303; silver, $6,945,922; copper, $4,227,551; lead, $3,951,960. The output for the past year shows an increase in valuation of over $1,668,305 over 1900.

BEAVER COUNTY.

The Milford G. & C. Co. has been incorporated in Salt Lake City, capital $300,000; L. L. Downing is president and C. Opelt, secretary. The company owns the Big Traction, Idaho and Mark Hanna claims in the Star district.

The Orphan Boy M. Co. has heen incorporated at Salt Lake City, capital $30,000. W. D. Williams is president and C. A. Doe secretary and treasurer. The company owns the Orphan Boy, Orphan Boy Nos. 1 and 2, El Dorado and Little Eva Williams in Star district.

BOX ELDER COUNTY.

The Iris Con. M. Co. has been incorporated in Salt Lake City, capital $100,000; C. C. Dey is president and A. J. Lowe, secretary. The company owns the Iris, the Iris Nos. 2 and 3, the Zephyr, Zephyr Nos. 2 and 3, Accident and Snow Storm claims in Box Elder county.

The Hardanger G. M. & M. Co. has been incorporated at Salt Lake City, capital $30,000. R. B. Hamilton is president and M. S. Lindsay secretary. The company owns the Golden Fleece, Tom Boy, Valley Queen, Silent Friend and Belle of the West claims, near Black Hills canyon.

JUAB COUNTY.

The management of the Yankee Cons., at Tintic, have decided to discontinue the extraction of ore and to decrease the force to ahout thirty-men on development work. It is said to be the intention of Franklin sydicate, which owns the hulk of the stock, to erect a smelter for the treatment of Yankee ores in conjunction with the output of their copper mines in Beaver county.

SALT LAKE COUNTY.

Work will be started this month on the Legislator claim of Forman & West, near Bingham. Close to surface the vein is showing 12 inches of lead carbonate ore of shipping quality.

SUMMIT COUNTY.

For the year 1900 the mines of Park City paid in dividends $1,577,500, out of a total dividend hy all the mines of Utah of $2,437,500. In 1901 the Park City mines paid in dividends $2,621,500, an increase over 1900 of $1,044,000, as follows:

Silver King	$1,275,000
Daly-West	547,500
Quincy	725,000
Ontario	74,000
Total	$2.621,500
All other mines of Utah	1,924,000
Total for Utah	$4,545,500

Of the total dividends of Utah mines to date, amounting to $44,200,900, the mines of Park City have paid $23,547,500, as follows:

Ontario	$13,737,500
Silver King	4,725,000
Daly	2,925,000
Daly-West	1,155,000
Quincy	725,000
Crescent	280,000
Total	$23,547,500

The ore shipments from Park City mines in 1900 totaled 146,001,370 pounds, as follows:

Silver King	67,156,580
Daly-West	50,712,805
Anchor	14,742,480
Apex	1,263,110
Valeo	588,990
Crescent	38,360

The total shipments in 1901 were over 267,000,000 pounds, as follows:

Silver King	69,806,010
Daly-West	71,245,000
Ontario	45,655,000
Quincy	40,549,000
Anchor concentrates	18,862,780
California	2,087,900
Daly	1,928,000
Barnes Bros., concentrates	394,000
Loring Bros	1,618,000
Clark, concentrates	105,000
Mayne & Leonard	184,000
Valeo (estimated)	15,000,000
Total	267,434,690
Total for 1900	146,001,370
Increase in 1901	121,433,320

The Shields M. Co. of Park City has heen incorporated, capital $37,500; H. Shields is president and E. P. Evans, secretary. The company owns the Shields, Brant and Bates claims at Park City.

TOOELE COUNTY.

C. I. Rader, manager of the Annie Laurie mine at Gold Mountain, states that the vein for which work had been directed in tunnels Nos. 3 and 4 has heen struck and that assays have shown $148 in gold from tunnel No. 3 at a depth of 460 feet, and $77 from tunnel No. 4 at a depth of 560 feet. It is expected to handle 6000 tons of ore a month at the mine.

WASHINGTON.

FERRY COUNTY.

The Trade Dollar mine at Republic is producing high-grade ore in hoth north and south drifts on the 299-foot level. Gold is visible in most of the ore.

Rapid progress is heing made in drlving the tunnel on the Golden Lion-Little Four at Republic. C. T. Porter is Supt.

The Butte & Boston at Republic is now raising to drain the water from the old shaft. The ore opened up the past two months is of a better grade than that encountered before, and it is estimated will pay a good profit after treatment and transportation charges are paid.

SNOHOMISH COUNTY.

The placer gold strike near Oso has caused a rush for the new field. A nugget weighing one ounce has heen found. Many nuggets are said to be as large as peas.

STEVENS COUNTY.

The Great Western Marble Co. has been incorporated, capital $600,000; P. S. Byrne is president and J. N. Jones secretary, with office at Spokane. The company has deposits of red, pink and hrown marhle near Chewelah.

Active operations are to he commenced on the marble claims owned hy the Inland Empire Marble, Brick & Lime Co., near Northport. The company has ordered a $3000 drill plant, which will include two rock drills, a quarry bar for getting out slahs, a 60 H. P. boiler and engine, rubhing heds, polishing tahles and all the other equipment needed to start work in a thorough manner. J. M. Nelson is Supt.

WYOMING.

CARBON COUNTY.

The Columhia mine, near Saratoga, has driven an 869-foot tunnel. There are also two shafts on the property, each 40 feet in depth and in ore. The property is shipping.

The Michigan copper mine, near Encampment, is reported to have nickel in

paying quantities. The tests of the Michigan ore show as follows: Copper 11%, nickel 6.84%, gold $5 per ton. The shaft is now down 100 feet and is in ore all the way. W. Weber is Supt.

FOREIGN.

BRITISH COLUMBIA.

The Mines Exchange, Ltd., of Nelson, says: The final payment of $4000 for the Blue Jay placer property on Smith creek, in Lardeau, has been made by the Duquesne M. Co.——The third payment of $1000 on the American mine has been made by the Mountain M. Co. and the remaining payments tendered. The mine is said to be looking very good.——About 3000 tons of high-grade ore will be sledded from the Nettie L. this winter to Trout lake, to remain there till the completion of the A. & K. Ry. in the spring.

Development work at the Last Chance mine is going ahead with sixty men employed. The long tunnel is now in about 2000 feet. Sufficient ore is being shipped from the Last Chance to pay operating expenses.——The Silver Cup mine has let a contract for the hauling of 800 tons of ore.

At the Sunset group in the Deadwood Camp preparations have been made to ship ore. H. Johns, Supt., claims a half million tons in sight in the mine, which will average from $16 to $20 to the ton. Over two miles of development work has been done. The ore is sulphide, values being chiefly in gold.

A strike of 10 feet of ore averaging $26 to the ton in gold has been made on the Union Jack group at Ymir. The property has been bonded to the Active G. M. Co. of Cincinnati.

It is stated the Athahasca mine is to be reorganized and that an early resumption of work is probable.

The fire which consumed the bunk house at the Silver King mine has suspended operations at the mine and will cause the smelter to close down as soon as a week's ore supply is treated. The direct loss to the company is said to be about $25,000.

A rich strike has been made in the Slocan dry ore belt on the Ottowa claim, an ore body 8 inches wide, assaying 3185 ounces silver to the ton, having been found. The ore hitherto found on this property has been of rather low grade, running from twenty-nine to eighty-five ounces silver to the ton.

Nelson, Dec. 21.

The Velvet mine says it will apply to the next session of the House of Commons for a charter to construct a railroad to operate by steam or electricity from Rossland to the mine, and thence to the Red Mountain railroad, in all a distance of 30 miles. The idea is to provide for the transportation of ore and supplies and to develop the resources of the Sophie mountain district, now handicapped by cost of transportation.

The following are the ore shipments made for 1901 up to date from the Lardeau.

	Pounds.	Gross Value.
Silver Cup	2,400,000	$180,000 00
Nettie L.	2,340,000	146,250 00
Triune	649,776	82,870 27
Cromwell	23,289	1,296 79
St. Elmo	12,000	510 00
Ethel	34,000	1,596 00
Broadview	52,000	1,664 00
Great Northern	56,000	1,344 00
Lade Group	12,000	1,320 00
Beatrice	442,000	32,239 39
Ruffled Grouse	11,770	507 19
Linson View	868	63 17
	6,232,703	$449,660 81

It is reported at Nelson that the U. S. smelters propose to make reductions in freight and treatment charges from $3 to $4 per ton on B. C. silver-lead ores during the coming year. This, it is considered, will partly offset the reduced price in lead and enable most of the mines to continue operations during the year 1902.

T. B. Stewart of Glasgow, Scotland, the representative of the Scotch syndicate that is to erect a lead refining works at Kaslo, is having plans of the site and surrounding properties prepared. The works as laid out are to consist of two lead stacks each, with a daily capacity of 100 tons of lead ore. The refining works will be on a scale sufficient to handle all lead offering for refining and are to be so arranged that the capacity will be governed by the amount available. The plant is also to have a smoke condensing works of sufficient capacity to consume all the gases and smoke from the smelter and roasting works. The whole of the works are expected, when fully completed, to occupy the greater part of the twenty-acre site upon which they are to be located. Mr. Stewart expects to have the preliminary arrangements completed by Feb. 1, 1902, when he returns to Glasgow to confer with his principals.

Commercial Paragraphs.

THE Marion Steam Shovel Co. of Marion, Ohio, has completed a large boiler shop and will build its own boilers in 1902.

THE contract for the machinery for the copper smelting and concentrating plant, to be built at once by the Calumet & Arizona Mining Co. at Douglas, Ariz., has been awarded to Allis-Chalmers Co.

THE business of the Sullivan Machinery Co. in the Southwest and Mexico has assumed such proportions that they have deemed it expedient to establish a branch office and supply depot at El Paso, Texas.

THE Keystone Driller Co. of Beaver Falls, Pa., has completed two buildings each 40x200 feet. The machinery for the manufacture of portable drilling machines has been installed and operations in the new buildings begun.

THE Compressed Air Machinery Co., San Francisco, Cal., has removed to the new and commodious building, Nos. 24 and 26 First St., where new and improved machine tools have been added to the department devoted to the manufacture of Giant rock drills and air compressors.

THE new plant of the F. M. Davis Iron Works of Denver, Colo., one of the largest manufacturers of mining and milling machinery between Chicago and San Francisco, is completed. About two years ago this company had a most disastrous fire, completely destroying their old works. The plant as now rebuilt is modern in every respect, covering an area of about four acres, with a total floor space of over 70,000 square feet. The different departments are well equipped with the most modern machine tools, driven by electric motors and commanded by electric and pneumatic cranes. At present the company employs about 300 men, with a yearly output of over half a million dollars. Their product is exclusively machinery for the mining, milling and smelting of ores.

UNDER date of Dec. 20, 1901, the International Acheson Graphite Co. of Niagara Falls, N. Y., write: "We take pleasure in sending you, under separate cover, a pencil made from Acheson graphite manufactured in the electric furnace. Few people realize fully the achievement which is represented by this statement. The pencil we are sending symholizes the successful duplication by art of one of nature's processes. Since the fifteenth or sixteenth century pencils have been made from the natural mined product—graphite. This was in fact the first purpose for which graphite was used, the name itself being derived from the Greek word meaning "to write." Not all natural graphites, however, are suitable for the manufacture of pencils. None but the most uniform, purest and highest grades can be used. That Acheson graphite can be utilized for the manufacture of lead pencils is a guarantee as to its purity and superior qualities."

THE "Village Blacksmith" is probably one of the most beautiful poems ever published. Its charming sentiment, like England's morning and evening drum beats, challenges admiration and respect around the world. Yet, while standing in awe of the "strong right arm" of the famous smith, how feeble is the blow he strikes compared with that of a modern steam hammer, which can strike a 500-ton blow! The statement is made that several such hammers are in constant use in the steel works of Messrs. Geo. W. Pennington's Sons in San Francisco, Cal. The village blacksmith may have proudly exhibited a forging of his handiwork weighing possibly 100 pounds, while Messrs. Pennington's Sons say they turn out "single forgeings weighing 30,000 pounds and over" and that "the muffled music arising from the never-ceasing stamp, stamp, stamp of the Pennington hammered steel shoes and dies in thousands of quartz mills easily encircles the globe."

THE year which has just closed has evidently been a prosperous one for the Crocker-Wheeler Co. of Ampere, New Jersey. They report a record-breaking midwinter business, and find it difficult to keep the production up to the demand. The following are some of the recent shipments: Two 400 K. W. generators to the Vandergrift Construction Co.; one 300 K. W. generator to Stetson & Co. of Philadelphia, Pa.; one 150 K. W. generator to the D'Olier Engineering Co. of West Camp, N. Y.; one 40 K. W. generator and twenty-eight motors to the Smith-Brooks Publishing Co. plant in Denver, Colo. The United States Tube Co. of Buffalo, N. Y., has been supplied with a motor equipment, and the electrical equipment of the Con. P. Curran printing establishment in St. Louis, Mo., which takes the place of line shafting, has been completed. Orders for a large number of motors have been received from Armour & Co., The American Bridge Co. and The Marion Steam Shovel Co. An order for a 30 K. W. special generator has been received from H. H. The Sultan of Linga. The machine is to be installed in the Royal Palace, which is on an island near Singapore.

Personal.

F. W. M. DRAPER is now manager Waldo copper mines, Waldo, Or.

E. M. EYRE has returned from San Francisco to Phillipsburg, Mont.

R. RESTANO has resigned as Supt. of the Golden West mine at Sonora, Cal.

W. MCCORNICK JR. of Salt Lake City, Utah, is sojourning in San Francisco, Cal.

W. J. KEATING has been appointed Supt. of the Keating mines near Clifton, Ariz.

CHAS. F. BRANT of the Yellow Aster mine, Randsburg, Cal., is in San Francisco.

DANA HARMON, late Supt. Gaston Ridge, Cal., mine, has gone East on a business trip.

W. H. WASHBURN is now manager of the mill of the Hoosier Boy G, M. Co., at John Day, Or.

ROBERT SCHORR is expected to return to Kennet, Cal., from Bielitz, Austria, about March 1st.

LEWIS T. WRIGHT, manager of the Mountain Copper Co. at Keswick, Cal., is in San Francisco, Cal.

HON. W. C. RALSTON has returned from San Francisco to the Melones mine, Calaveras county, Cal.

E. C. ENGELHARDT has left Denver, Colo., for Arizona, for an indefinite time, on professional business.

JESSE J. MACDONALD of cyanide fame is in Denver, Colo., whither he recently returned from Montana.

R. J. CORY, manager Allis-Chalmers Co.'s Denver office, has returned to Denver from Mexico and Arizona.

F. O. CORTMARSH, foreman of the Fannie Marie G. M. & M. Co. at Glencoe, Cal., is sojourning in Boston, Mass.

W. T. BURNS, manager of the Roanoke mine at Cripple Creek, Colo., has returned to that place from Boston, Mass.

A. B. KNIGHT has been elected to fill the Charles W. Clark Chair of Mining at the State School of Mines, Butte, Mont.

J. B. WHITE, for many years making his headquarters at San Francisco, Cal., has removed to Salt Lake City, Utah.

GEO. J. ROCKWELL, metallurgist of the Allis-Chalmers Co., has returned to Chicago from a professional trip to Arizona.

J. H. SANBORN, representing the J. George Leyner Drill Co., Denver, Colo., is now traveling through Nevada and California.

JNO. GILLIE of Butte, Mont., has been appointed Supt. of all the mines of the Amalgamated Copper Co., a new position just created.

D. MINIHAN, late of the Rio Tinto mine in Spain, is now manager of the Refugio and Belen mines at Jesus Maria, Chihuahua, Mexico.

G. D. CASE of Copper Hill, Tenn., has been appointed general superintendent of the new Amalgamated Co. copper smelting plant at Anaconda.

WM. THOMPSON of London, England, is in British Columbia, arranging for the construction of a smelter at the Tyee copper mine, near Victoria.

C. A. HOLLAND has resigned as Supt. of the Providence mine, near Carters, Cal., and has been succeeded by A. Scott, who has been in charge of the mill.

A. M. JOHNSON, manager of the Clyde gold mine at Cripple Creek, Colo., has been appointed manager of the Ophir mine at State Line, Utah, and of the Tiewaukee mine at Bingham, Utah.

T. L. ODDIE, the treasurer of the old Tonopah M. Co. of Tonopah, Nev., has been elected manager of the new Tonopah M. Co., vice J. H. Jenkins, resigned. F. Siehert, the manager of the old Tonopah & Salt Lake Co., has been appointed assistant manager.

Books Received.

"Velocity Diagrams, Their Construction and Their Uses," by Charles W. MacCord, professor of mechanical drawing in the Stevens Institute of Technology at Hoboken, N. J., 8 vo., 116 pages, 83 figures, is, the author states, an abstract of a series of lectures forming part of the course of instruction at the Stevens Institute. It will be of service and interest to students and workers in mechanical drafting and machine designing. Published by John Wiley & Sons, 43 East Nineteenth Street, New York. Price in cloth, $1.50.

Latest Market Reports.

SAN FRANCISCO, Jan. 2, 1902.

SILVER.—Per oz., Troy: London, 25¾d (standard ounce, 925 fine); New York, bar silver, 55¾c (1000 fine); San Francisco, 55¾c; Mexican dollars, 44¾c San Francisco, 43¾c New York.

COPPER.—New York: Lake, 1 to 3 casks, $13.40; carload lots, $13.00; Electrolytic, 1 to 3 casks, $13.00; carload lots, $12.87½; Casting, 1 to 3 casks, $12.60; carload lots, $12.50. San Francisco: $15.15. Mill copper plates, $17.15; bars, 26@20c. London: £49 per ton.

The restriction of the production of the Butte, Mont., mines continues. More significant than this, as showing the overstock of the market, is the large reduction made in the working force at the United Verde mine in Arizona.

LEAD.—New York, $4.00; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, har 5¼c; pig, $4.75. London, £10 3s 9d per ton = 2.24 cents per lb.

The American S. & R. Co., which last spring refused to take British Columbia lead-silver ores, is now reported to be offering concessions in freight and treatment charges to get these ores it then refused to take. This is clearly a move to restrict the production of lead from mines in the United States. The lead from the British Columbia ores is exported and does not come on the United States market in competition with the lead the American S. & R. Co. has accumulated. All the smelter capacity given to foreign ores is just that much that is taken away from United States ores. The price of lead in the United States will have a tendency to remain firm to consumers under the operation of this policy. The lead producers gain little from this maintenance of price, however.

SPELTER. — New York, $4.20; St. Louis, $3.75; London, £16 2s 6d per ton =3.58½ cts. per lb; San Francisco, ton lots, 5c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lh. lots, 10c; 300 to 500 lbs., 11c; 100-lh. lots, 13@15c.

IRON.—Pittshurg, Bessemer pig, $16.00; gray forge, $15.00; San Francisco, har, 2.60c per lh., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27.50; open hearth billets, $26.50; San Francisco, bar, 7c to 12c per lh.

TIN. — New York, pig, $23.50; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27¾c; 200 lbs., 27½c; less, 28c; har tin, ₱ lb, 32½c.

PLATINUM.—San Francisco, crude, $19 ₱ oz.; New York, $20.50 per Troy oz.

BISMUTH.—New York, ₱ lb., Suhnitrate, $1.50; San Francisco, $2.50 to $2.75 lt lots.

QUICKSILVER. — New York, $51.00 large lots; London, £8 17s 6d; San Francisco, local, $48.00 ₱ flask of 76½ lbs.; Export, $45.00

MAGNESIUM.—New York, $2.90 ₱ lb.; San Francisco, $3.75.

ZINC.—San Francisco, 5½c; slab, 5¾c; bar, 7c; zinc dust, N. Y., 6c.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

PHOSPHORUS. — F. o. b. New York 50@60c ₱ lb.

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $53.50, large lots.

TUNGSTEN.—New York, ₱ lb., 95c; San Francisco, $1.15.

POWDER.—F. o. h. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ₱ set; 14 oz., 40s., 9c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 30@31c ₱ lb.; carloads, 28@29c; in 10-lb. tins, 40c; sulphuric acid, in carhoys, 66% B, 2c ₱ lb.; soda ash, $1.90 ₱ 100 lbs.; hyposulphite of soda, 2¾@3o ₱ lb.; blue vitriol, 5¾@6¼c ₱ lb.; horax, concentrated, 7@8c ₱ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@ 2¾c; California refined, 1¾@2c; nitric acid, in carboys, 8c ₱ lb.; caustic soda, in drums, 3@4c ₱ lb.; Cal. s. soda, hhls., $1.00;

MINING AND SCIENTIFIC PRESS.

Whole No. 2164.—VOLUME LXXXIV. Number 2. SAN FRANCISCO, SATURDAY, JANUARY 11, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Gold Mining for 1902.

The fashion in mines for 1902 would seem to be gold. That is to say, the investing public who buy mines of some kind will this year buy gold mines. Copper and, in a less degree, silver, lead and zinc, have been public favorites for two years, but of late have proven fickle. To those who bought early and sold late—but not too late—these baser metal mines have been just as if they were the real gold mines to which they have now turned for more of fortune's favors. To the others, who bought late and sold not at all, copper, silver and lead are base metals indeed, since the mask of golden fortune in them is removed. They will not be footlight favorites again while present memories last, even though they are good, steady company for the real miners. Copper, silver and lead will pay well for the mining of them, even with the lower prices. They will not pay for the mining of as large quantities, nor will as many mines pay. The industry as a whole, however, is sure to advance under the stimulus of adversity. Better mines will be developed and a superior art of mining and metallurgy will be developed by the enforced economies.

Gold—the old time favorite, the many time favorite—is again enthroned in the eye of the public who mine as a diversion or as a speculation. Why it should not always be first favorite and the lasting fashion is one of the inexplicable things that only political economists claim to understand. Gold mining, despite its advancing years, still has the charm of mystery, and the mystery of adventure, to attract with. Its repute as being uncertain is just. Those who claim to know it best, and for whom there is no mystery in it, say it is easier to tell good gold mines from bad gold mines than to tell whether crops will fruit or fail. Certainly, when it is only to find the gold and enough of it, there is more certainty to gold mining than to the mining of the other metals, where, in addition to finding them and enough of them, is added the uncertainty as what they will exchange for measured in gold.

There is no competition in gold mining. There is, as there very properly should be, a never ending effort to improve its methods and extend their application. The success of one gold miner, or one set of gold miners, in doing this, does not mean a possible increment of loss to other gold miners. On the contrary, it means an added increment of gain to the others and a new gold field opened for other gold miners. Their incoming cannot make an overproduction, no matter how much more production they may make.

There has been at times a suggestion that the gold mines of the world would be gathered into one great combination or trust. The possibility need inspire no fears for lessened profit in the industry. Independence is possible with gold mining as it is possible with no other kind of metal mining. It is not necessary to make a market for the metal; it is not even necessary that it should be coined to be exchangeable. While a monopoly of gold is conceivable, it is not seriously conceivable as being effected through the mining of all the gold from the mines. The people who would make such a monopoly would get the gold after it is mined with less risk.

The year 1902 will be a good year to open new gold mines. The owners of old, long-closed gold mines, the owners of gold mine prospects, should bring them out onto the bargain counter while they are the fashion and while people who can buy will look at the yellow gold in the rock, and listen to and believe the mystery and romance of gold mining in distant lands. The fashion, while it should endure, past experience teaches will not last indefinitely. The days will come to it when the public think they know the mystery. They will ask too much of it, and, not getting it, will turn their money to other markets. So it is that now is the time for gold mines.

The prospectors can now bring their gold mines to the capital that a few years ago would not consider them. They should not fail to do it while the fashion lasts. There is no indication at the present time that any preference will be made as between lodes and placers. The possibilities of profit from both are now fully recognized.

It does not take as long a time to make a gold mine as it does to make a copper mine. The owners of the undeveloped gold mines have an advantage in this that has been denied to the owners of some copper mines. They are not as likely as the others to have undeveloped and unsold mines left when the fashion changes.

Most of what is gained in gold mining lasts. The new mines opened, if they pay, stay opened. A change of fashion in mines does not close them down. Not all the new gold mines that are opened prove good mines, but the continually advancing skill in the art is limiting the range of possible failure. It is easier to know in advance the chances, so as to take them if they seem to balance favorably, or to leave them, if the balance of chance is the other way.

Shaft No. 6 on Niagara Vein, Congress Mine, Congress, Arizona.—(See Page 18.)

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....$3 00
All Other Countries in the Postal Union.....4 50

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....Publisher.

San Francisco, January 11, 1902.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Congress Concentrating Mills, Congress, Arizona; Shaft No. 6 on Niagara Vein, Congress Mine, Congress, Arizona, 15. No. 2 Incline Shaft, Congress Mine, Congress, Arizona, 18. The DeLaval Steam Turbine Blower; The DeLaval Turbine Wheel and Nozzle, 19. Network of Small Quartz Veins in Porphyry Dike, 20. No. 1 Sizer in Operation; Concentrators in Operation, 22. Mining and Metallurgical Patents, 23 The "Duro" Blow-Off Valve, 24.

EDITORIAL.—Gold Mining for 1902, 15. Quicksilver Mining in California; Coal Consumption of California; The Cost of Copper; A Miners' Home; Field for Invention of Mining and Metallurgical Apparatus and Methods, 16.

MINING SUMMARY.—25-26-27-28.

LATEST MARKET REPORTS.—28.

MISCELLANEOUS.—Concentrates, 17. The Mind of the Engineer; Congress Mine and Mills, Congress, Ariz; Man Power and Its Cost, 18. Solving the Fuel Problem in Arizona Mines; The DeLaval Steam Turbine; Grant of Titls to Mineral Lands in the Philippine Islands; Cyaniding Silver-Bearing Tailings; Mining Experts, 19. A Complex Vein Formation in Porphyry; The Standard Assay Certificate Form; U. S. Gold and Silver Production in 1901, 20. Corundum in Montana; Important Decision to Dredging Companies; Geological Society of America Meeting; New Rules for Timber; Mineral Experiment Stations, 21. New Concentrating Plant; Substitute for Borax in Soldering: A Large Hydraulic Mine Pipe; Liquid Fuel Instead of Coal, 22. Mining and Metallurgical Patents, 23. The Velocity of Steam; The "Duro" Blow-off Valve, 24. Personal; New Patents; Notices of Recent Patents; Commercial Paragraphs: Recently Declared Mining Dividends, 28.

QUICKSILVER MINING is receiving increased attention in California. There has been no advance of price during the last year; but, on the other hand, there have been no fluctuations in price which could make investments in it uncertain. It is notable that old mines are not increasing production, even though considerable exploratory work has been done. The demand for the metal is increasing, and the extension of gold mining, which can be anticipated during the current and succeeding years, will still further increase the demand. It is recognized that the increase of production and the replacement of the diminishing yield of the present mines must come from new mines. These are being sought for in California, and capital seems disposed to interest itself in the industry. Old prospects that were turned down many years ago are being dug up again and re-examined. Some of the old mines closed down years ago, when quicksilver prices were much lower than at present, and when methods of extraction were wasteful and costly, are being reopened. With present prices remaining established, there are good profits to be obtained from the reopening of some of these old mines and the exploitation of some of the old prospects.

THE coal consumption of California for the year 1901 is estimated at 1,834,785 tons, as compared with 1,889,128 tons in 1900, 1,740,027 tons in 1899 and 1,832,273 tons in 1898. There has been an enormously increased consumption of fuel oil, but from figures of coal consumption it would appear that the oil has so far only held the coal consumption steady, and that the supply of oil is only keeping up with the gain in fuel consumption. When to the mechanical power represented by the fuel oil consumption is added the electrical power developed from new water power plants during the last two or three years, the sum total will exceed the energy represented by the coal consumption of 1901, which, as noted above, is very little different from the coal consumption of each of the three preceding years. It is a fair inference from the comparative figures of coal consumption on one side, and oil fuel consumption and electric power development from water on the other side, all of the latter being a development since 1898, that the manufacturing industries of California have in the aggregate doubled in the last four years. The rate of growth has been phenomenal if measured against the growth of the preceding years. It is notable that where in other places progress in industry is measured by increases in "coal consumption," here in California it is now written "fuel consumption," and with the increasing development of water powers it may soon come to be written "electrical consumption."

The Cost of Copper.

With the lowered sale price the cost of production of copper is receiving a great deal of attention, and much hastily gathered misinformation relating to it is appearing in print.

In the Lake Superior mines the cost of producing copper is inversely as the richness of the ore in metal. The ore in the mines is not uniform in its content. The general business policy followed at these mines while copper was at 17 cents a pound has been to mine out the lowest grade ores that would yield enough copper to pay a small profit. The cost of copper at many Michigan mines has, in following this policy, been from 14 to 16 cents a pound. Now that copper sells for only 12 cents, the policy at these mines will be to take out higher grade ores and thus reduce the cost per pound of their production below 12 cents. Not all of the mines will be able to do this, the quantity of sufficiently high grade ore being too small to permit of an economic production. That is to say, these mines cannot be worked to the capacity of their plant or proportionate to the investment they represent. The larger and older mines can adjust the grade of their ore output to the lowered sale price.

The Calumet & Hecla mine, when copper was selling three years ago and longer at 10 cents a pound, and less, was reducing 4½% ore—ninety pounds of copper to the ton. The cost of mining and reducing ore of this grade, aside from the refining, is no more than if the ore contained only 1% of copper. It is absolutely less costly now than five years ago to mine and mill these ores. The Calumet & Hecla produced copper at 4 cents or less per pound when copper was selling from 10 cents a pound down. If, as is claimed, it has been costing 9 cents a pound to produce copper when copper was selling at 17 cents, it is evident that the 4½% ore was left in reserve and ore grading about 2% copper has been mined. To maintain its profit margin against the lowered selling price, it will take the exceedingly simple way of mining richer ore.

The Calumet & Hecla will not be alone in this policy. In 1894 the Atlantic mine, with copper averaging a sale price of 9 cents a pound, made a profit from ore that yielded only seven-tenths of 1%, or fourteen pounds to the ton. The segregated costs of this production were per ton of ore: Mining, including breaking and sorting, $0.7518; rail transportation to mill (3 miles), $0.0303; stamping and separating, $0.2330; freight to New York, smelting, refining and marketing, $0.1771, making a total of $1.1922, or $0.08515 per pound of copper produced. The cost of production at this mine is now stated to be 12 cents, which would simply mean that one-half of 1% ore was being mined. It would seem quite safe to assume that there is to be no material reduction in the output of copper from the older of the Lake Superior mines, and not much, if any, reduction of profits earned by them.

In the Rocky Mountain and Pacific States copper mines the effect of the reduced sale price is not so readily compensated for by mining higher grade ores. For example, the Le Roi mine at Rossland, B. C., yields a grade of ore running close to 1.3% copper—26 pounds to the ton. The smelter pays for 70% of this, or 18.2 pounds. On this quantity a reduction of 5 cents a pound on the settling price means $0.91 a ton less return for the ore, and a third less net value in the ore reserves. The different character of the underground mining from that in the Lake Superior copper mines introduces physical difficulties which make it impracticable to increase the grade of ore mined without at the same time increasing the ton costs and reducing the life and total net output of the mines.

In mines where copper is a larger part of the total values, as compared with the gold and silver, the cost of production is a still more serious matter. At Butte, Mont., the gold per ton of ore is low—$0.70 to $1, the silver somewhat larger. But the gold and silver not aggregating anywhere near the ton cost of mining and reduction, this lower sale price of copper makes a much larger proportionate reduction in the total value of the metal production, and a larger cut into the profit margin under 17-cent copper. The mines of Butte are now being worked to depths at which, though the metal contents are more uniform, they are lower in quantity. A lower sale price of copper cannot be as certainly compensated for by mining a higher grade ore as was practicable when these mines were worked closer to the surface. The problem of adjusting costs to the new price conditions is certainly a serious and difficult problem, if anything like past production and earnings are to be maintained. Costs, which are stated to be from 10 to 12 cents a pound now for the production at all but a few of the mines (the Boston & Montana being stated at 7 cents), cannot be reduced much without reducing the output of metal and the life of the mine very materially.

In Arizona, Utah, Nevada and California the mines are much younger. They are, as a rule, working at depths and in deposits where nature has made a secondary concentration of the valuable metals. In many of them the gold content alone is in excess of ton costs. The silver content is often proportionally larger with straight pyritic copper ores than at Butte. There are definable lines between bodies of high and low grade ore, making it practicable to remove the one and leave the other. These conditions are all favorable and minimize the effect of the reduced price. It is possible to commercially compensate it by reducing costs without largely affecting the output. It is notable that the United Verde mine in Arizona is credited with producing copper at 3 cents a pound, the Utah Consolidated in Utah at 4 cents. To these mines and others like them the reduced price of copper means less profits, but does not involve changes in mining practice to reduce costs. They are much more independent of the price of copper than even the Lake Superior mines.

A Miners' Home.

Some months since this journal published a letter from Col. N. E. Linsley of Spokane, Wash., earnestly suggesting the establishing of a home for old prospectors. The claims of these old pioneers of mining on the consideration of those who have found fortune from mines were very convincingly stated in the communication, which at the time created some discussion.

Since then Mrs. Mary Judge of Salt Lake City, Utah, has endowed a home for aged and disabled miners in that State. The inspiration for Mrs. Judge's kindly act is understood to be the desire to perpetuate the memory of her deceased husband, whose fortune was accumulated from mining.

The example made of what a woman can do this journal hopes will be followed by others giving from their abundance the comparatively small sums required to maintain in comfort and security through their last years of life the old miners and prospectors of the West. They do not require pretentious and costly establishments, but such homes and surroundings as will be most like those they have been accustomed to. For these men such a place as Mrs. Judge's $10,000 will provide will perform a great deal of useful service. There is ample opportunity for more $10,000 establishments. One might very appropriately be located where Col. Linsley suggested, at Coloma, where John Marshall made the discovery of gold in California.

THE field for invention of mining and metallurgical apparatus and methods is this year essentially the field of utility provided by the necessities of small mines. There are many more small metal-bearing mines than there are large metal-bearing mines. There is no physical upper limit to the size of mining plants that can be constructed. Invention has of late been largely directed to making these large establishments more efficient economically. So long as the margin of profit was high these great mines had a commercial advantage over the smaller ones. With lower prices this supremacy in economy becomes questionable. If the great mines cannot run at full capacity their great works become for that time a cost burden on the output, which brings them closer to the little mines in economy. The latter now need the same economical development that the great mines have had. It is not desirable to make economies by reducing wages. It is desirable to make economies by increasing the per capita output of labor. Industry, as a whole, will be better for the change of economic conditions. It is for invention to provide the ways, now that the necessities of the small miners have created the means.

Concentrates.

A RUSSIAN "pood" of gold is $10,000.

THE average California loss of quicksilver is about one pound to every fifty tons of ore.

THE ore mined by the Mountain Copper Co., Keswick, Cal., carries from 4% to 6% copper.

TO FIND the resistance of an iron wire, multiply its length by 72 and divide by the circular mils area.

STEEL may be heated to any degree before redness, and it will remain after quenching as soft as before.

A STAMP dropping ninety times per minute, with a cam lift of 7 inches, will take just two-thirds of a second for lift and drop.

LIMESTONE is a "mineral" within the meaning of the United States mining law, and may be located and patented as a mining claim.

THE left hand side of a horizontal boiler is the side corresponding to the left hand of a person when standing in front of and facing the boiler.

THE Golden Fleece mine tunnel, near Lake City, Colo., is lighted by electricity, incandescent lamps being set 100 feet apart through its entire length.

THE duty of a mine owner as to ventilation of his mine and keeping it clear of standing gas is made imperative by the Act of Congress of March 3, 1891.

THE first gold mine in the United States is stated to have been the Barringer, Stanley county, N. C., a placer mine that later paid as a quartz claim.

MICA of clear sheets and good cleavage, 2 inches by 3 inches, is worth about 15 cents per pound; 2x4 inches, 13 cents; 4x6 inches, 55 cents; 5x8 inches, $1.25.

STEEL is now of occasional use in the "timbering" of shafts, posts being used made of steel angles riveted together, and supporting the lagging of 4-inch planks.

A MINING LOCATION made by agent without actually going on the claim to post the notice is legal. If signed by the locator, an agent can post it on the claim and witness the posting.

TO PRODUCE bullion having gold fineness of 500, 2.4548 ounces Troy bullion of 1000 gold fineness, or 3.0685 ounces Troy bullion of 900 gold fineness must be added to 32.3 ounces Troy of bullion 462 fine, gold.

IN a discharge line 2000 feet long through two 5-inch pipe lines would flow 11,180 gallons of water, while through one 7-inch pipe line would flow 12,965 gallons, allowing that in both cases there was the same head.

THERE are several large nuggets of platinum in existence, notably in Russian Government cabinets. Probably the largest is that owned by Baker & Co., the Newark, N. J., platinum refiners, which was illustrated in these columns some years ago.

A COMPRESSED AIR DRILL can be kept from freezing by use of the warm discharge water from the mine. A ¼-inch pipe attached to the exhaust ports of the drills and the warm water piped into them will keep them free from frost, though half a mile from the source of supply.

THE ore taken out in sinking a shaft has been known to pay the cost of sinking it as it progressed. It is claimed that from the Clark shaft on the Mizpah Lode at Tonopah, Nevada, the ore taken out in sinking returned $664 for each foot sunk to 200 feet depth. This was more than the sinking cost.

A CHIMNEY 120 feet high will burn twenty-one pounds of coal per hour for each square foot of grate. The chimney will furnish draft for 123 square feet of grate. While the force of the draft increases directly as the height of the chimney is increased, its capacity for burning coal increases only as the square root of the height.

IN the production of white lead by the electric arc gases are blown upon the lead while it is in a molten state in the presence of the arc. The fumes produced are blown over into chambers having cloth covers or roofs. The powdered white lead falls down and the unconsumed gases pass through the cloth, to be used again.

IN the acid open-hearth process of steel making the bottom of the furnace is made of refractory siliceous sand. In the basis process dolomite or magnesite, or a combination of both, is used, and during the process limestone is employed to unite with the silicon and form a basic slag. The character of the lining used gives to the process its name, as acid or basic.

GREASE in smallest quantities, or gum or resin from blocks or lining of sluices, is ruinous to mercury, causing it to flour. Distillation is of little use, as the substances mentioned pass over in retorting and condense again. Where other chemicals are not easily obtainable, washing the mercury in a strong solution of potash obtained by leaching wood ashes will purify it.

USUALLY the power required to run a jig or jigs is a matter determined by the area of the sieve, the height of the tailboard, the specific gravity of the material to be jigged, the length of stroke and number of strokes per minute, though there are even other factors in the problem. A 1-sieve jig should have at least 1½ H. P., a 3-sieve jig 2 H. P., and a 4-sieve jig 3 H. P.

IN heavily sulphuretted ore in Colorado, stamps have been in use as light as 550 pounds, having a 16-inch drop of about thirty to the minute. In California stamps weighing as much as 1400 pounds have been used, though the practice is not common, the stamps ordinarily being from 900 to 1000 pounds in weight, with a speed of ninety drops per minute, the height of drop being about 8 inches.

WHILE it is theoretically practical to utilize the waste heat from a roasting furnace in making steam, yet in practice it has usually been found that the pipes used in such generation ordinarily become so coated with flue dust in a short time as to prevent heat absorption and interfere greatly with steam production, though as a feed-water heater, attached to a boiler, considerable success has been attained.

THE best known antidote for cyanide poisoning is peroxide of hydrogen. It should be administered hypodermically, at intervals of two and one-half minutes, until the patient gives signs of returning consciousness. It is necessary that the antidote be administered at once; a delay of even two minutes might prove fatal, hence the peroxide and hypodermic syringe should be immediately accessible.

MINIUM is a natural mineral, oxide of lead, composition Pb_3O_4 or $2PbO\ PbO_2$. It occurs pulverent as fine crystalline scales. The color is a vivid red, sometimes mixed with yellow. It is noted as occurring at localities in Germany. There is no reason why it should not be found in Nevada. The specific gravity is 5, which would make it somewhat heavier than magnetic oxide of iron. The mineral is used as a base of some paints.

A QUARTZ LOCATION is legal even if as a fact the locator does not stake the end lines parallel. A subsequent locator can, however, come within the end lines with his location and by care in making his location seclure a valid claim to the ground that the first locator had erroneously included. A subsequent locator can not by his location get any right to the particular lode located by the first locator within the end lines of that locator, even if the end lines are not staked parallel.

IN the case of Strickley et al. vs. Hill, 62 Pac. Rep. (Utah), 893, the court held that if a citizen and an alien jointly locate a claim not exceeding the amount of ground allowed to one locator, such location is valid as to the citizen, or to one who has declared his intention to become such; and a conveyance by him, through an alien, to another citizen, conveys a complete title to the claim located, provided all other provisions of the law were complied with, and there be no intervening rights.

STEEL, iron and other metals grow "tired" and lose much of their strength and elasticity by long-continued subjection to quite moderate stress or vibrations. When allowed to rest for a time these metals recuperate and recover their pristine strength. This observation has been made so often, and has been so thoroughly proved by repeated laboratory tests, not only on a small scale, conducted with the greatest care and accuracy, but also upon a large scale, with full sized bridge members and other commercial forms of steel and iron, that it has become generally accepted by engineers as a positive and well-understood law.

A MINING CLAIM can not be located on land which has been patented, no matter what kind of a patent it is, unless it be a known lode at the time the United States Land Office receiver's certificate is issued showing payment by the applicant for the land. No lodes or minerals are subject to location except those that are on public land or are expressly reserved within grants. Extralateral rights are only acquired as an appurtenance to lode locations on public lands. Lodes discovered subsequent to the issuance of patents other than lode patents can have only such rights appurtenant as the owners of the land choose to grant.

IF eight persons make eight separate placer locations of twenty acres each, and seven of the locators convey their claims to the other, it requires annual assessment work of the value of $800 to maintain the possessory right to all the claims. In the case of a single location, embracing 160 acres of placer mining land, the locator to maintain his possessory right would not be required to expend $100 worth of mining labor on each twenty acres; his possessory right to the entire 160 acres might be maintained by performing thereon $100 of actual mining work, designed in good faith for the improvement of the 160-acre location as a single mining claim.

THE Government in reserving mineral in lands that it grants reserves only the mineral that is known at the date of the grant. The equity of title to land after patent by the United States rests with the State. The State can make laws affecting the title, provided no conflict is made with the general rights to property guaranteed by the Constitution of the United States. The State could make laws by which it could in effect give extralateral rights to mines in lands patented by the United States without such a reservation, but it would seem as if it could only do so for itself (the State), and would have to provide compensation to the owner of the patent.

THE spontaneous ignition in the gas engine is most likely brought about by hot metal, and probably occurs close to the regular point of ignition. Its trouble arises from the tendency to become earlier and earlier. By occurring considerably before the proper time, it checks the speed of the engine and increases the successive heating which is its cause. Scale or a failure of water in the jackets may bring it about; possibly the cocks controlling the division of the water between the cylinders may not be properly set, thus allowing one cylinder to get too hot, while the combined outgoing water has a reasonable temperature. Leaky exhaust valves or igniters become much overheated and are the chief cause of this trouble. They should be kept tight.

THE average price of lead in New York city during the administration of Harrison, 1888–92, was $55 08 per ton. Under Cleveland's last administration, 1892–96, it was $42 per ton. The American Smelting & Refining Co. controls the price of lead absolutely, and buys its lead ore from the miners upon the basis of New York prices from day to day. The company was organized in April, 1899. The price of lead in May was 4.42½ cents, in June 4.47½ cents, in July 4.52½ cents. For the rest of 1899 lead did not fall below 4.60 cents, and in December was 4.75 cents. It remained at 4.70 cents in 1900 until May 11th, when it fell to 4.42½ cents, the next week it declined to 4 cents, in June it fell to 3.81¼ cents and advanced to 4 25 cents in July. It has been reduced to 4.12½ cents, to 4 cents, and now to 3½ cents.

IF COPPER exists in an ore as a sulphide, cyanide will have little if any effect upon it, and so small an amount will be dissolved that the work of the cyanide in recovering the gold will not be interfered with. If the copper exists as a sulphate or carbonate it may be removed and saved, and if in sufficient quantity, quite profitably, prior to the application of the cyanide. The greatest difficulty with which cyaniders have had to contend has been the effects of the products of decomposition or oxidization of sulphurets, but they are gradually getting the mastery of even these. There is one difficulty, however, which floors the worker with any process, and that is the lack of values in the ore. Give most cyaniders ore containing reasonably good values in gold and silver, and plenty of it, and they will find a way to get the values out.

A PATENT to land obtained under the Desert Land Act makes exactly the same grant that a patent to agricultural land homestead or pre-emption makes. Most of the decisions construe the grant as absolute and carrying everything within the vertical planes of the boundary lines. One decision of a Nevada trial court says a mineral claimant can follow the dip of his vein under the agricultural land. This decision is up on appeal now. There is one form of the question which "Concentrates" believes has never been litigated. It is this: A tract of land is patented as agricultural land subsequent to it becoming known that a lode having its apex outside the boundaries dipped beneath the tract, would the patent to the agricultural land carry the vein of ore, or would it be excluded as a known vein? The latter would seem to be the reasonable view. The essence of the reservation made by the law would seem to be the mineral lode that was known to be in the ground, regardless of whether or not the mere superficial evidence of it was on the surface of the land or not. It would hardly seem to be material whether the lode was located or not before patent to the agricultural land issued if the lode was known to exist and known to dip into the agricultural land. It has been repeatedly ruled that the right of prescription does not run as against the Government.

WET PROCESS for treating copper ore in small quantities, known as Henderson's, is successfully used in the extraction of the 2% or 3% of copper contained in pyrites roasted at vitriol works for the sake of the sulphur therein. These residues contain a very small quantity of silver and a small proportion of residual sulphur. They are mixed with a sufficient quantity of common salt and heated in a muffle furnace to a very moderate red heat. A muffle furnace is heated externally so that the products of combustion from the fuel can not gain admission. Air is allowed free access to the mixture, and any fumes evolved are withdrawn by flues. The copper sulphide present becomes copper sulphate, and this reacts with the common salt, forming copper chloride and sodium sulphate, while the silver is simultaneously converted into silver chloride. On withdrawing the charge it is transferred to large vats fitted with false bottoms covered with brushwood to serve as a filter and there treated with water which dissolves the chloride of copper and the common salt, the brine thus produced dissolving the silver chloride also. The solution is then filtered off into a separate tank and treated by Claudet's process, which consists in mixing it with a solution of iodide of zinc containing just enough iodine to combine with all the silver present; silver iodide is thus produced, containing small quantities of gold and some lead, and, as it is insoluble in brine, it separates out in the solid state and sinks to the bottom. On filtering the liquid again, a solution of chloride of copper free from silver is obtained; and the solid iodide of silver, being carefully collected, is treated with metallic zinc, which decomposes it, reforming an iodide of zinc that may be dissolved in water and used to separate the silver from a fresh batch of ore, while the silver, now in the metallic state, is melted and refined. The working loss of iodine is made up by adding iodide of potassium. The solution of chloride of copper obtained in this way, or that of sulphate of copper recovered from ores that have undergone a sulphating wash, may be made to yield up the copper therein in a powdery but metallic form by the well-known process of placing fragments of scrap iron in the liquid in large tanks, or as it flows through long channels. The iron exchanges places with the copper, because its combining power for sulphuric or hydrochloric acid is greater than that of copper. It gradually dissolves into the solution, and a precipitate of copper separates in the form of cement copper, which is seldom sufficiently pure to be used direct, and is therefore subsequently refined in furnaces or electrolytically.

The Mind of the Engineer.

Written for the MINING AND SCIENTIFIC PRESS by CHARLES H. FITCH.

Two mining men of London have heen discussing what constitutes a mining engineer. One says that he should have "some" practice, uttering the usual and proper idea that a young man should sit awhile at the feet of Dame Theory, then leave the dame school and go out into the rough, adult world and apply what she has told him, finding that he has learned a great deal that is not so, or which he has not rightly understood. After he has taken a few falls, trying to check his theories with practice, he is no douht a wiser, more modest and a hetter man.

The other disputant contended that a mining engineer should not he a conglomerate of some theory and some practice, hut that practice alone should be the touchstone of his profession. Could he get down to husiness and "do" it? That is the question.

I agree with hoth of them, respect the academic, hut how most profoundly to the practical. In my business I keep several hunches of addresses of people upon cards. One hunch is laheled "Academic Interests." I am bound to admit that this suffers from inattention when compared with other hunches of cards relating to people with whom associations are enjoyed mainly on account of the "mammon of unrighteousness"—orders—and not on account of thirst for knowledge.

It is proverhial that shoemaker's children are illshod and that the physician is taunted to heal himself, and it is not surprising that scientific professions should have no very scientific method of testing the qualifications of their own memhers.

A practicing engineer is an active product, as a bridge truss is a static product of engineering science. It is not convenient to test a hridge to destruction to determine how good it is. Only samples of its material can he tested. George J. Bancroft has told us how to proceed in sampling a mine for its values; hut how shall we sample an engineer for his ahility? In a general way, by their works ye shall know them; hut we can rarely do more than take a sample of work and make a guess estimate for all the rest. As for education, there is something notahly unscientific and inadequate in the preparation which does not qualify for work, but leaves untouched great mental areas which will determine whether or not a man's studies are to he of any practical use. In spite of the brave distribution of millionaires' money, my ohservations at three richly endowed universities convince me that much of our education does not reach the working mind at all, and is of little more effect than striking the hody of a man with the outside of a hook. I reckon that there are men of much ahility and value who would fail flatly to pass again examinations in calculus and spherical geometry, which they passed with flying colors when they were juniors in "tech" and had no practical qualifications to speak of.

We look at the face of an applicant, and prefer to see it open and agreeahle, with an expression of quiet confidence and self-respect. We do not usually give him a "stunt" to do, hut inquire what he has done, and with whom he has heen. Then we take the chances with him or not.

In some cases long schedules are suhmitted to he filled out hy intending employees, and covering parentage, previous work and anything that would suggest itself in the way of precaution should crooked or weak places exist in the applicant's career. But some shrewd managers put little reliance on such methods. "Young man, put hack your letters and parchments into your pocket. Carry that face of yours down South and tell the people you love the country, keep your eyes open and sell engines." The spirit of gallantry and adventure gives point and progress to enterprises in engineering husiness. It would he an incredible blue-stocking who would look with favor on a suitor caught reading a hook on "How to Win a Woman." Books have their uses, hut it is a stupid fellow who accepts a hook as a suhstitute for a mind of his own. I shun despotic hooks as I do despotic people, and say to them: "Take your shadow off from me. Get out of my sunlight."

Let us see, then, what can he done. As a deacon, rising in meeting, asks his brethren to accompany him in prayer that his feehle petitions may be strengthened, I ask your readers to accompany me in thought on this important subject of the engineering man. Difference in men is difference in their thought.

If we had the gift of a mind reader and could range in comparison the mental processes of a capahle alongside those of an incapahle mind, we would find some interesting contracts which would henefit the art of technical education. Such a survey of the incapahle mind might show like a magnified section of cast metal—separated spots or crystals in a matrix of other matter; while the capahle mind might show like a magnified section of wrought metal, with its crystals fihrous, laced and interrelated. In other words, the material of incapahility, the primal stupidity which appalls us in our efforts to reform others, and must be acknowledged to occasionally crop out in ourselves, is the raw material which, subjected to a process of working, becomes rearranged and connected up, so that ideas do not each remain apart, crystallized, in its own cell, hut communicate one with another in the circuits called rational processes of thought—those stresses or impressions which they receive from outside.

Another hroad measure of analogy which I get from the nature of materials for the benefit of civil government, is that, as cast iron is chiefly good for compressive strains, and cannot he safely trusted in tension, so persons whose rational faculties are of a low instinctive order must be governed. The effort to redeem them from oppression on ideal sentimental grounds, hy erecting them into high structures of self-governmeut, is like huilding cast iron in edifices requiring the tensile strength of steel. The dream hreaks down in the test of realization. An American engineer, accustomed to deal with independent citizens, and going to take charge of foreign mines, may be puzzled to deal with the servility and duplicity of native laborers until he learns that he has to use minds which render good service only under compression.

Wrought iron and steel are dual in their resistance to stresses, withstanding hoth tension and compression. The rational mind is also dual in its systems of comparison and imagery. Two poised arms are required in the halance which is to weigh and consider. The rational mind is also dual in its moral aspect, coupling with every claim for a right an acknowledgment of a duty, and not heing, as most of us still are, very much stronger in claims of right than in assumptions of duty.

As all men are and have heen, in measure, hoth capahle and incapahle in different matters, we ought to he ahle to take an interior view of the suhject and draw some scientific deductions for our own benefit from the composition of our own minds. This suggestion, for which I claim a practicality as strong as anything in the specifications for material machinery, is analogous to the reactions of automatism in engines and in mill arrangements, and self-induction in the currents of motors. These principles do not make us ahsolutely independent. That is a fatal idea which turns us hack to stupidity and isolation. What they do is to build us up on two mutually supporting sides, larger influence with others and larger control of ourselves.

Congress Mine and Mills, Congress, Ariz.*

[STAFF CORRESPONDENCE.]

The new concentrating mill of the Congress Gold Co., Congress, Ariz., operates steadily on 150 tons daily of sulphide ores, making ahout fifteen tons a day of coucentrate that runs ahout 7% silica and over 40% iron. The hulk of the siliceous matter is taken out hy the Standard concentrators in use. The principal values, which are in gold, are carried in the iron hase. However, the ores include considerable amount of oxidized material, the values in which are recovered in the cyanide work. The tailings from the tables are all cyanided, those of the clean siliceous nature passing direct to the leaching tanks, the finer slimes containing oxides and sulphides heing first passed through a Brown roaster. The new mill has forty stamps, 1000 pounds each, dropping 100 to the minute, the screens being 20-mesh. The old mill, which has heen remodeled and provided with some new machinery, will be operating hy Jan. 1, 1902, and has forty stamps and eight vanners. Half of the concentrating floor will be used for a while in experimenting with various types of riffle tables. It is proposed by Manager W. F. Staunton to make some comparative tests.

The power plant of the new mill comprises a 12 and 24x36-inch compound condensing Corliss engine of the Allis type; a Rand air compressor, 14 and 22 and 19 and 12x30 inches. The condenser combines with a surface feed heater, the cooling of the circulating water in a Barnard fanless cooling tower. The plant includes four return tuhular hoilers, each 54 inches hy 16 feet, which work at 125 pounds steam pressure and are fed hy automatic stokers. This boiler plant will also supply power for the old mill.

The Congress mine has heen operated during the past twelve years, and the manager states there are greater ore reserves to-day than at any prior time. As has often heen noted, the main incline shaft on the Congress vein opens that ledge at 75-foot stations down to 3150 feet depth on the dip of 45°. Much of the recent production and development are on the Niagara vein, on which there are two shafts 3800 feet apart, reaching a depth on the dip of 1050 and 700 feet respectively. On this vein, as on the main Congress lead, the high-grade ore runs uniformly from the surface to present depth.

Congress, Dec. 24, 1901.

*See Illustrations on front page.

No. 2 Incline Shaft, Congress Mine, Congress, Arizona.

Man Power and Its Cost.

Rankine gives the following tahle for the power of a man doing different kinds of work:

	Hours Per Day.	Horse Power.
Raising his own weight up stair or ladder	8	.1320
Hauling up weights with rope, lowering it empty	6	.0545
Lifting weights by hand	6	.0440
Carrying weights up stairs, returning unloaded	6	.0337
Shoveling earth to height of 5 feet 6 inches	10	.0142
Pushing or pulling horizontally	8	.0965
Turning a crank or winch	8	.0820
Working a pump	10	.0600

Assuming .1 H. P. as the power of the average man, then, if lahor can he procured for $1 per day of ten hours, a horse power hour will cost $1; a horse power year, assuming 3000 hours per year, will cost $3000, which is greatly in excess of any other kind of power. Another disadvantage of human power is that it cannot he worked continuously, hut must have long periods for rest and recuperation. It also requires a large amount of space for a small amount of power as compared with other sources of power.

In "The Animal as a Machine," Dr. Thurston gives the thermo-dynamic efficiency of a man as 20%, which is about the same as that of the hest steam engine. In respect to weight per horse power, a man has $\frac{600}{700}$ pounds as compared with the $\frac{1500}{2000}$ pounds of the horse, or the $\frac{50}{100}$ pounds of the hird. Mr. Box gives the power of a man, working ten hours per day on a winch as .072 H. P., on a treadmill as .105 H. P., and on a capstan .084 H. P. If the hours of labor are reduced from ten to four per day, then in the ahove cases the power will he increased to .113, .167 and .134 H. P. respectively, thus showing the large increase of power as the time of lahor is shortened. D. K. Clark says that the average man working on a pump, winch or crane exerts ahout .1 H. P. if the day consists of ten hours, but that he can produce four or five times this amount if the time is shortened.

Solving the Fuel Problem in Arizona Mines.

Written for the MINING AND SCIENTIFIC PRESS by J. H. WOOD.

With the decline in copper values, the fuel problem assumes even greater importance than it already held as a factor in successful mining operations. When operating the Eobie Grande mines, south of Bishee, before the railroad was extended into Sonora, the coke item was a most serious one. Coke which was bought at the Colorado ovens for $3.50 cost us about $12 laid down at the railway terminal. Freighting charges from that point to the smelter—some 40 miles—ranged from $8 to $9.50 per ton, so that by the time the coke reached the smelter its cost had risen from $3.50 to $21 or more.

This almost prohibitive cost was not the only disadvantage in using coke. There were times when the manufacturers could not fill our orders, times when cars were delayed on the railway, times when freighting teams were scarce, as well as when they were stalled en route with several carloads of coke aboard.

Is it any wonder, then, that mine superintendents are ever hopeful of finding in oil an ideal fuel? Every experiment with this end in view is kept in mind and results carefully studied. Much advancement has been made in the use of oil as fuel in various parts of Arizona. At the Congress mine crude oil has been used for years in the roasters. At that mine the non-shipping ore is crushed, plated and concentrated. But as all the values cannot be extracted by this process the tailings are roasted in the oil fuel furnaces before cyaniding. In this operation the tailings are carried, in endless chain buckets, through a series of furnaces or fire boxes, in which the fire consists solely of burning oil.

Another important step forward has just been taken at Globe, Ariz., where the Old Dominion Copper Co., after a month's trial, announces that the experiment of using fuel oil in smelters has been successful. This test has demonstrated that oil is cheaper than wood or coal and can be used with entire satisfaction in smelting work. The use of oil as fuel is to be expanded at the Old Dominion plant so as to extend to the boilers at the mines. To carry out this plan the company will erect storage tanks of 200,000 gallons capacity, and construct a pipe line to convey oil from the smelter to the mines. Only those who have the practical management of Arizona mines on their hands can fully appreciate the difference in results which will follow the general introduction of oil as a cheaper substitute fuel for wood, coke and coal.

Reverting to the Congress mine, it should not be forgotten that the standard gauge steam railway engines in use on the Congress Railway, operating between Congress Junction and Congress, use crude oil as fuel under their boilers. In this case, too, the operation is eminently successful.

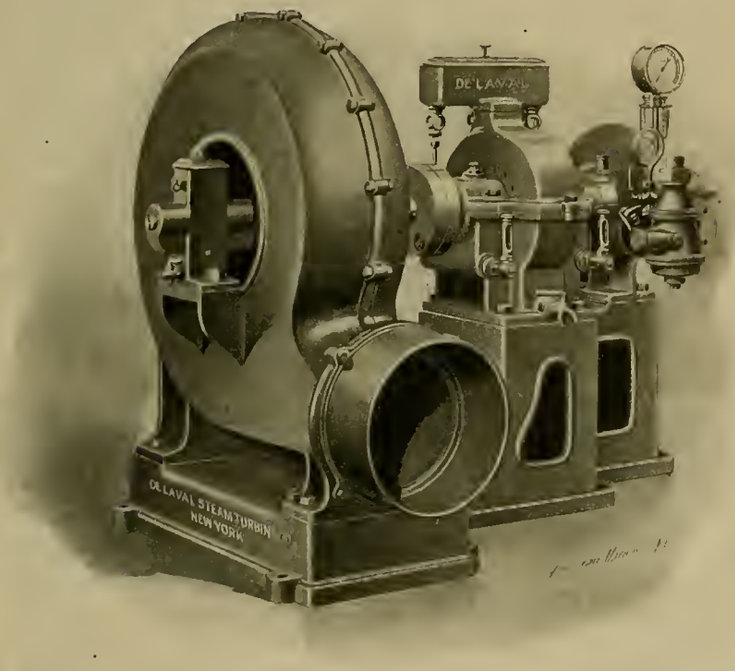
The experiments above cited involve only the use of crude oil, but other tests have been going on with better quality oil. One in particular was conducted with a view to ascertaining whether crude distillate could be used as the motive power in gas and gasoline engines, instead of either gas or high-grade gasoline, at the suggestion of an Arizona operator who found steam plants unsuitable for his operations. In order to make the test on a large and practical scale, a carload of 45° distillate was shipped from the Puente, Cal., refinery to the engine manufacturing company's factory.

The outcome of this test was the erection of distillate engines capable of running almost any kind of mining machinery. Immediately two 30 H. P. engines were installed, one to operate a 10-stamp mill, crusher, vanner, pump, and the other to run an air compressor operating three drills, besides handling all the hoisting from a 500-foot shaft. These engines have been in very successful operation, and on a basis of economy which netted a total saving equivalent to the price of coal. In other words, distillate and engineer cost no more than would have paid an engineer and fireman, thus saving the cost of coal, besides a saving in difference in original cost of plant as compared to a steam plant.

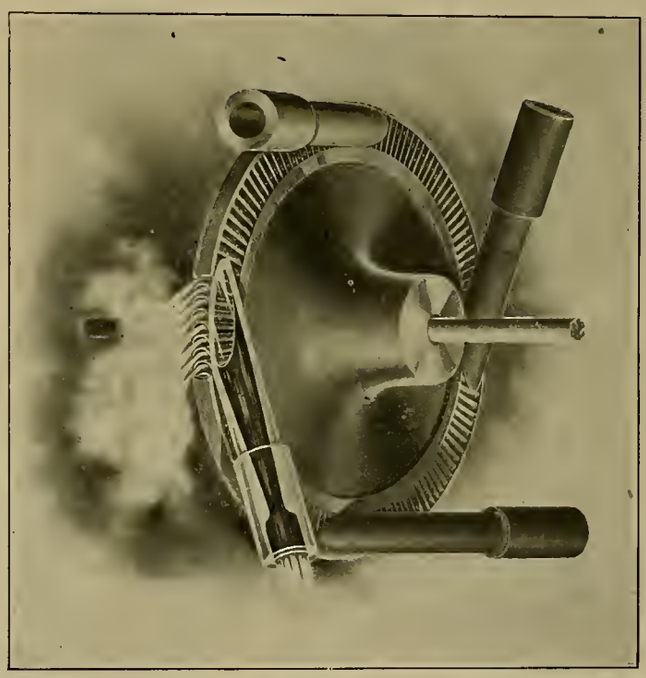
The DeLaval Steam Turbine.

The steam turbine is not a new discovery or based on a new mechanical principle. The first steam motor of which there is a record, that described by Hero of Alexander in 120 B. C., was a reaction steam turbine. It consisted of a spherical vessel mounted on trunions through which steam was admitted to finally issue from openings tangential to the equatorial circle of the sphere. Later, in 1629, Giovani Branca made a steam impact turbine, using a steam jet against the blades of a wheel.

The DeLaval steam turbine, illustrated herewith, embodies the general principles of this type of water wheel. It is simple in construction and direct in making its energy conversion, expanding steam adiabatically and completely. It is a high speed rotary steam engine and is adapted for all purposes where the ordinary type of reciprocating engine is used, and for many other purposes when the conditions are unsuitable for the reciprocating type of engine. The manufacturers say that great uniformity of rotation and close regulation are readily obtained with the engine and that its use is advantageous in connection with electrical machinery, centrifugal pumps, fans and blowers. The high speed and directness of energy conversion decrease the dimensions and weight and simplify construction without loss of efficiency. Its use also admits of an economy in engine foundations, the smaller sizes requiring no special foundation construction whatever. There is an entire absence of shock, it is claimed, in the turbine, and no weight of metal is required in the engine to resist it. A special advantage which the manufacturers claim is the efficiency under partial load which varies very little from the efficiency under full load. The DeLaval Steam Turbine Co. of New York are the manufacturers.



The DeLaval Steam Turbine Blower.



The DeLaval Turbine Wheel and Nozzle.

AN absolute grant of title to mineral lands in the Philippine islands, such as exists under the United States mining laws, is entirely unknown to the old Spanish mining law of that archipelago, which is considered to be in force at the present time. All the so-called titles are concessions or permissions, issued by the Governor-general under the provisions of the royal decree and the regulations thereunder, which concessions continue in full force indefinitely and until terminated by the failure of the concessionary to perform all the prescribed terms and conditions under which he holds his concession. These concessions, for failures of the concessionary to perform the prescribed conditions, may be terminated either by action of the Government, ex-officio, or upon complaint of any person entitled to apply for a mining concession, and who thereby gains a preference right to the granting of a concession to himself of the property against which he makes complaint, and, as all proceedings were purely administrative, the tenure of title was very uncertain and unsatisfactory.

Cyaniding Silver-Bearing Tailings.

Written for the MINING AND SCIENTIFIC PRESS by J. T. TERRY, JR.

The writer as chemist in charge recently worked 2500 tons of low-grade silver-bearing tailings at Amalie, in Kern Co., Cal. The following notes on the work may be of interest:

The values in the tailings existed in the form of silver chloride, sulphide and antimonate and yielded to treatment an extraction of about 80%. The plant comprised five 20-ton capacity leaching vats, a sump tank, a solution tank and a zinc box 16′x18″x18″ divided into seven compartments. The strength of strong solution used was .4%. The consumption of cyanide was six pounds per pound of precipitate recovered. The latter was worth on an average $8 per pound. The consumption of zinc shavings was at the rate of 1 8 pound per pound of precipitate produced. The tailings were handled by means of a scraper, the material being drawn up to the vats and shoveled in through a screen. The leached sand was discharged over the side of the vats and scraped away to a waste dump. Two shovelers and one teamster with scraper were all the laborers required, these being sufficient to discharge and fill a 20-ton vat and remove the treated tailings in ten hours.

Mining Experts.

A mining expert, to be worthy of the name, needs not only that knowledge of mine engineering in its details which the mining engineer has, but also that special and wider knowledge which embraces familiarity with ore deposits in many places and under diverse conditions, as well as knowledge of the business conditions attaching to the industry. To the school training of the engineer must be added that practical training in mining and metallurgy which is obtainable only by personal experience; so far there is common ground for both the engineer and the expert. In addition the expert must have a sufficient knowledge of, and experience in, practical geology to enable him to ascertain the structure immediately surrounding any given ore body, and must also have that inborn, or acquired, business sense which enables him to balance the certain cost of production per unit (under existing conditions) against the probable income per unit, from the venture. He must also be able to put these figures, together with the factors accruing from improved facilities, before his client in a clear, businesslike, and easily understood way. His technical views must be indisputable, while his economic views should be worthy of the greatest consideration, and subject to revision only by those men who are masters of finance in the marketing of the particular metals or ores under consideration.—Canadian Mining Review.

A Complex Vein Formation in Porphyry.

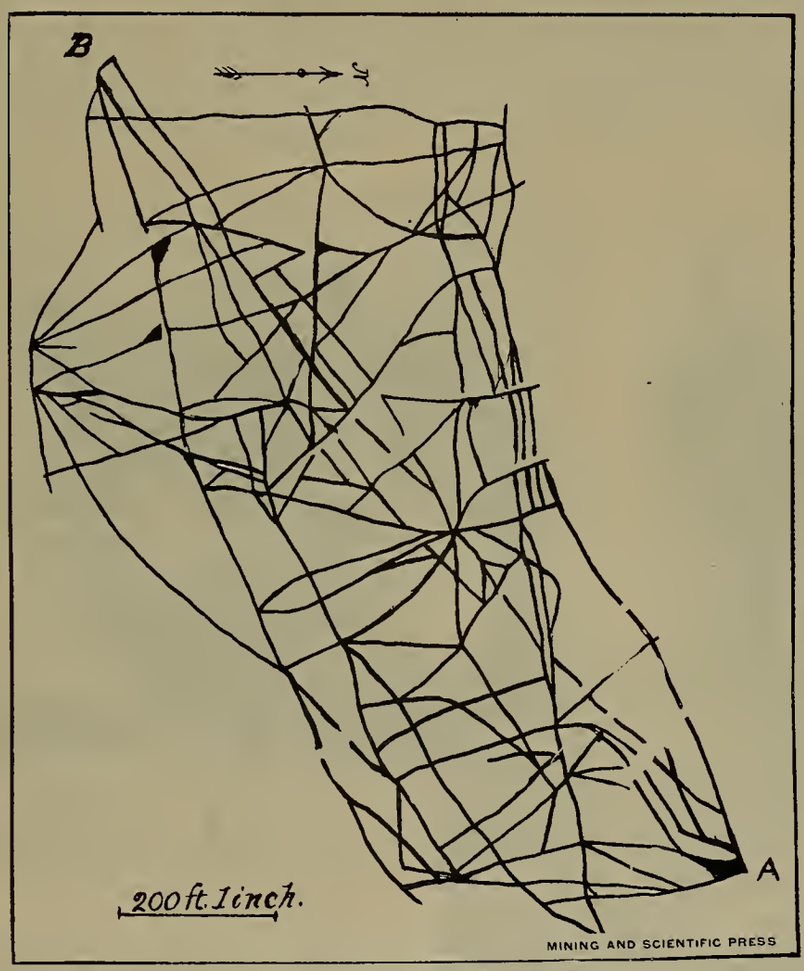
To the Editor:—Noting in the Mining and Scientific Press several extended articles on ore genesis, vein formation, vein enrichments, etc., illustrated by maps, I have been studying the same questions in the field and getting maps so similar, in some details to those referred to, that in parts they are almost identical.

The map presented herewith shows the mineralized quartz veins in a small porphyry dike near Jacksonville, Oregon.

There is no attempt to show all the actual bends and widths, only the location and strike of each vein, its breaks and crossings, as actually traced by survey.

The distance from A to B is nearly 1600 feet. At A the veins pinch and end, at B they come together and pinch to a 4-inch vein.

A few of the veins extend into the slate; the country rock bedding planes vertical, strike N. 20° E.; the quartz veins appear to be vertical or nearly so, varying in width from less than an inch to 30 inches.



Network of Small Quartz Veins in Porphyry Dike.

The lesson I learn from this map, in the light of the excellent articles above referred to, are that this isolated porphyry intrusion in slate, in some places passed above the present level of the slate, in others it did not reach it. Some portions of the slate were surrounded and partly mineralized. When, on cooling, strains from shrinkage became equal to the cohesion of the parts retaining the greatest heat, the line of greatest heat would be the line of least resistance, and along this line of weakness the force of the strain would cause cracks to form. Into these cracks the mineral-carrying waters would find passage, and room for exchange and deposition; leaching the metals from the porphyry, or bringing them up from the depths, as long as it remains hot enough, or the circulating waters retain their solvents.

The order of solution would seem to be in the order of solubility; deposition, the reverse of this; for instance, when iron is all carried off into the cracks, the solvents attack the more resisting metals, and, carrying them to the now formed mineral veins, finding the iron, drops the load in exchange for iron, which it carries farther on. Is not this metasomatic deposition?

On the rapidly cooled parts of this porphyry there was not time for the complete leaching, the silica crystallized, and the metals were deposited in place.

After the first cracks, further shrinkage strains—aided probably by seismic jars—caused a new set of cracks to form, making breaks in the first cracks; and these were themselves broken later. These secondary and tertiary cracks were sometimes wide enough that the mineral waters could not cross them, and deposited their loads at the break, extending laterally and rearwards, mineralizing the bank of the new crack on the side of the flow, thus making what has been described as local enrichment.

The new cracks having been made after one metal was nearly leached out, and another was being leached, they carried mostly the new metal, and only a small part of the metal deposited in the first crack.

In many instances I have sunk on the crossings and find that, almost invariably, there is an upraise, as if the water depositing the quartz found an obstruction, or a confluence, and built up a pillar at the crossing.

All of the veins on the map are, according to indications, more or less gold bearing; assays have proved each one sampled to be so. But this near surface sampling has not disclosed any very rich veins; possibly this porphyry cooled too fast to yield all its metal to the vadose circulation; or, being distributed into so many veins, there was no chance of greater concentration, thus forming a low-grade proposition, with, possibly, a far larger total content than is often found in one rich vein.

Joseph Voyle.

[Without intending more than a suggestion, it would be interesting to know if there are placer deposits that can be definitely connected with the vein system the writer describes. Vein deposits of gold of the kind described above are believed to be the source of the major part of the placer gold mined. The geological history and present topography of the Jacksonville, Oregon, region are such that it would seem possible to trace a connection between lode and placer where it exists. There is a peculiarity about some deposits, that are similar to the one described, as to the distribution of the gold in place that should be taken into account in estimating possible gold contents and in tracing a relationship between lode and placer. It has been frequently observed that the gold is not imbedded in either the quartz or the porphyry as a matrix, but rather in thin irregular plates found between the quartz and the porphyry. What are described as "seam diggings" in California are of this description. Some such deposits are known which were certainly the source of much placer gold.—Ed.]

The Standard Assay Certificate Form.

Written for the Mining and Scientific Press.

The forms that the Denver, Colo., and Los Angeles, Cal., assayers send are for the larger number report forms, which are intended to declare the result of treatment tests of ore. These are not assay certificate forms, strictly speaking, though they report the results of assays made in connection with the tests. These forms are all excellent for the purposes for which they are designed. The standard assay certificate form is not intended as a substitute for such working test report forms at all. These report forms report commercial results on a working scale, which is just what the miner wants when he has a working test made of his ore. The standard assay return form is proposed to be used, not with mill or concentration tests, but to report the assays that are made on the ore preliminary to any test at all. The working test reports show commercial values. Assay return certificates in the ordinary forms used now do not show commercial ore values on the face of the certificates. They merely provide the figures from which, if he know the rules, the miner can make an estimate of the commercial value of his ore. Most miners do not know the rules. The assayers do. The standard assay certificate form suggested by the writer would merely provide a uniform form on which the assayer would indicate the commercial values, and thus save the miner the uncertainties incident to making the estimation himself. Now the assayer, the expert metallurgist and the miner all want to know the composition of the ore and the ultimate values. While the commercial values alone make some suggestions as to commercial treatment tests, the main reliance for selection of such tests for trial is on the composition of the ore as determined by the assay and the ultimate possible values estimated from the composition and prices in the markets. This is also provided for in the suggested standard form.

The forms which the assayers send which have columns headed as follows: No.... Marked.... Gold, ozs.... Silver, ozs.... Lead, %.... Copper, %.... Zinc, %.... Iron, %.... Silica.... Etc. Value.... are the kind of forms the standard assay certificate form suggested is intended to replace. The idea is that when the prospector or miner brings the ore he has discovered and asks the assayer "what there is in it," the report of the assayer should fully show him on the face of the certificate of assay what the ore is worth commercially.

For mill, concentration, cyanide and other working tests there are special forms, and each assayer can most satisfactorily prepare his own forms for such reports. The suggested standard form is not proposed to take the place of all the forms that assayers use, but to substitute one improved common form for the many forms which different assayers use to report precisely the same facts. The writer is inclined to think that if the assayers used some of the forms on trial they would find that their customers would like them.

R. L. D.

U. S. Gold and Silver Production in 1901.

From the preliminary estimates of the Director of the Mint of the gold and silver production in the United States during 1901, there appears to be only a slight gain over the production of 1900. The yield of Alaska fell about $1,000,000. Colorado made a slight gain ln gold, and the other producers were nearly stationary. The yield of silver exceeded the 1900 yield by about 2,000,000 fine ounces. The total number of ounces of fine gold produced is estimated to have been 3,880,578, value $80,218,800, and the number of fine ounces of silver 59,653,788, having a commercial value of $35,792,200, The coinage value of the silver is approximately $77,000,000. Following is the Mint's estimated production by States:

States—	Gold, Value.	Silver, Ounces.
Alabama	$3,900	43
Alaska	6,904,400	5,000
Arizona	4,193,500	2,995,500
California	15,730,700	1,118,333
Colorado	29,000,000	20,833,333
Georgia	144,900	820
Idaho	2,273,900	4,000,000
Maryland	200	1
Michigan	20,000	102,000
Missouri	700	.....
Montana	5,023,300	14,500,000
Nevada	3,000,000	4,000,000
New Mexico	832,800	434,000
North Carolina	65,800	16,558
Oregon	1,777,800	125,000
South Carolina	120.900	316
South Dakota	6,601,800	364,120
Tennessee	200	5
Texas	1,100	447,400
Utah	3,824,300	10,250,000
Virginia	7,400	1,049
Washington	620,200	350,000
Wyoming	62,000	30,000
Totals	$80,209,800	59,573,478
British Klondike	$17,595,400	487,666

Corundum in Montana.

Written for the MINING AND SCIENTIFIC PRESS by J. A EDMAN.

Although corundum has been found for many years at various points in Montana, it has heen chiefly in the placer mines of the upper Missouri river, and as the precious and semi-precious variety of that mineral, known as sapphire. Ever since 1890 the mines at El Dorado Bar, Emerald Bar, French Bar, and other points on the Missouri river, ahout 10 miles east of Helena, have furnished some of this mineral, none of which, however, has heen used as an ahrasive.

In 1895 sapphires were found at Yogo creek, in the western part of Fergus county, and 10 miles west of the town of Utica. In the following year they were traced to a decomposed igneous dike traversing limestone. Mines have heen opened on this dike and have since furnished many valuahle gems and a limited amount of ordinary corundum.

A description of this locality hy W. H. Weed is found in his "Geology of Little Belt Mountains, Montana," at page 454, part 3, of the Twentieth Annual Report, United States Geological Survey.

These discoveries have not supplied any appreciahle amount of corundum suitahle for or ahundant enough for ahrasive purposes, and it was first dur-ing this year that a deposit was found that appears as if it might compete with the mines of North Carolina, which now supply corundum to the market of the United States.

I am indebted to Loverett S. Ropes, E. M., of Belgrade, Mont., for the following description of the mines which are situated at Elk Creek, Gallatin county, about 20 miles south of Belgrade, on the Northern Pacific Railroad:

"The geological formation," he states, "is chiefly gneiss, with hornhlende and garnetiferous slates, and resemhles in many respects some of the corundum deposits of North Carolina. The mineral occurs in a well-defined vein, 4 to 5 feet thick, of which ahout one-half is corundum-hearing. The vein has been traced for over 5000 feet and has heen developed on the surface for a space of 1000 feet."

From specimens in the writer's possession the vein matter appears to he a friahle reddish feldspar, with ahundant hlack mica (biotite-syenite) thickly-studded hy dark-gray corundum crystals frequently over ¼ inch in diameter hy 1 inch long, and generally in well-developed hut externally rough and pitted hexagonal prisms, slightly tapering and with the basal planes well developed. The largest crystal noted is 1½ inch long by 1¼ inch in diameter, and weighs 3½ ounces; specific gravity equals 3.88. The crystals separate easily from the gangue.

The rock sample on hand contains fully 40% corundum. In the vein it is estimated that a width of 2 feet will average 20% corundum, which can be cheaply extracted by crushing and concentration.

The locality of the deposit is sparsely timhered, but water power is availahle, and with facilities for transportation to market it is prohahle that the mines will become a profitahle producer of ahrasive corundum.

Most of this deposit is now owned by the Montana Corundum Co. of Bozeman, Mont., of which Columbus E. McCoy is president and Leverett S. Ropes, formerly of North Carolina, is the superintendent.

Important Decision to Dredging Companies.

Judge Prewett, in the Superior Court of Butte county, California, in the case of A. S. Hendricks vs. John Gale et al., over the rights of the parties to lands hordering on the Feather river at Oroville, which were valuahle for dredging, has rendered a decision, from which the following quotation is made:

This case involves the interpretation of the field notes of the survey of that portion of section 13 lying west of Feather river, in the county of Butte.

It appears from an inspection of the Government plat that it does not conform to the topography of the country as the same now exists. It does, however, conform to the meander line as called for hy the courses and distances in the survey. Whether the course of the river has changed since the survey, or whether the survey was originally erroneous, is now very difficult of ascertainment, and is, moreover, in the opinion of the court, immaterial to the determination of the issues in the case.

It is a fact shown hy the evidence in this case that the meander line is clearly and readily ascertainahle just as called for by the field notes of the survey.

It appears from very obvious mathematical computations that the area called for on the plats and in the patent is fully satisfied if the west boundary of lots 1, 2 and 3 be deemed established hy the meander line. But it appears from a long course of authorities which I find to be practically—and perhaps literally—without conflict that a meander line is not deemed to he the houndary of the adjacent tract where such adjacent tract is hy the field notes hounded by a river or other natural object.

In such case the houndary which calls for the natural ohject prevails over the courses and distances established hy the surveyor, the meander line in such case heing useful merely and only to show the area of the fractional subdivision. This heing the rule, and it heing altogether apparent that the Government survey did, in fact, meander up the left hank of Feather river in front of section 13, the owner of lots 1, 2 and 3 owns to the river, and this whether he thereby gets a much greater acreage than he paid for or not.

He takes to the river not hecause that the patent calls for the tract hetween lots 1, 2 and 3 and the river—for it manifestly does not—but hecause under the rule of construction adopted hy the Supreme Court of the United States, and many inferior courts, it is deemed the fact as a matter of law that lots 1, 2 and 3 reach to the river bank.

It seems to be immaterial in this action whether the tract is dispute was created hy gradual accretions, or whether the Government surveyor, in running the meander line, made a mistake.

In either case the plaintiff would take the land. If an accretion, he manifestly would take it under the law governing that topic. If the meander is erroneous, he takes it hecause the meander line is not the houndary, and the hank of the river prevails as a true houndary.

Geological Society of America Meeting.

The third annual meeting of the Cordilleran Section of the Geological Society of America took place at San Francisco and Berkeley, Cal., during the last two days of Decemher, 1901. The meeting consisted of a series of four sessions, the first of which was held in the council room of the Academy of Sciences in San Francisco.

The organization of the Cordilleran Section of this society marks a period of increased activity in the study of geological science on the Pacific coast. Not since the settlement of the west coast States has so much systematic study of geological prohlems engaged the interest of scientific men. A total of twelve papers were read and discussed at the several sessions of this meeting, all of which pertained to various prohlems of geology and paleontology characteristic of the West. The following is a list of these several papers:

"An Instance of Variahility in Rock Magma," H. W. Turner; "Postpliocene Uplift of the Sierra Nevada," H. W. Turner; "Triassic Reptilia From Northern California," John C. Merriam; "Ore Deposits of Shasta County, Cal.," F. M. Anderson; "Lake Chelan, Washington," H. W. Fairhanks; "Lake Quiheris (extinct), Arizona," W. P. Blake; "Orhicular Gahbro, San Diego County, Cal.," A. C. Lawson; "Geological Section of Coast Ranges," A. C. Lawson; "Petrography of John Day Basin, Oregon," F. C. Calkins; "Graphic Method of Representing Rock Analyses," A. C. Lawson; "Crystallographic Hahits of Colemanite," A. S. Eakle; "Stratigraphy of the Marine Pliocene and Pleistocene of Southern California," Ralph Arnold.

Most of these papers were read or discussed hy their several authors or ahly presented by members of the society. Some of them were of special interest. One of these was the paper hy John C. Merriam on "The Extinct Reptilia of Northern California."

Portions of seven skeletons, representing four or five species of Triassic saurians, were exhihited and compared with those found in other parts of the world. Their discovery is a matter of more than ordinary interest to paleontological science. The genus to which these animals helong has heen called shostosaurus.

A paper on "The Strata of the Coast Ranges," by Prof. A. C. Lawson, disclosed some surprising information. It was stated that the aggregated thickness of sedimentary rocks in the neighhorhood of San Francisco amounted to more than 30,000 feet.

"Neocene Basins of the Klamath Mountains," hy F. M. Anderson, was an attempt to show some of the most salient structural features of the Klamath mountains in California and southern Oregon, including not only their basins, but also their principal ranges. The three chief ranges of the group, extending in a northeasterly direction from the coast, and the drainage hasins intervening and otherwise associated form the main suhject of discussion. Of the two systems of ranges crossing each other nearly at right angles, the northeast and southwest ranges are the older and have exerted a controlling influence over the drainage since their heginning. The principal rivers of the region—the Rogue river, the Klamath and the Trinity—cut transversely across the more nearly north and south ranges, showing them to he younger in age than the lines of drainage followed hy these streams, and accordingly younger in age than the east and west ranges.

The historical development of these drainage basins is shown by the deposits contained in them, and for some of them it antedates the later Cretaceous epochs at least. The earliest drainage of the basin of the Klamath lakes is shown to have heen through the valley of Rogue river and to have heen diverted from that course to the present hy some of the later lava flows from the Cascades. Evidence is cited to show that during the Chico epoch this hasin was not connected with that of the Pitt river or the Sacramento, and it is maintained that its individuality has been kept almost unchanged to the present. As one of the larger streams of the region, therefore, the Klamath is younger in age than either the Trinity or the Rogue river.

The character and magnitude of the deposits of copper ore in the great ore helts of Shasta county were discussed. Three or four types of deposits were described, including some that were said to he the largest of the kind in western North America.

New Rules for Timber.

The Commissioner of the General Land Office, Binger Herman, has issued new instructions in cases of sales and also in cases of "free use" of timher in forest reserves. The rules are given here in part. In all cases of timher sale and "free use" applications the supervisor or ranger in charge of the work (preferahly always the supervisor) goes forth with the applicant to the piece of timher desired. If the timher is such that the forest officer thinks it advisable to cut, they agree on the manner of cutting, including such points as should go into the application. In the case of dead material, only wood standing or down is included. No leaves must he on the trees.

The question to he decided between the person wanting the timher and the supervisor or officer sent to arrange matters are: First, should applicant take all the dead material or only the standing; second, should he take all that is sound enough for fuel; third, should he take that only ahove a certain size, say, 4 inches in diameter; fourth, how should it be marked?

In case of live timher, the following points should go into the application: First, what is to he the smallest diameter; second, will many trees have to he left for seed trees; third, must tops he worked into cordwood, and to what size; fourth, if no cordwood is used, to what diameter will applicant utilize the timher; fifth, must the hrush he piled, and to what extent; sixth, is there any extra work going to he required of the applicant, such as cleaning up doty down stuff, etc.; seventh, how high are the stumps to be; eighth, how is cutting to he done; ninth, can applicant use anything and everything for skids, and should he pay for skidding, corduroy stuff, hridge and road material, etc.; tenth, what precautions as to saving the young and green stuff; eleventh, what camps, road, dams, etc., are going to be involved; twelfth, all trees will he marked and all marked will he cut.

After this agreement is reached, applicant makes his offer of price and signs the application on regular form. The marking and cutting of timher is an important feature of the transaction. All live timher is to he marked near the hase; all dead timher area is marked, and cutting is confined to that particular spot. The measuring of timher and woods will he done according to conditions; generally all is scaled and measured on the skidway or in the pile, according to the Scrihner rule in common use in many localities.

Lots less than $100 in value may he sold without advertising. In all other cases the timher is advertised.

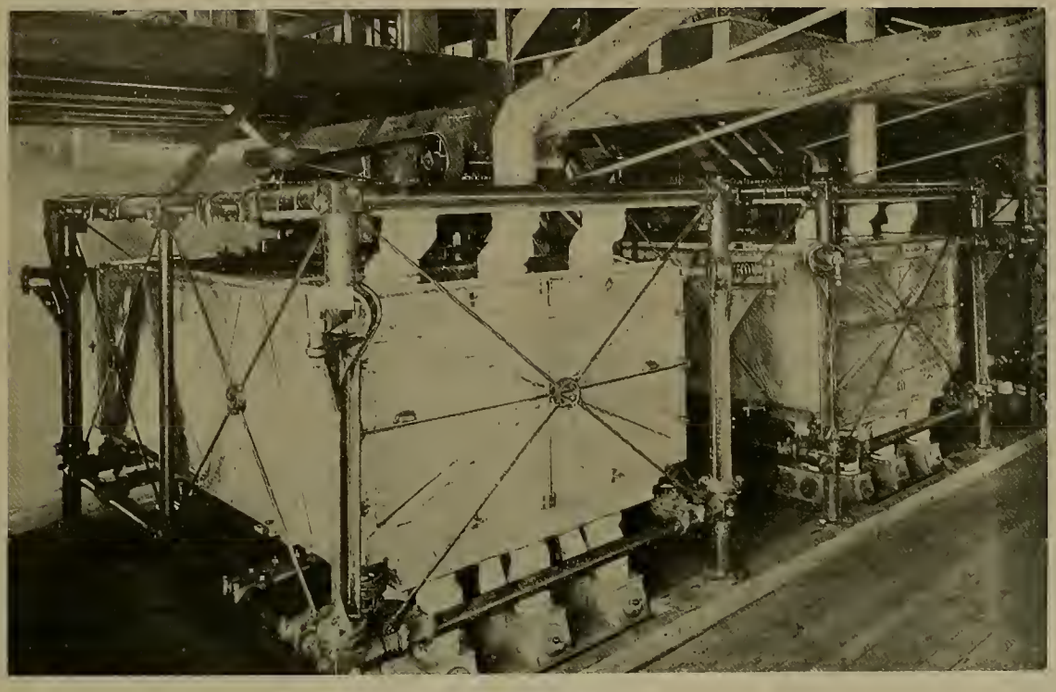
Mineral Experiment Stations.

Senator Gamhle, of South Dakota, has introduced a hill to estahlish in each of the mineral States and Territories a mining experiment station under the supervision of the Secretary of the Treasury. At each station is to he appointed an expert geologist at $3000 per annum, and one chemist at $2000, while an allowance of $5000 is made for estahlishing, equipping and maintaining each of these experiment stations.

It shall be the duty of the geologist and chemist provided for by this act to receive for assay or analysis all rock, cement, clay or other mineral-hearing substance that may be brought to them by any citizen of the United States, and make proper classification or assay of each sample for the purpose of ascertaining the exact amount of gold, cinnahar, silver, copper, wolfram, tin, or any other mineral known for its value, and to furnish at a nominal charge to each depositor a full assay and analysis, showing the quality and quantity of every mineral found in samples submitted. For a period of fifteen days the result of such analysis are to he kept secret from all except the party submitting the samples, after which time the results are to be posted, together with a statement showing the location of the country where the sample was found. When not necessarily engaged at the station the geologist is authorized to explore and examine mineral regions within his jurisdiction, especially in new and undeveloped sections, and make report on such examinations. The bill makes an indefinite appropriation for carrying out its provisions.

New Concentrating Plant.

In the month of December, 1900, the Crown Gold Milling Co. of San Francisco, Cal., through its president, A. J. Harrell, signed a contract with F. A. Flindt and S. W. Mosby, lessees of the May Day mine, Tintic, Utah, by which it agreed to install a "Crown Gold" dry concentrating plant of eighty tons capacity per day. The terms of the contract have been fulfilled, and the accompanying illustrations of the interior of the May Day mill show the machinery in place, so far as it could be photographed from one point of view. The concentrating plant consists of six sizing machines and four shaking tables carrying two belts each.



No. 1 Sizer in Operation.

Concentrators in Operation.

Quoting F. W. Wood, who installed the machinery: "The average May Day concentrates run from 45% to 50% lead, thirty-five ounces silver and about $3 in gold to the ton. The dust which, in ordinary milling operations, would be slimes, carrying the chlorides, is collected in the dust chamber. In the treatment of 100 tons of ore, running from 10% to 12% lead, eight to ten ounces silver and a small percentage in gold, there resulted about ten tons of slimes or dust, showing 20% to 28% lead, nineteen to twenty-one ounces silver; and where the ore assays 50 cents in gold to the ton, we find that the slimes or dust carry from $4 to $6 in the yellow metal, making a good shipping product without further treatment. The plant has been in operation several weeks and its capacity has been found fully up to requirements."

A detailed description of the Crown Gold Company's process was published in the MINING AND SCIENTIFIC PRESS on Aug. 11, 1900.

In perfecting his machines F. W. Wood, the inventor, has spent several years of painstaking study and work, with a view of saving a higher percentage of values from such mineral-carrying ores as are adapted to his process. All parts are fully covered by United States and foreign patents.

The company is composed of well known business men of San Francisco, and its machinery is not for sale, being placed only on a royalty basis, after careful investigation and tests of ore to be handled. Rights to the Republic of Mexico have recently been purchased by E. J. Molera and Lorin B. Doe of San Francisco, who propose to introduce the process in that territory at an early date.

The new home of the company is the three-story brick building Nos. 208–210 First St., San Francisco, Cal., where a 20-ton capacity outfit may be seen in operation. An illustrated catalogue, containing specific information, will be sent upon application.

Substitute for Borax in Soldering.

Among fluxes in use for hard-soldering and brazing borax has hitherto been best, because, unlike other fluxes, it is equally applicable to all cases of brazing and because it surpasses all other materials in dissolving different oxides. The use of the salt would be universal were it not for the fact that during the expulsion of its water of crystallization by heat it intumesces so strongly that it is shifted from the place where it has been put and often falls, together with the spelter mixed with it, into the fire. For this reason an excess of the flux must be used. Much material and labor would be saved if this objectionable property of borax were overcome. A further drawback to its use is that the surfaces to be brazed must be carefully cleaned before the borax is applied, and even contact with greasy or dirty fingers may spoil the surface for brazing.

Friedrich Pich, of Friedrichshagen, Germany, claims that he has overcome the above objections by substituting for borax constituents which form sodium borate during the brazing operation. Such constituents are boric acid and a sodium salt, like sodium carbonate. The action of the mixture, either constituent being in excess or not, is as follows: When the surface to which the mixture has been applied is heated or even if the mixture is applied wet, the sodium carbonate cleans the surface from grease and the like and then remains on the part cleansed. The boric acid tends to intumesce somewhat; but being intimately mixed with the sodium carbonate it is held in place. When the mixture is further heated, carbonic acid is given off and borax is formed. The latter is anhydrous under these conditions and does not intumesce. The dissolution of the oxides from the metals to be brazed is very energetic and rapid. Addition of salt to the mixture enhances the effect by rendering the molten mixture more fluid.

A Large Hydraulic Mine Pipe.

The Gold Pan M. Co. at Breckenridge, Colo., have installed a hydraulic elevator plant involving some novel construction. The company is exploiting a placer deposit extending for some miles in the valley of Blue river, which furnishes the water supply. A ditch 8 feet wide on the bottom, 4 feet deep in the solid and 12 feet wide on the top, having a capacity of 7000 miners' inches, is taken out from the river at a point about 4 miles above the lower portion of the placer, and is brought along the hillside for 2½ miles. The water then enters a pipe line 8000 feet long and 5 feet in diameter, made of steel plate varying from $\frac{3}{16}$ to $\frac{7}{16}$ of an inch in thickness, the whole line containing 1,720,000 pounds or 860 tons of steel.

To build the pipe a pipe-making plant was built at Breckenridge by a subsidiary company (The Gold Pan Engineering & Mine Supply Co.), equipped with pipe making appliances, including lathes, planers, riveters, steam hammers, shears, rolls, complete compressed air and electric plants. Compressed air is transmitted from the workshop to the ditch line, a distance of 8000 feet, and used for rivetting together the pipe in the trench and for caulking it. The pipe is made in lengths of 48 feet, each length weighing from six to seven tons. Each piece is dipped in a standard asphaltum dip mixture in a tank 60 feet long, 6 feet wide and 7 feet deep, holding 100 tons of dipping mixture, being the largest dipping tank in the world. All wooden flumes are painted with a weather resisting mixture. The 5-foot pipe distributes the water to hydraulic elevators and giants which operate under 350 feet head. A total lift of 90 feet is made by the elevators.

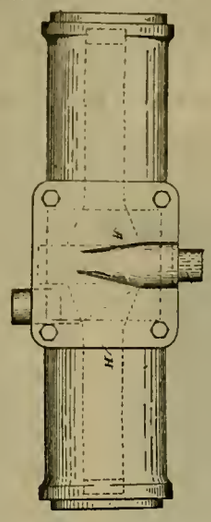
THE first steamship, the British tanker Clam, that ever crossed the Atlantic ocean with steam generated by means of liquid fuel instead of coal has just arrived at Philadelphia. The Clam is fitted with three ordinary return tube boilers. The oil-burning apparatus consists of a steam generator which atomizes the oil and discharges it into the furnaces. A firebrick structure is fitted upon which the oil impinges so as to secure complete combustion. One injector is fitted to each furnace.

Mining and Metallurgical Patents.

Patents Issued December 31, 1901.

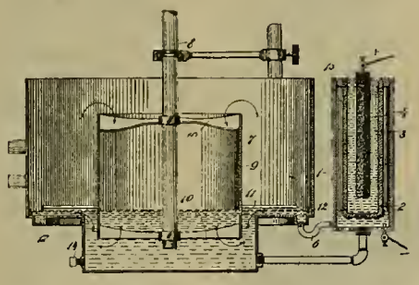
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROCK DRILL.—No. 690,042; Gov. D. Warren, Independence, Colo.



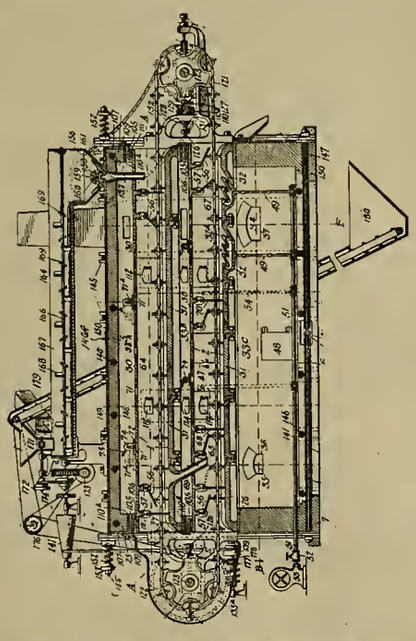
A cylinder, a valve in communication with cylinder, an operating arm carried by valve and adapted to enter cylinder at one side, a piston within cylinder, a shifting plate carried by one side of piston and projecting beyond its periphery, and having a reduced central portion adapted to receive valve-operating arm and cylinder having a longitudinal groove in side adjacent shifting plate and adapted to receive portion projecting beyond piston, whereby shifting plate is prevented from rotating with piston.

APPARATUS FOR TREATING GOLD ORES.—No 690,190; V. P. y Sacio, Yauli, Peru.



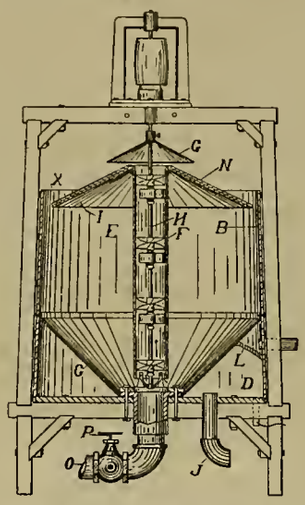
A receptacle having a wide upper portion with an annular collecting channel in its bottom and a reduced lower portion, a stirrer extending into both portions of receptacle, an electrolytic vessel or cell and passages leading from vessel to lower part of reduced portion of receptacle and to collecting channel respectively.

ORE TREATING FURNACE.—No. 689,946; A. M. Beam and H. S. Bailey, Denver, Colo.



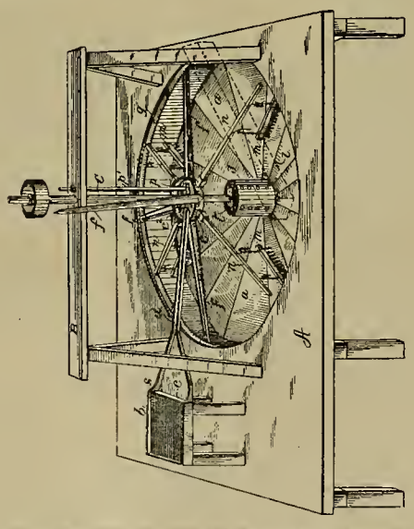
Inclosing walls containing muffles having swinging door partitions at their ends and compartments within one muffle, swinging door partitions arranged to separate one compartment from another and their communication with one another, means for moving position of doors to enlarge one compartment and decrease length of another, means including perforated floor sections, pipes built in walls and a blower attached to pipes for delivering heated air through across perforated sections of floor of muffle, so that air will pass upwardly through ore from its under side, means, including valves, for controlling volume of air admitted, means for admitting air to both sides of muffles, means including flues and a chimney for heating muffle, openings through compartments leading into flues, valves arranged to cover a predetermined number of openings, means including a lever and rod connected to valves and projecting through walls for moving valves to open and close openings and an ore-moving rabbling endless chain.

AGITATING MACHINE FOR CYANIDING.—No. 690,375; G. Rubsch, Jr., Los Angeles, Cal.



An agitating tank, having a conical bottom; a heating chamber surrounding conical bottom of agitating tank; means to heat chamber; a rotary pump, centrally disposed in agitating tank, adapted to take solution from bottom of tank and discharge it above top; a rotary deflector, adapted to distribute solution over a stationary deflector; and a stationary deflector affixed to casing of pump adapted to deflect solution to near edge of agitating tank.

ORE CONCENTRATOR.—No. 690,301; R. R. Lee, Pinos Altos, N. M.

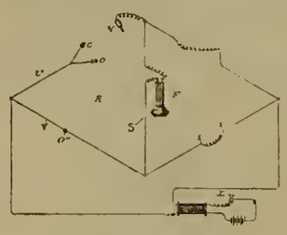


A circular pan, a central vertical rotating shaft carrying a rigidly attached bowl, two sets of radial arms connected to bowl in same horizontal plane, one set being provided with pendent and dragging rubbing devices, and alternate set being constructed as troughs rigid from end to end, but hinged at their inner ends to bowl opposite openings in same and extending to outer periphery of pan.

PROCESS OF MAKING SODIUM AMALGAM.—No. 689,926; E. B. Smart, Florence, Colo.

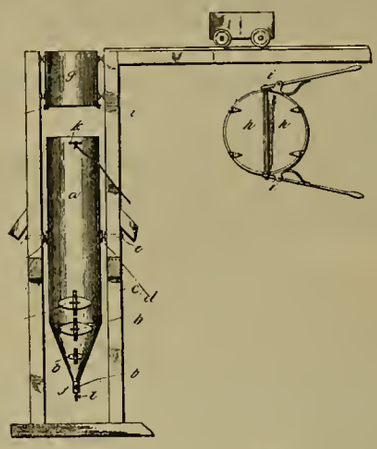
Heating paraffine to a temperature sufficient to melt it and alkali metal, then adding metal to melted paraffine and continuing heat until all metal is melted, the amount of paraffine employed being sufficient to cover metal when both are melted, then adding mercury to melted mixture of paraffine and metal, and then decanting paraffine.

APPARATUS FOR DETECTING AND LOCATING METALLIC ORES, MINERALS, ETC.—No. 689,849; F. H. Brown, Chicago, Ill.



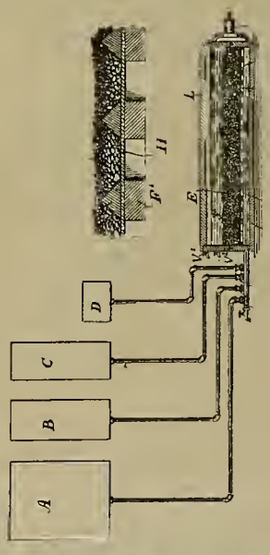
Circuit terminals independent of and freely movable with respect to each other and adapted to be brought into contact with the earth at various and widely separated points to close electric circuits which include earth between such terminals, and means for measuring resistances of earth portions of circuits.

APPARATUS FOR EXTRACTING GOLD AND CONCENTRATING ORES AND METALS.—No. 690,278; W. F. Heathman, Santa Ana, Cal.



A tiltable, elongated water holder, adapted to assume vertical and horizontal positions, and having a wide opening at its upper end and its lower end being tapered or conical and provided with a series of openings arranged one at apex, and others in side at different distances above apex, and an ore or metal receiving box fixed directly over water holder, and provided with means for releasing and allowing discharge of its contents simultaneously.

PROCESS OF TREATING METALLIC ORES.—No. 690,361; S. C. C. Currie, New York, N. Y.



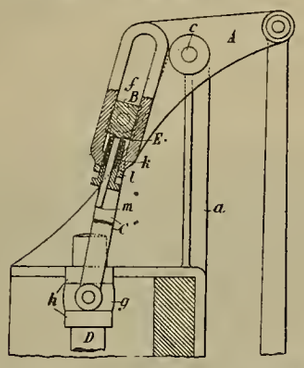
Washing them with water to remove all impurities therefrom, subjecting washed ores to a solution containing chlorine and a hypochlorite, and varying amount of hypochlorite during treatment of ores, so as to maintain resulting solution free from acid.

PROCESS OF EXTRACTING ZINC FROM WASTE PRODUCTS OF ROASTED PYRITES.—No. 690,205; C. Kellner, Vienna, Austria-Hungary.

Consisting in converting zinc compounds therein into sulphides by suitable means, converting sulphite into sulphate by a suitable oxidant, treating sulphate with an alkali metal or alkaline-earth metal chloride,

thereby forming chloride of zinc and sulphate of an alkali metal, removing latter and recovering zinc.

STAMP MILL OR BATTERY.—No. 689,955; W. Fowler and J. D. Ewen, London, England.



A stamp stem, a vibrating lever having two tubular guides or lugs f′ f′, a rod sliding freely in guides and links C connecting the slide bar with stamp stem, axis of tubular guides being arranged on lever to assume different positions in respect to axis of stamp stem.

PROCESS OF DISINTEGRATING AND COMMINUTING MINERALS OR ORES.—No. 689,959; E. L. Graham, Upper Warlingham, England.

First immersing ore without preliminary heating in a solution of sulphuric acid incapable of dissolving it; secondly passing an electric current of sufficient strength to disintegrate ore through solution and finally extracting metal from ore.

The Velocity of Steam.

By W. H. WAKEMAN.

The statement has been made, and evidently believed by some engineers, that if a round hole 1 inch in diameter should be bored in the shell of a tubular boiler, above the water line, it would be impossible to make steam fast enough in that boiler to maintain a working pressure. The size of the boiler was not given when I heard the above statement, except that it meant any boiler in ordinary stationary practice.

As many engineers have never given their attention to such matters, except in a very general way, I have concluded to make a sort of test case of this in order that the truth or falsity of it may be demonstrated so far as it can be by application of well-known principles, or in other words, it will be proved from a theoretical standpoint.

It is evident that our first business is to find how fast steam travels under these conditions, and here is a question on which the doctors seem to disagree, to use a common expression, for its velocity is stated at 900 feet per second by some writers, at 1450 by others, while the highest statement I have read places it at 3500 feet.

I can understand the cause of difference between the two former, but the latter surpasses my comprehension, therefore I leave it as a mystery for somebody else to solve.

It is an axiom that the velocity of steam as it emerges from a hole is due to the pressure behind which forces it out against atmospheric, or other pressure, but just how this pressure affects it is a point for consideration.

The velocity of steam is influenced in the same way that water is, when coming out of an orifice, at least to a certain extent. If we take a U-shaped pipe, both sides of which are 100 feet high, place it in a vertical position and fill it with water, the pressure at the base will be directly in the height of the columns of water, and it may be determined by multiplying the height .434 and $100 \times .434 = 4.34$ pounds. If we now proceed to cut off one side of this pipe at a distance of 58 feet from the top, the pressure under which the water will flow from it, provided the longer part is kept full, is 58% of the full pressure and $43.4 \times 58 = 25.2$ pounds, because it is due to the difference in height between the two sides of pipes.

We may prove this by calculating the pressure due to the height of each and substracting the lower from the higher. Cutting off 58 leaves 42 feet, and $42 \times .434 = 18.2$. Then $43.4 - 18.2 = 25.2$ pounds.

This illustration is introduced to show that in order to use the rule to be explained later on the lower pressure must not be more than 58% of the higher, but it may be any lower pressure without detriment.

Applying this to ordinary conditions where steam is blown into the air at sea level, we find that the lowest boiler pressure to be used is eleven pounds by the gauge, which is determined as follows:

Atmospheric pressure is taken at fifteen pounds and as this is 58% of some number, we may determine what that is by dividing 15 by .58 when the quotient is twenty-six pounds absolute, or eleven pounds by the gauge. Inasmuch as this is the least difference to be allowed it naturally follows that we may raise the boiler pressure as much as we desire without impairing the value of the rule for the velocity. It also follows that the lower pressure may be reduced to any point desirable, therefore if the steam is discharged into a vacuum the rule still holds good.

I may remark here that this does not seem logical, but it is the results of direct experiments and these cannot be disputed.

It is necessary to give the laws which govern the action of falling bodies some attention, as the velocity of water coming out of a pipe, or of steam blown into the air, is determined by the same law which gives velocity to a common ball when dropped from the top of a church steeple. Friction modifies the results in all cases, but does not repudiate the law.

If a weight be dropped from an elevated place, under conditions which prevent friction, it will fall 16.1 feet in one second, but it started from rest, therefore its final velocity must be double its whole travel, or 32.2 feet, as its motion is uniformly accelerated, and this will give it a velocity of 64.4 feet at the end of the next second. At the end of the third it will be 96.6 feet and for the fourth it will be 128.8 feet.

If it falls 16.1 feet during the first second, and its motion is uniformly accelerated, it will fall 32.2 feet during the next with the acceleration due to the first, to which must be added the 16.1 feet due to gravity, making 48.3 feet in all during that second, or 64.4 feet for two seconds, so that by squaring the time in seconds and multiplying by 16.1 the height may be determined.

It follows that if we know the height we can determine the velocity, which is the point of more especial interest in this connection. The rule for this is to find the square root of the height in feet, and multiply by 8. This rule is based on the principles above referred to.

Suppose that we have a vertical pipe of unknown height, full of water, and we wish to know how fast this water will run out through an opening at the bottom. Connecting a gauge to the bottom we note that the pointer indicates 43.4 pounds. Proceeding to multiply this by 2.3 the height is found to be 100 feet.

The square root of 100 is 10, and $8 \times 10 = 80$ feet per second. Study of the foregoing leads to a clear understanding of the rule for the velocity of steam as it is based on the same principles. The steam gauge on a boiler indicates the pressure the same as the gauge on the column of water does, and from this we may determine the height of a column of steam that would produce an equal pressure, if held in a vertical pipe, providing the lower part of it was filled with steam of density equal to that in the upper part of it. If it was practical to erect such a column, the lower part of it would be much more dense, as the weight resting upon it would produce this result, but it is assumed to be of equal density throughout.

Suppose that the absolute pressure is 100 pounds, and we wish to determine the corresponding height of a column of steam 1 inch square. A cubic foot of steam at 100 pounds pressure weighs .2307 pound. If it were to be divided into columns 1 inch square, 1 foot long and set one upon the other it would stand 144 feet high, therefore a column 144 feet high weighs .2307 pound. $144 \div .2307 = 624.18 \times 100 = 62,418$ feet required to weigh 100 pounds.

Put into the form of a rule this reads as follows: Divide 144 by the weight of 1 cubic foot, and multiply the quotient by the given absolute pressure.

The square root of 62,418 is 249.8.

It is not proper to multiply this by 8 as in the case of water, but by 3.6, as experiments have demonstrated this to be correct. Then $249.8 \times 3.6 = 899.28$ feet per second, which fully accounts for the speed of 900 feet mentioned in the first part of this article.

This is the rate before expansion takes place, but the instant the pressure is relieved, it begins to expand to atmospheric pressure at a ratio of 1.624, therefore the velocity is increased at the same rate, and $899.28 \times 1.624 = 1460$ feet, which accounts for the greater speed given by some writers.

When calculating the weight of steam discharged per hour from a boiler there are at least two ways of doing it, one of which is to take the velocity at the expanded rate, and the weight per cubic foot at the expanded pressure, which in this case is fifteen pounds.

The other is to take the velocity due to the pressure, or, in other words, to the height, as already explained, without expansion, and the weight at boiler pressure, which plan will be adopted here.

A round hole 1 inch in diameter, contains .7854 square inch, and the length of the stream of steam coming out in one second is 900 feet, or 10,800 inches.

Then $10,800 \times .7854 \div 1728 = 4.91$ cubic feet per second, or 17,676 cubic feet per hour, which weighs .2307 pound per cubic foot. This makes $17,676 \times .2307 = 4077$ pounds of steam per hour.

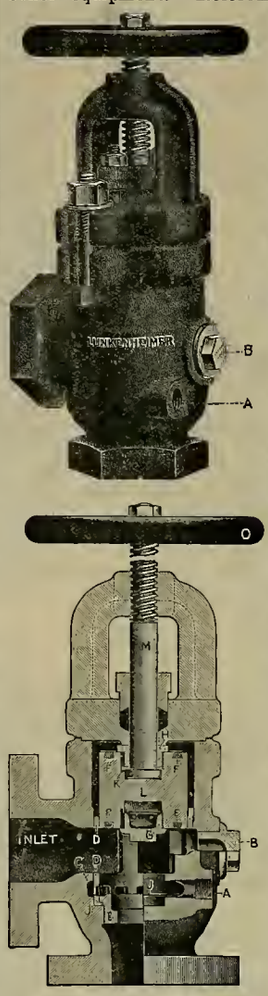
This will not be realized from an ordinary hole drilled in the shell, because it does not give the most efficient form.

If the hole was reamed out from the inside, so as to make a bell-shaped orifice, it would give the best result, but where a straight hole is drilled and nothing more done to it, we cannot expect to get more than .8 of the full capacity, and $4077 \times .8 = 3261$ pounds, or more than 100 H. P. if the feed water is supplied at 100° F.

A tubular boiler 66 inches in diameter with 100 3-inch tubes 15 feet long will supply this steam, if well set where there is a strong draft, using good coal. A smaller boiler can be made to do it, but it is not advisable.—Electricity.

The "Duro" Blow-Off Valve.

Blow-off valves have probably given more trouble than any of the other fittings which are part of boiler equipment. Referring to the illustrations herewith, it will be seen that the general form of this new valve (which has been designated by the trade name "Duro") is quite similar to the iron body angle blow-off valve which has been so extensively used for some years past. The object of this improved valve is to include the valuable points which the old-style valve possessed, and, in addition, a distinctive feature, the novelty of which, the manufacturers say, will at once impress users of its practicability. In old-style blow-off valves the seat is placed so that, as the disc approaches, scale and sediment will tend to collect and cut the bearing surfaces, making the valve leaky. In the "Duro" valve the plug fits snugly in a separate and easily removable bronze casing, which can be readily replaced when worn, and any accumulation of scale on the seat is prevented by a jet of steam blowing over the same.



SECTIONAL VIEW.

Referring to the illustrations, it will be noticed that there is a steam inlet A, and, on the sectional cut, it will be seen that this connects with an annular passage C. The iron body of the valve has a brass casing D, with circular slot J, cut into the side of same just below the level of the seat E. This casing D is held in place in the valve body by the seat ring E screwing over same, both of which are removable at any time for repairs or replacement with new parts. The opening A is connected to the steam part of the boiler and a suitable valve interposed. The object of this steam inlet A is to admit steam to C and J, and, discharging from the latter, blows across the seat, which will clean off any scale or sediment that may have accumulated on it, so that the disc and seat bearing, when in contact, will be perfectly clean.

In operating the "Duro" blow-off valve, when it is desirable to close same, the disc is screwed down in the usual manner. As it approaches the level of the inlet the edge of the disc passing the lower edge of the casing D cuts off a great deal of the flow of water, sediment, etc. At this time the valve in the steam pipe leading to inlet A should be opened and the steam admitted to the annular space C, from whence it passes through slot J and blows off the entire surface of the seat E. In the meantime the disc is being screwed home to the seat, which also cuts off the flow of steam from inlet A as well as the blow-off from the boiler. The valve in the pipe leading to inlet A can be left open at all times, as the disc of the blow-off valve would keep this outlet closed.

This valve is manufactured by the Lunkenheimer Co. of Cincinnati, Ohio.

THE totals of metal production of Colorado, including 1901, are: Gold, $290,032,713; silver, $367,011,581; lead, $106,084,770; copper, $13,723,374; total of the four, $776,852,438.

THE United States Mint at San Francisco, Cal., during the year 1901 coined $81,072,590, the largest annual output in its history.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

At the Ebner mine, in Silver Bow basin, near Juneau, twenty additional stamps are to be installed this spring. During November last all the ore taken from the workings was turned into the stamps for a test run without sorting.

KETCHIKAN.

The Laskawonda G. & C. Co. has been incorporated in South Dakota to operate the Ida, Teekalet and Gold Bluffs claims at Ketchikan, Alaska. The claims are located on a dike nearly 1000 feet wide lying between granite and diorite, and carrying gold and copper in values averaging between $6 and $10 a ton, principally gold. A shaft is to be put down 200 feet, and if values hold up with depth to put on a 100-ton concentrating plant. John Schonbar is Supt.

NOME.

The Nome mining interests of J. Lindberg and E. O. Lindbloom, who have heretofore operated as partners, have been incorporated as the Pioneer M. Co., capital $5,000,000. Some of the stock has been sold to residents of Stockholm and Stredberg, Sweden. The mines which the company will operate include claims on Anvil creek and other creeks at Nome which have proved rich gold producers. New machinery will be installed and a large force of men put to work.

ARIZONA.

COCHISE COUNTY.

Work has been resumed in the Big Fortune shaft of the Bisbee Con. C. Co. at Bisbee. The company will continue work in this shaft and also start sinking a shaft on another claim.——R. Cornell, Supt. of the Pearl G. M. Co., reports that a new tunnel has been started and that the company is taking out a good grade of ore for shipment.

At the Terrible mine, near Cochise, it is reported a 50-ton smelter is to be built. Additional stamps for their stamp mill at Cochise will be installed. S. L. Pearce is manager.

S. Miller, Supt. of the Gold Quartz & Copper Rock mine at Bisbee, states that the tunnel on their property is in about 258 feet and will strike the ledge in 45 or 50 feet more. The company proposes to spend about $20,000 in putting up machinery for hoist and tramway.

GILA COUNTY.

The Bobtail Mines Co. is obtaining a year's working bond at $25,000 on the Miller gold mine, about 18 miles east of Florence. The company is to commence work at once.

MOHAVE COUNTY.

The Treadwell group of mines, near Kingman, has been incorporated as the German-American M. Co., capital $1,500,000. C. F. Schader, general manager of the company, was formerly manager of the Peacock C. Co., near Lavic, San Bernardino county, Cal. O. F. Kuencer of Kingman is a large shareholder of the new corporation.

J. M. Murphy has shipped to the smelter a carload of ore from the Payroll mine, near Chloride, which it is said will average about three ounces gold to the ton, besides a small percentage of lead.

Davis & Harvey, who have been operating the cyanide plant at the Sheeprail mill, near Kingman, have made a final cleanup of 140 pounds of aurocyanides, worth, it is estimated, nearly $12 per pound. The tailings netted them, they claim, something over $4000.

SANTA CRUZ COUNTY.

A. T. Bird of Nogales has let a contract for sinking 100 feet upon the Wandering Jew mine in the Tyndall district. The ledge is said to be more than 200 feet wide and the ores carry silver and copper, with some gold.

CALIFORNIA.

The oil production of 1901 in California is as follows:

Producing Fields.	Wells.	Barrels.
Kern River	184	3,870,000
Los Angeles	1013	1,255,000
Newhall, Santa Paula and Ventura	293	612,000
Puente	34	141,500
Summerland	297	128,000
Coalinga	41	740,000
Whittier	55	512,000
Fullerton and Brea Canyon	59	724,000
McKittrick	22	430,000
Sunset	25	188,500
Midway	2	4,000
Santa Maria	5	7,500
Totals	2040	8,742,500

Average daily total production for one year, 23,000 barrels; approximate daily average production for November and December, 1901, 28,000 barrels; stocks on hand in all fields, December 31, 1901, 1,500,000 barrels.

AMADOR COUNTY.

The Bay State mine, located about 5 miles north of the town of Plymouth, it is reported is to resume operations. It is proposed to take the water out of the shaft and crosscut the west ledge. This property has been idle for two years.

At the Mackenzie mine, near Plymouth, prospecting still continues by the Stockton company and an engine and hoist have recently been put up. The shaft is now down about 85 feet.

BUTTE COUNTY.

The Gold Bank mine of Forbestown will, it is reported, resume operations on a large scale very soon. The prospecting has struck the ledge which was sought and found good ore. Since the mine closed down some months since a number of miners have been tributing and are reported to have been making more than wages.

The Boston & Oroville M. Co. has bought from W. P. Hammon and associates 513 acres of land in the dredging district on the west side of the Feather river, below Oroville, for $78,454.50.

CALAVERAS COUNTY.

C. Coulter of El Dorado and his associates have been developing the Martha and Ritter mines at that place. The three veins are in talc and black slate. A tunnel has been run on the pay shoot and a shaft sunk. The ore, Mr. Coulter says, goes $15 a ton.

Kiser & Nunes' Deep Gulch mine, near Mokelumne Hill, has been bonded at $5000 for three months to Eastern people.

The Monte Cristo, Good Hope and San Bruno mines, near Glencoe, have been bonded to Eastern people. On the Monte Cristo there is a 150-foot tunnel and a 3-foot ledge of milling ore.

The Blue Jay mine at Jesus Maria, which has been bonded to Boston people, will soon be started up. A 1000-foot tunnel will be commenced on the Calaveras river to tap the vein at a great depth. The present workings of the mine are on the summit, on the outcrop of the ledge. J. Gnecco and J. Courtmarsh are the present owners of the mine.

W. Hamilton of San Francisco, owner of the Ennis mine at Jesus Maria, is developing it.

A mill is to be erected at the Salvator mine at Jesus Maria, It is to be operated by water power.

EL DORADO COUNTY.

At the Montezuma mine, on the mother lode at Nashville, prospecting is in progress and the ledge is said to be improving. It is said the 10-stamp mill on the property will be started up.

Six men are employed at the Little Emma copper mine, at Centerville, driving a tunnel on the ledge. Some very rich ore has been mined, which has been sacked for shipment.

The Pilot Hill quartz mine, at Centerville, which has been closed for many years, has been bonded by W. A. Freeman and associates of Auburn. The work of reopening the mine will be begun at once.

Work at the Wilhelm quartz mine, at Centerville, which is being developed by a company of Auburn people, has been temporarily suspended until heavier pumping machinery can be installed.

HUMBOLDT COUNTY.

The gold beach mining property at Gold Bluff, owned by J. Chapman, has been sold to S. Whitlock and daughters of Darby, Conn., H. D. Munson of New Haven, Conn., and others for, it is stated, $50,000. Improvements to cost $50,000 more are projected.

KERN COUNTY.

The California Power Co., which is erecting an electrical plant on the Kern river, above Bakersfield, to supply electricity to Los Angeles and intermediate points, has completed its 2 miles of road over the precipitous bluffs from the intake to the site of the power house at an expense of $12,000. The construction of the 2 miles of tunnel through which the waters of the river will be diverted from the river is under way.

NEVADA COUNTY.

At the Sunflower mine at Grass Valley, under Supt. Ballou, a 5-stamp mill which has been in course of construction has been completed. A Standard concentrator has also been installed. A Sacramento company is operating this mine.

Ehmann & Friant have finished their contract extending the tunnel at the California G. & C. M. Co.'s claim at Spenceville. The tunnel is now in nearly 500 feet.

PLACER COUNTY.

J. E. Fisher, Supt. of the Shady Run quartz mine, reports the work of installing the new 10-stamp mill at the mine will be completed January 15th. This mine has been developed with a 700-foot tunnel, a shaft and numerous crosscuts. There are over 2000 tons of quartz on the dump.

The 20-stamp mill at the Mayflower drift mine, near Forest Hill, has been started on a test run of gravel from the upper lead. F. H. Green of Oakland is president of the company.

PLUMAS COUNTY.

The D. M. Bull mine, near Quincy, it is stated will be opened up at once. A wagon road from American valley to the mine is being built and preparatory work is being done to start sinking a double-compartment shaft.

RIVERSIDE COUNTY.

A. P. Wiley of Yuma, Ariz., is opening some gold quartz claims about 4 miles west of the Colorado river. He is sinking shafts on two claims.

SAN DIEGO COUNTY.

The California King G. M. Co. has done $1000 worth of work on each of the sixteen claims. The mill is in progress of construction and $50,000 has already been spent on it. The company has on hand 455 tons of steel rails with which to lay a 4½-mile track, which will cost $14,000.

SAN MATEO COUNTY.

An oil well near Purissima, on the ranches of Shoults & Wilson, bored by Sallee, Haynes & Guiberson, is reported to have yielded under pump thirty-eight barrels in one day.

SANTA CLARA COUNTY.

The Guadalupe quicksilver mines, near New Almaden, which have not been worked for some years, have been leased by the owners, J. V. Coleman, Isabella May, Cecelia d'Andridge and E. F. Preston, to H. C. Davey for a term of five years. He obligates himself to employ two shifts of not less than ten men each daily, also to make certain repairs. Davey is to receive as compensation a percentage of the quicksilver taken out. Work is to be commenced immediately.

SHASTA COUNTY.

M. W. Herron and A. W. Thierkoff of Redding have bonded the Mountain Lion mine, near Shasta, to F. B. Roberts for one year at $5000. The latter is to work the property and pay a royalty on all ore extracted.

The output of Shasta county mines for 1901 is estimated at $7,100,000, as compared with $5,574,026 in 1900 and $4,661,980 in 1899.

The Black Prince mine, near Igo, is to be developed. W. Robinson, of San Francisco, owner of the property, says a hoist to be run by water power is to be installed immediately and the shaft will be sunk 300 feet deeper.

SIERRA COUNTY.

The Thistle Shaft Co.'s tunnel at Gibsonville is now in about 1300 feet and about 75 feet advance a week is being made. It will require over 5000 feet of tunnel to strike the pay channel.

J. Brock and his co-owners in the Swansea mine at Chipps Flat have resumed work on their tunnel.

SISKIYOU COUNTY.

The Quigley ranch at Oro Fino has been bonded to a company for dredging. A drilling plant for prospecting is to be put on the ground very soon. D. Jones of Oro Fino, representing the company, has made arrangements to bond all the land along Oro Fino creek to Scott river for dredging.

The output of Siskiyou county mines in 1901 is estimated at $1,500,000, as compared with $1,010,383 in 1900.

There is very little water in the streams at Henley, and no mills are running owing to the cold weather, but extensive development work is being done in the Jillson, Gold Eagle, Wabana, Tyrer, La-Flesh, Mt. Vernon, Tiger and other smaller prospects.

SONOMA COUNTY.

The title to the Socrates quicksilver mine, in the northern part of Sonoma county, has been established by a court judgment giving F. A. Huntington 962½ feet of the mine, the Carr Realty Co. 750 feet, John Lloyd 150 feet and W. H. Troop 200 feet.

TRINITY COUNTY.

The output of Trinity county mines in 1901 is estimated at $1,050,000, as compared with $698,669 in 1900.

At the Fairview quartz mine at Minersville a drift has been run on the ledge 300 feet, showing it to be over 3 feet wide and rich in free gold. At present the mine is under bond to the Altoona Quicksilver M. Co.

TUOLUMNE COUNTY.

At the New Era mine, near Carters, owned by C. A. Holland, W. T. Carter, E. A. Wiltsee and A. Hines, the shaft is now down 210 feet. The face of the 200-foot level is in good ore, 4 feet wide, showing fine gold. It is believed to be the same shoot that was drifted upon in the 100-foot level for 150 feet. The worked in the 10-stamp mill upon the property averaged $10 to the ton.

A. C. Morison, Supt., has started men at work on the Atlas mine, Tuttlotown. The old shaft is being cleaned out and is to be carried down from the present depth of 120 feet to 600 feet.

F. P. Price of Big Oak Flat has sold the Lone Star mine in the Big Oak Flat district to M. J. Reid of San Francisco.

The Stanislaus Dredging Co. has sold to the California & Alaska G. D. Co. 250 acres of placer mining ground in Stanislaus river, near Robinson's Ferry.

The Good Return M. Co., an Eastern corporation, owns 120 acres of placer gravel on the Stanislaus river, near Columbia. It is reported that development work will soon commence. The river bed is believed to be especially rich at that point.

YUBA COUNTY.

The Boston & Oroville M. Co. has bought 2000 acres of gold dredging ground on the south side of the Yuba river, a few miles east of Marysville. Dredging, it is stated, will be commenced about March 15 of this year.

COLORADO.

The production of metal values during 1901 in Colorado is as follows:

Gold	$26,593,230
Silver	10,657,984
Lead	6,557,182
Copper	1,426,390
Total	$45,201,786

Zinc, iron, manganese, bismuth and tungsten are minor productions which would increase the total.

CHAFFEE COUNTY.

Near Granite the Cache Creek placer, F. O. Harvey manager, was worked on an extended scale during 1901. Mr. Harvey stated that the washings had been over 1,000,000 cubic yards of ground, covering a space of 140,000 square yards. He states work commenced April 25 and closed Nov. 15, and that an average of seventy men were employed at wages from $2.50 to $3 25 per day, and that the cost of washing the ground was 4½ cents per cubic yard.

The Eclipse mine at Monarch is being reopened. Recently Cripple Creek and Monarch people took a bond on the property at a nominal figure with a view of treating the vast deposits of low-grade silver-lead ore already blocked out. It is estimated that there are 100,000 tons, containing about $10 per ton. Two of the old dumps will run over $5 per ton. A 50-ton mill has been bought to treat this ore. It can be so cheaply handled that it is believed it will be profitable at less than $6 per ton.

CLEAR CREEK COUNTY.

At the Centennial mine, at Georgetown, on the sixth level a body of smelting ore going from $60 to $70 is reported. On the fifth level another large body is coming in. T. A. Watson of Boston, Mass., has been inspecting the property in the interest of the company that has been operating it the past year.

At the Kelley tunnel, at Georgetown, during December, the face was pushed ahead 40 feet and has cut the fifth lode since starting. Drifting on this lode will be commenced as soon as the main face is advanced past it.

The Yankee Con. M. Co. at Yankee has opened an 18-inch vein in the 250-foot level of the Faust mine that shows values of $145 in gold to the ton and strong traces of iridium, one of the platinum group. Capt. H. I. Seeman of Denver, president of the company, has returned to the mine.

DOLORES COUNTY.

The United Rico Mines Co. has been organized at Denver, to absorb and operate nearly every mine in the Rico district. The capital is $3,000,000 and represents present market values of the properties, it is stated. The officers are: President, W. N. McKelvey; vice-presidents, D. H. Moffat and S. Newhouse; secretary and treasurer, A. B. Roeder. P. S. Rider of Rico will be Supt. of the entire property. Among the mines included are the Enterprise, Rico-Aspen, Swansea, Rico Townsite & Milling Co., Atlantic Cable, Rico Mines Co., including the Rico smelter, of a capacity of 150 tons a day, and mill of 100 tons capacity; the Grand View, New Years, Hope group, the Rico Mines Co. properties composing the Rico Mines Co., a 150-ton smelter and a 100-ton mill; the Grand View group, the New Year group, the Hope & Cross group and other minor properties. In addition are the Lexington, Syndicate and Onomo Tunnel companies. The company also acquires the

holdings of the Grand View Coal Co., consisting of 320 acres of coal land 5 miles north of Rico. The office of the company will be in Denver.

EL PASO COUNTY.

The Portland mill at Colorado City, built by the Portland G. M. Co., is nearly completed and expected to start in full operation hy March 1.

It is expected that the new Telluride Reduction Co.'s bromide plant, which is heing erected in Colorado City, will be in operation hy April 1.

GUNNISON COUNTY.

The Patriot M. & M. Co. has been incorporated at Denver; W. M. Phillips, J. R. Schermerhorn, Jr., and J. C. Butler, capital of $500,000, to operate the Graham and New York lodes near Marble. The ore lodes are claimed to range in value from $5 per ton upwards.

HINSDALE COUNTY.

Late strikes made in the Golden Fleece property, near Lake City, are reported as improving with development. The ore, it is claimed, will run $20,000 in carload lots, the first carload shipment returns received heing $21,000. The ore carries tellurium. The vein was found in the tunnel, about 3100 feet from the mouth, and about 400 feet of work has heen accomplished since the strike was first made. The vein averages between 6 and 7 feet in width. The Golden Fleece property is equipped with a mill of 50-ton capacity.

The Ute and Ulay property at Lake City has installed a plant of machinery, including a 6-drill compressor.

LAKE COUNTY.

Leadville production for 1901 is: Gold, $1,749,858.76; silver, $3,976,053.71; lead, $2,370,646.89; copper, $357,420.84; zinc, $565,458.40; manganese, $87,059.30; hismuth, $17,000.

The zinc production of Leadville for the year was more than 36,000 tons, the greater portion of which was shipped to Europe.

At the Crown Point shaft, at Leadville, now over 800 feet down, the indications are said to he good. A plant of machinery is heing installed preparatory to pushing the shaft deeper.

A rich strike is reported made on the Pay Streak mine at Leadville. The rock carries gold, silver and lead and is said to run $180 to the ton. It was found about 2 feet from the surface.

PARK COUNTY.

The carload shipments of ore to smelters from Alma mines for 1901 were 147, against 123 for 1900. Gold from placer workings is estimated at $150,000.

SAGUACHE COUNTY.

The total output of gold for 1901 amounts to $90,000, which, with copper and other by-products added, runs up the production of the district to $100,000. The Independent mine is stated to have made two-thirds of the gold output.

SAN MIGUEL COUNTY.

The mineral product of this county for 1901 from the different mines is as follows:

Smuggler-Union	$850,000
Tomboy	815,000
Liherty Bell	610,000
Carriheau-Montezuma	150,000
Butterfly-Terrihle	110,000
Ophir Con	65,000
Alta	45,000
Milwaukee-Ophir	40,000
Menona	25,000
San Bernardo	57,000
Gold King	55,000
Peck Cyanide Plant	55,000
Miscellaneous shipments	125,000
Total	$3,002,000

The Menona Co., at Telluride, has had its mill remodeled and improved, crushers raised and reset, ore hins enlarged, a new electric motor installed and a 30 H. P. hoiler added for heating purposes and drying of concentrates. The mine has been developed and considerable new hodies of ore opened up. Ten stamps in the mill have been operated. In the spring it will be operated on a more extensive scale. R. W. Davis is Supt.

SUMMIT COUNTY.

Summit county's output for 1901 is as follows:

Gold from placers	$200,000
Gold from ores	300,250
Silver	200,025
Lead	179,830
Copper	10,800
Total	$890,905

TELLER COUNTY.

The Nahoh Co., during the past week, has started work on the Lookout Boy claim at Cripple Creek, and are at work sinking the shaft to 100 feet depth.

The Cripple Creek M. Co. has taken a two years' lease on the main workings of the Independence Con. Co., the Hull City placer at Cripple Creek. According to the terms of the lease the shaft is to be put down 400 feet during the first year. The shaft is down 800 feet.

The Cripple Creek & Colorado G. M. Co., which owns the Rittenhouse mine at Cripple Creek, will at once install over shaft A, the main workings of the company, a $30,000 equipment. Sinking is to be resumed in this shaft, and 1000 feet of work is planned without a stop. The shaft is now down about 500 feet.

Decemher tonnage output of Cripple Creek mines is estimated at 56,000, compared with 54,500 tons in March and 54,510 in October, which months were each in turn the holder of the record. March values were computed at $2,322,000, those of Octoher at $2,253,340, while the Decemher figure was about $2,500,000.

The Findley G. M. Co. has hought the Mountain Beauty fractional claim, containing ahout an acre of ground, at Cripple Creek, from the Mountain Beauty Co. for $50,000, the former company receiving $30,000 royalties now in court.

Lyon & Strickland, working the Elkton dump at Cripple Creek, since starting have shipped fourteen carloads of ore, averaging $30 to the ton in gold. The settling tanks are now in operation, and all the rock that is sorted is first run through a washer, and samples of the slimes indicate that they are worth $60 to the ton in gold. So far, for every six tons of rock handled, they have made one ton of ore.

IDAHO.

BOISE COUNTY.

G. Huppertz, foreman of the Washington mine, near Idaho City, states that the mine, of which C. Balhach is owner, has closed down for the winter owing entirely to lack of fuel. The mine will fill with water, making ahout $800 expense to pump out in the spring, hut this will be cheaper than pumping through the winter with green wood as fuel.

R. Winters, general manager of the Boston & Idaho G. D. Co. of Idaho City, states that his company is preparing to construct an additional dredger for its property early in the spring.

ELMORE COUNTY.

The Ella Hill G. M. Co., owning claims in Elmore county, has been incorporated. It is the intention to develop the properties, starting at an early date. The incorporators are H. A. Smith, A. L. Morris, F. Stauffer, E. A. Wilson, J. W. Burton, A. W. Gallagher and B. T. Cannon of Salt Lake City, Utah, where the principal office is located.

IDAHO COUNTY.

M. Hogan, manager of the Dixie mine at Dixie, during the past six months has crosscut the main vein at a depth of 300 feet with a 500-foot tunnel. The ore which has heen struck is the same as that in the Ajax property adjoining. The Hogan Bros. expect to put in a 20-stamp mill in the spring.

T. Johnson reports that the Henry Clews Co. of New York city, which recently bought the Banner mine at Florence, is putting in a 50-ton milling plant and that twenty-five men are now employed.

M. O. Reed, manager of the Mineral World mine, in the Seven Devils district, near Landore, has started a new tunnel on the 400-foot level. Assays of the ore, he claims, show 13.5% copper and $6.34 in gold and silver.

KOOTENAI COUNTY.

A 20-drill compressor and a concentrator are to he installed on the Continental mine, near Port Hill, hefore spring, according to A. Klockmann of Spokane, Wash., resident director of the Idaho-Continental M. Co., which owns the property. He states that there is 22 feet of concentrating galena ore in the lower tunnel that will go $26 per ton.

LEMHI COUNTY.

P. H. Clark of Nicholia has sold three claims in Spring Mountain mining district to W. H. Tibhals and associates of Salt Lake City, Utah. Mr. Tibhals says he found satisfactory showing of ore in the claims that yielded from 21% to 29.7% copper, 15 to 40 ounces silver and $1.40 gold per ton.

OWYHEE COUNTY.

The War Eagle, or Sinker tunnel, at Silver City, on Jan. 1, 1902, had reached a point 5930 feet from its mouth, with 280 feet more to run to bring it to a point beneath the collar of the old Elmore shaft. The pitch of the vein not being definitely known it cannot be told at just what further distance the tunnel will cut the ledge.

SHOSHONE COUNTY.

A 6-foot ledge has heen struck in the lower tunnel at the Copper King mine, near Mullan. The vein matter is banded, carrying hromide of copper, red oxide and pyrites.

MICHIGAN.

HOUGHTON COUNTY.

The output of copper from the Lake Superior district in 1901 is placed at 170,000,000 pounds, which figures hreak all previous records. The output hy mines is divided as follows:

Mines.	Pounds.
Calumet & Hecla	90,000,000
Tamarack	22,000,000
Quincy	20,200,000
Osceola	15,000,000
Wolverine	5,000,000
Atlantic	4,800,000
Franklin	4,000,000
Baltic	3,000,000
Isle Royale	2,500,000
Centennial	1,500,000

Calumet & Hecla and Quincy have surpassed in point of output any previous year.

MISSOURI.

The output of 1901 in the Missouri-Kansas zinc and lead region is almost $8,000,000. It was $20,454 less than in 1900, despite lower zinc prices. The total value of the zinc sold was $6,353,952, or $230,337 less than last year. The lead value was $1,617,699, or $209,883 more than last year. The lead sales of 1901 were the most remarkahle features of the year. This district was founded on the lead output, before sulphide of zinc was known to he valuahle; yet this year exceeds any previous year in the output of lead. It also leads any previous year in the output of zinc.

MONTANA.

U. S. Assayer B. H. Tatem, in his estimate to Wells, Fargo & Co. for the mineral production of Montana for 1901, places gold at 243,000 fine ounces, valued at $5,021,810; silver, 14.250,000 fine ounces, valued at about $8,550,000; copper, 250,000,000 pounds, valued at $40,750,000; lead, 10,000,000 pounds, valued at $400,000.

FERGUS COUNTY.

The shaft on the Big Six group of claims in the Gilt Edge district is down 100 feet and crosscutting from the hottom has been started. The group comprises five claims and was honded at $20,000 by Kendall & Co. in June, and since that time much prospecting and exploitation has been accomplished with very satisfactory results. The ore in the shaft is of the same general character as that of the Whisky Gulch mines, but is somewhat mixed with the lime formation and is rather low grade.

A new hond has heen given on the Mammoth group, north of the Great Northern M. & D. Co.'s properties at Gilt Edge. An incline shaft is heing sunk in the upper tunnel on the Mammoth claim. This tunnel, which is in the hill about 180 feet, is all in ore for the last 30 feet. This ore is all a high grade of cyanide ore, from which mill tests have recovered a little more than $10 per ton. The new hond on the group is held hy John Fitzpatrick of Meagher county, and it is reported that a milling plant will he erected on the group in the spring.

A strike is reported made in the Ahhey claim in the North Moccasins, owned by the Abbey G. M. & M. & Dev. Co. of Spokane, Wash., a rich hody of ore having been found at a depth of 125 feet from the surface. Assays run from $2.40 to $21.60 per ton gold. A mill is projected to be be built soon. F. S. Akley is Supt.

The Waldorf-Draper group, near Kendall, has heen developed by C. Ridell and fifteen men under the direction of A. S. Wright and A. H. S. Bird, with a view to operating the property. It is stated that there is sufficient ore in sight on the Santiago claim to guarantee the erection of a mill.

FLATHEAD COUNTY.

At the Snowshoe mine, near Lihhy, owned hy the Rustler M. Co. of Spokane, Wash., preparations are heing made to sink the 500-foot three-compartment shaft by contract. The telephone and electric light systems have been put in repair and preparations made for winter's work. D. P. Bowers is manager.

SILVER BOW COUNTY.

The new smelter of the Amalgamated C. Co., at Anaconda, work on which was started on June 18, 1900, is now practically completed, and has gone into commission. To huild the works more than 10,000 carloads of material were used. Of these 1000 carloads were of hrick. Twenty million feet of lumber were used in the huildings and 5,000,000 more in the 7 miles of flume huilt to give the plant a water supply. This flume delivers 50,000 gallons a minute into the tanks. Fifty thousand cuhic yards of masonry were constructed in the work and more than 250,000 yards of earth were excavated for foundations. The site of the new plant covers 300 acres, of which seven acres are covered hy the concentrator building alone. To construct the hins at the reverberatory building alone more than 7,000,000 feet of lumher were used. The new works will have a capacity for treating 5000 tons of ore a day. Nearly 900 men have heen employed almost daily in construction since the first earth was turned June 18, 1900. The building of this plant is said to be the largest work of the kind ever completed within such a brief period. G. D. Case of Copper Hill, Tenn., has been appointed general superintendent of the new smelter.

The strike of copper-silver ore in the Edith May mine at Butte is now helieved more extensive than at first supposed. The shaft is down 40 feet and drifting started in the vein with neither wall in sight. The mine is owned hy G. H. Casey and P. J. Brophy of Butte, and is leased to T. D. Heine, J. Newton, J. Cummings, G. T. Van Wart and J. White, also of Butte. The lessees propose to equip the property with hoisting machinery.

The shaft on the Sinbad claim in Butte is down 600 feet, and it is the intention of M. Genzherger and the Largey estate, the operatiors to continue to 700 feet The rock through which the shaft is heing deepened is very hard. It is stated that more than $50,000 has already been expended in the work.

NEVADA.

LYON COUNTY.

The Nevada Reduction works at Dayton have started up on Tonopah ore. The entire amount, it is stated, will exceed 300 carloads.

The Butters Cyanide Co., near Dayton, expects to handle 200 tons of tailings a day, 6000 tons a month, or 72,000 a year. At this rate over three years work will be required to dispose of the pile, which contains, it is estimated, a quarter of a million tons.

NYE COUNTY.

D. B. Lowe has taken an option on a group of nine claims at Tonopah owned by D. F. McCarthy. This group adjoins the Gold Hill and G. & H. mines.

Brougher Bros. & Co. are at present drifting from the 120-foot level on the Gold Hill property at Tonopah, where they have opened a large vein of shipping ore.

Discussing results that have heen achieved by the lessees on the Mizpah lode, owned hy the Tonopah M. Co. at Tonopah, Manager Oddie, who was one of the original owners of the property, said that one of them had netted as much as $700,000, while those interested in the O'Meara lease will have divided $500,000 hy the time their entire output shall have heen sold.

The Golden Anchor M. Co. has been incorporated at Salt Lake City, Utah, capital $500,000. D. S. Truman is president and G. A. Land secretary and treasurer. The company owns the Golden Anchor mine at Tonopah.

WASHOE COUNTY.

The Colorado-Nevada M. Co., of Cripple Creek, Colo., has hought eighty acres of land adjoining the Bell mine at Reno, and it is stated intend to start at once to open up the mine, putting in a plant of hoisting machinery. The officers of the company are: T. A. Morath, president; J. L. Middlaugh, secretary, and R. R. Arnold, manager.

The installing of the machinery of the Reno Star mill has begun. It will he a leaching plant with a capacity of twenty tons a day. A larger mill would have heen put in, but uncertainty as to the character of the ore below water level made it inexpedient. There is enough ore on the dumps to keep a mill running steadily for several months. It is expected to have the plant in operation hy the middle of February.

WHITE PINE COUNTY.

The Ely M. & M. Co. of Salt Lake City, Utah, owning the Ely mine at Ely, has made the last payment of $10,000. The mine is said to be looking well.

NEW MEXICO.

EDDY COUNTY.

This county is said to he having a copper excitement. Claims are being staked in the Guadalupe mountains, most of the new locations heing made in the Devil's Den district, near the head of Dark canyon, near McMillan. Assays of the ore are said to run from 20% to 55% in copper, with a trace of gold. A numher of Fort Worth, Tex., people are interested in the claims 60 miles north of Carlshad.

OREGON.

BAKER COUNTY.

The Virtue mine at Baker City has made a cleanup of over $60,000 for Decemher, the largest amount by half that has ever heen taken from the mine in any month since its discovery in 1864. It is owned now hy a Montreal company. The present manager, A. Buckhee, discovered a pay streak in some of the old surface workings and the mine has paid well for

several months. Arrangements are being made to pump out the water from the lower workings.

At the Concord mine at Lawton, J. H. Robbins of Sumpter, president, a strike of 4 feet of $70 free milling gold ore has been made in the surface of the Blaine drift at a depth of 600 feet.

The Golden Reward M. Co. has bought the King Solomon tunnel at the foot of Baisley-Elkhorn mountain, near Sumpter. This tunnel will be enlarged to 7x8 in the clear, timbered with square sets of sawed timbers, and will be driven 3000 feet under the mountain, crosscutting 15 known quartz ledges. It will tap the Lillian group and the group recently bought by C. C. Nepple at 2000 feet vertical depth.

Recent estimates show that the Standard G. & S. M. Co. has expended on its property near Quartzburg over $20,000 on improvements and development. A large and well-defined vein has been exposed containing gold, cobalt and copper. It is said there are 1000 tons of ore on the dump that will average nearly $100 to the ton. The smelter will have a capacity of about twenty-five tons daily.

It is estimated that about 2000 men are regularly employed in the mines of Baker and Grant counties at an average daily wage of $3, and that within three or four more months 500 to 1000 more men will be at work. Eleven stamp mills, with 190 stamps, are in operation, and the number of stamps in these mills may in some instances be doubled in spring. Seven new mills will be erected for several mines that will soon be added to the list of producers.

The machinery for the mill and cyanide plant at the Flagstaff mine, near Baker City, is put in place. Supt. McLain says the new plant will begin operations by Jan. 15.

It is stated that for the month of December one Baker county mine produced $91,000 and four others $46,000, $60,000, $30,000 and $20,000, making a grand total for the month just closed of $247,000.

GRANT COUNTY.

It is reported that a strike has been made on the Red Boy mine, near Granite, on the Monarch-Red Boy ledge, which averages over $100 to the ton.

JACKSON COUNTY.

The quartz property recently located by Perkins & Pike in the Dry Diggings district is being found more extended and carrying larger values as it is further developed. Its width first stated at 200 feet has been found much greater. A shaft being sunk now down 10 feet opens ore which assays $9 per ton. A mill test of the lower grade rock gave returns of about $1.50 in gold, besides good values in concentrates. The ore is soft and can be mined and milled cheaply.

The Behrman property of the Meadows district, near Jacksonville, comprising 800 acres of cinnabar bearing claims which has been under bond by English people for several months, it is reported, is to be bought by them for $400,000. They will put in an extensive working plant.

At the Mayfield cinnabar mine, in the Meadows district, near Jacksonville, a strike is reported made on the 200-foot level of a body of high-grade cinnabar. The Mayfield is one of the cinnabar claims of the Rogue River Quicksilver M. Co., which is operating in the Meadows. From a small hole 10 feet in depth and 4 feet across in the Mayfield $4000 worth of cinnabar was removed a short time since. The company has put in a complete modern roasting plant and equipment. Besides the claims of the Rogue River Quicksilver M. Co., there are a dozen or more other claims in the district being developed.

Shook & Stanley have started sinking on the ledge of the Deerhorn mine, near Jacksonville, from the level of their 90-foot tunnel. The ore carries gold, copper and silver. Much of it is free-milling gold ore, but the best of it is base.

The Beaver Creek M. Co., near Jacksonville, is extending the ditch from North Beaver creek to their old placer ground, 3 miles below. Coleman & Starkey have the contract to construct this ditch at $2 per rod. It is to be 2 feet wide at bottom, 3 feet at the top and 18 inches deep. This illustrates about the average cost of running placer ditches in this region in ground comparatively free of rock.

G. F. Fendall has struck some good gravel on his mine on Grouse creek, about 1 mile above Beaver.——Thompson's upper claim and water right on Hungry creek, near Coles, Cal., had been bought and a mill is to be built.

LANE COUNTY.

The Oregon Con. M. Co. has bought mining properties on upper Cow creek, formerly owned by the Victory M. Co., for, it is stated, $25,000. The principal members of the new company are Judge T. Carroll of Tacoma, Wash., W. J. Morphy of Chicago, Ill., G. A. Cole of Missouri, F. Eidomllier, D. Phelps, F. H. Miller and A. N. Mills of Oregon. There are thirty claims in the property, chief among which is the Victory hydraulic mine. Work has been started.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The gold production of the Black Hills for 1901 has been $12,000,000, an increase of $2,000,000 over 1900. The increase is due to increased capacities and improved facilities in mills and reduction works of the older companies and to the building and starting of a number of new mills. The greatest increase is in Lawrence county. The Homestake M. Co. alone has yielded approximately $1,000,000 more than in 1900. The new 1200-ton cyanide plant saves values that had previously escaped, amounting to about $30,000 a month.

UTAH.

BEAVER COUNTY.

Supt. D. Maudlin of the O. K. mine reports that the drift on the 400 level is now entering a body of high-grade sulphide ore. W. M. White, the Majestic Co.'s engineer, reports that Supt. Maudlin estimates that there are 10,000 tons of 40% copper ore in sight. There are, he states, on the dump 35,000 tons of ore that will average $16 per ton, and which, with a plant on the ground, could be treated at a profit. During the year the old workings have been cleaned out, new buildings built, 1000 feet of shafts and drifts run and $75,000 worth of ore taken out. This ore was taken out of a chamber 20 feet wide and 10 feet high.

G. L. Hutchins, engineer for the Bluebird M. Co, reports that a large body of high-grade ore had been struck in the Copper King mine of the company, near Milford. The ore carries copper, gold and silver in a vein 150 feet wide. The intention is to sink a large vertical shaft.

After several years shut down the old Rob Roy mine at Beaver City has been started up, with A. L. Fotheringham as manager.

BOX ELDER COUNTY.

O. P. Connor, manager of the Brooklyn mine of Park valley, states that the development work to date consists of about 300 feet of tunnels and crosscuts which show the vein carrying an average of about $20 in gold and 8 ounces of silver to the ton. The vein is from 12 to 16 feet thick. Cabins, a blacksmith shop and an assay office have been erected. A mill for the treatment of the ores of the Brooklyn will eventually be erected.

JUAB COUNTY.

Tintic production during 1901 was 2,363,993 pounds of copper, 377,216 ounces of silver and 7966 ounces of gold.

SALT LAKE COUNTY.

Lathrap & Effinger have sold their interest in the Tiewaukee group at Bingham for, it is said, $50,000. The Detroit company owning it is crosscutting from present level of deep shaft to cut the Columbia vein, which should be reached this month. A. Johnson is Supt.

TOOELE COUNTY.

F. Dole and associates are developing five copper-silver claims in the Wildcat range, 55 miles west of Grantsville. In opening up the group Mr. Dole has sunk a 100-foot shaft, and at that level, in a crosscut, the ore found assays several hundred dollars in silver and copper per ton. The vein is 9 feet between walls.

WASHINGTON.

FERRY COUNTY.

The California mine at Republic is stoping 100 tons of ore from the 100-foot level for shipment to the Granby smelter.

Supt. C. T. Porter of the Gold Lion-Little Four Co. says he is driving the tunnel ahead about 2 feet daily.

S. L. Boyer has leased the El Caliph mine at Republic for one year and has started to develop it.

STEVENS COUNTY.

The Enterprise Marble Co. has been incorporated at Spokane, capital $150,000. The trustees are J. W. Twohey, G. H. Walters, C. E. Smith, I. P. Leach and E. Twohey, all of Spokane.

WYOMING.

CARBON COUNTY.

The Indianapolis C. M. Co. has bought the Iron King group of eleven claims on Cow creek, Grand Encampment district. The group is at present developed by a shaft which shows a 12-foot vein carrying gold, silver and copper in paying quantities. The company will install a plant of machinery in the spring.

The New Rambler mine in the Douglas creek district has been sold for $500,000 to C. M. Kittredge of Omaha as agent of the Amalgamated Copper Co., the price to be paid in thirty days.

FOREIGN.

BRITISH COLUMBIA.

W. H. Aldridge of Trail states that the Canadian Smelting Works will begin at once the construction of a refinery at Trail of sufficient capacity to handle the present bullion output of British Columbia.

A strike has been made in the Center Star mine, at Rossland. In the east drift on the 600-foot level the face broke into a large body of ore, equalling in grade the best quality of ore encountered in the upper workings. About the same time the contractors in the shaft cut what appears to be the same ore body. The new strike in the 600-foot level is taken to indicate that the mine possesses excellent ore at depth.

The Granby smelter, at Grand Forks, closed down while the connections were made between the blowers and the two additional furnaces just installed. The enlarged plant has a capacity of 1300 tons daily. The new converter plant will treat daily from 100 to 150 tons of matte.

MEXICO.

The Old Mexico M. & M. Co. has been incorporated at Seattle, Wash. J. M. Roberts is president, J. B. Ault secretary and treasurer, and L. Wood general manager. The office is in Seattle. The company has bought three mining properties in Chihuahua, Mexico, located about 3 miles west of the town of Morolos and 85 miles west of St. Barbara, a station on the Parral & Durango Railroad.

Personal.

T. A. RICKARD of Denver, Colo., is at Butte, Mont.

T. ROONEY of Virginia City, Nev., is at Grass Valley, Cal.

WILLIAM A. FARISH of Denver, Colo., is in San Francisco, Cal.

JOHN HARRIS is manager Silver Crown Con. M. Co., Ymir, B. C.

"JIM" WARDNER is now operating variously in Clifton, Ariz.

F. E. WILLSON of San Francisco is in Arizona on a thirty-day trip.

O. F. KUENCER has returned from Los Angeles, Cal., to Kingman, Ariz.

GEO. M. CLARK is the present Supt. River Hill mine, Placerville, Cal.

THEO. F. VAN WAGENEN has returned from San Francisco to Lovelock, Nev.

R. J. COLEMAN of Salt Lake City, Utah, has returned there from Tonopah, Nev.

D. A. MCDONALD has returned to San Francisco, Cal., from Golovin bay, Alaska.

W. E. MORROW is supervising the construction of the Yak tunnel, Leadville, Colo.

H. VAN F. FURMAN of Colorado visited the California King mine, Picacho, Cal., Dec. 21.

JOHN MCCONAGHY is now general manager Colorado Mines Con. M. Co., Robinson, Colo.

M. BANHAM succeeds G. W. Teagarden as manager R. O. G. M. Co., Georgetown, Colo.

A. G. HEFFRON of the Bingham C. & G. M. Co., Salt Lake City, Utah, is in Tonopah, Nev.

S. F. PARKS, Amador, Cal., assumes a position with the Darien G. M. Co., Colombia, S. A.

R. H. CHANNING is now general manager Highland Boy M. Co.'s property, Bingham, Utah.

J. J. HARDWICK of Phœnix, Ariz., is general manager of the Melczer M. Co., Copete, Sonora, Mexico.

N. S. KEITH, W. J. SUTHERLAND AND C. F. VON PETERSDORFF are now residents of New York City.

MANAGER G. W. KEEL of the Butterfield mines, Bingham, Utah, has returned there from New York City.

E. C. LOFTUS has been appointed Supt. App mine, Quartz Mountain, Cal., succeeding W. Moorehead, resigned.

A. JOHNSON of Cripple Creek, Colo., has succeeded J. C. Roberts as manager Tiewaukee mine, Bingham, Utah.

JOSEPH M. NOUGUES, JR., Supt. Josephine mine, Volcanoville, Cal., was in San Francisco the early part of the week.

R. WINTERS, manager Boston & Idaho G. Dredging Co. of Idaho City, Idaho, has returned to that place from California.

COL. THOS. H. HANDBURY succeeds Lieut. Col. C. E. L. B. Davis as chief engineer officer of the department of California.

GARDNER WILLIAMS, general manager of the De Beers Diamond Co., has returned to London from a visit to California.

HOWARD B. COLLINS is now manager Big Evans M. Co., Arnold L. & M. Co., Reno M. Co. and Empire Gulch M. Co., Leadville, Colo.

F. L. ODDIE, general manager, and T. J. Siebert, Supt. of the Tonopah M. Co. at Tonopah, Nev., have returned there from Philadelphia, Pa.

H. G. MURRAY, formerly with the Gwin mine, near Mokelumne Hill, Cal., but for several years in Korea, is in San Francisco. He expects to return to Korea.

L. A. DUNHAM is Supt. Clifton Con. Copper Co., Clifton, Ariz. He has two electric drills in operation and proposes putting in a diamond drill for prospecting work.

COL. J. A. FLEMING, president of the Black Warrior C. Co. at Black Warrior, Ariz., has arrived at that place from New York to give his personal attention to the completion of acid works at the mine.

JOSEPH L. HUTCHINSON, Supt. Trade Dollar mine, Silver City, Idaho, has resigned and will locate at Boise City, Idaho, temporarily. It is understood that J. McDonald, who has been the mine foreman for several years, will be made Supt.

W. B. MOORE has resigned as foreman at the La Mina Veta Grande mine of the Cananea Con. C. Co. at La Cananea, to accept a similar position at Santa Rosalia, Sonora, Mexico, with the Santa Rosalia M. Co., of which S. Kempton is Supt.

CLARENCE K. COLVIN resigned on the 1st inst. as manager Boston & Denver Con. M. & M. Co. of Gilpin Co., Colo., which position he has filled for the past four years. Mr. Colvin will resume his profession of mining engineer at Denver, Colo.

W. M. CURTIS of Detroit, Mich., is in San Francisco. He has a tin brick smelted in San Francisco from some tin ore he brought from Alaska. He says that 4 miles from Nome, Alaska, his company has located 2200 acres containing tin ore in commercially profitable quantity.

WILLIAM S. GRAHAM, civil and mining engineer and county surveyor of Auburn, Cal., has been confirmed by the Senate as U. S. Surveyor General for California. Mr. Graham is well and favorably known in his profession and his qualifications for the office to which he is appointed are exceptionally high.

A. H. BROWN, general manager Bully Hill mines and smelter, DeLamar, Cal., has resigned and accepted appointment to the same position in connection with the Trinity Copper Co., at Kennet, Cal. He will continue his connection with De Lamar's enterprise as consulting engineer and, it is said, will have the appointment of his successor as manager.

Recently Declared Mining Dividends.

	Payable.
Bunker Hill & Sullivan M. & Con. Co., Idaho, $21,000	Jan. 6
Mary McKinney G. M. Co., Colorado, quarterly 3 cents per share, $30,000	Jan. 10
Vindicator G. M. Co., Colorado, quarterly, 3 cents per share and 5 cents extra, $88,000	Jan. 15
Daly-West S. M. Co., Utah, monthly, 40 cents per share, $60,000	Jan. 15
Rambler-Cariboo M. Co., B. C., 1 cent per share	Jan. 25
Parrott S. & C. Co., Mont., quarterly, 50 cents per share	Jan. 27
Calumet & Hecla M. Co., Mich., quarterly, $10 per share, $1,000,000	Jan. 29
Goodenough M. Co., B. C., 1 cent per share	Jan. 30
Yankee Con. M. Co., Utah, No. 1, 3 cents per share, $25,000	Feb. 1

Commercial Paragraphs.

THE Denver, Colo., headquarters of J. Geo. Leyner Co. are now at 1033 Seventeenth street, where the finely fitted offices evince progress and prosperity.

PLANS are reported completed for the first iron and steel works in Mexico, to be erected at Monterey, province of Nuevo Leon, in northern Mexico, by the Campania Fundidoro de Fierro y Acero de Monterey. The plant is to be built by Americans, and operated largely by American managers.

Catalogues Received.

Catalogue No. 2, "Hoisting and Haulage Engines and Appliances," from the Allis-Chalmers Co., Chicago, graphically illustrates and plainly describes apparatus in use in mine hoisting, with considerable technical information. The diagram on page 111, "Proper Working Load for Steel Hoisting Ropes," is illustrative of the practical values of this trade treatise. It is from the press of the Meisenheimer Printing Co., Milwaukee, Wis., and is a typographical gem.

Latest Market Reports.

SAN FRANCISCO, Jan. 9, 1902.

SILVER.—Per oz., Troy: London, 25 13/16d (standard ounce, 925 fine); New York, bar silver, 56c (1000 fine); San Francisco, 56c; Mexican dollars, 44¾c San Francisco, 44¼c New York.

COPPER.—New York: Lake, 1 to 3 casks, $14.40; carload lots, $12.12½; Electrolytic, 1 to 3 casks, $12.12½; carload lots, $12.00; Casting, 1 to 3 casks, $11.10; carload lots, $11.50. San Francisco: $15.15. Mill copper plates, $17.15; bars, 26@20c. London: £49 per ton.

LEAD.—New York, $4.00; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £10 10s 0d per ton = 2.18 cents per lb.

SPELTER. — New York, $4.35; St. Louis, $3.95; London, £16 10s per ton; San Francisco, ton lots, 5c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, $16.00; gray forge, $15.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27.00; open hearth billets, $29.50; San Francisco, bar, 7c to 12c per lb.

TIN. — New York, pig, $22.50; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27¼c; 200 lbs., 27½c; less, 28c; bar tin, ℔ lb, 32¼c.

PLATINUM.—San Francisco, crude, $19 ℔ oz.; New York, $20.50 per Troy oz

BISMUTH.—New York, ℔ lb., Subnitrate, $1.50; San Francisco, $2.50 to $2.75 ℔ lots.

QUICKSILVER. — New York, $51.00 large lots; London, £8 17s 6d; San Francisco, local, $48.00 ℔ flask of 76½ lbs.; Export, $45.00

MAGNESIUM.—New York, $2.90 ℔ lb.; San Francisco, $3.75.

ZINC.—San Francisco, 5½c; slab, 5¾c; bar, 7c; zinc dust, N. Y., 6c.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

NICKEL.—New York, 50@60c ℔ lb.

PHOSPHORUS.—F. o. b. New York 50@60c ℔ lb.

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $53.50, large lots.

TUNGSTEN.—New York, ℔ lb., 95c; San Francisco, $1.15.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¼c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 30@31c ℔ lb.; carloads, 28@29c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.00; sks, 95c ℔ 100 lbs.; chloride of lime, spot, $2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in bulk; $18 in sacks.

OILS.—Linseed, pure, boiled, bbl., 74c; cs., 79c; raw, bbl., 74c; cs., 78c. Deodorized Stove Gasoline, bulk, 14¼c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING DECEMBER 31, 1901.

690,127.—TELEPHONE-F. W. Alston S. F.
690,005.—PREPARING PRUNES—Anderson & Swink, San Jose, Cal.
690,234.—DENTAL APPLIANCE—H. C. Baghy, Santa Maria, Cal.
690,359.—DRILLING BIT—A. B. Burt, Redlands, Cal.
689,013.—CORK FOR BOTTLE — D. Chambers, San Jose, Cal.
690,100.—FLUID COMPRESSION—A. E. Chodzko, S. F.
690,021.—TERRET—F. H. Ellers, S F
690,144.—SAD IRON—C. F. Grubbs, Portland, Or.
689,874.—BOOK BINDING—F Hager, Portland, Or
690,238.—EXTRACTING GOLD — W. F. Heathman, Santa Ana, Cal.
690,304.—STOP MECHANISM—F. T. Leilich, S F.
690,305.—SEWING MACHINE—F. T. Leilich, S. F.
690,085.—PLOW—A. F. Maulhardt, Montalvo, Cal.
690,310.—COFFEE POT—J. A. McBride, Elko, Nev.
690,177.—LOOM SHUTTLE—J. H. Northrop, Tustin, Cal.
690,078.—PRESSURE REGULATOR—P. H. Reardon, S. F.
690,375.—AGITATING MACHINE—G. Rubsch, Jr., Los Angeles, Cal.
690,081.—SLIDING DOORS — D. Schuyler, Los Angeles, Cal.
690,328.—HARROW—J. Smith, Tekoa, Wash
690,204.—LADDER — Strauss & Johnson, Seattle, Wash.
690,085.—TOOTH CROWNS—J. F. Twist, S. F.
690,089.—UNLOADING APPARATUS—G. P. Wetmore, S F.
35,499.—DESIGN—A. Heunisch, S. F.
35,518.—DESIGN—A. W. Miller, Riverside, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

HARNESS TERRETS.—No. 690 021. Dec. 31, 1901. F. H. Ellers, San Francisco, Cal. The object of this invention is to improve the terret or ring which is attached to the pad or saddle of harness through which the driving reins pass, so that the rein can be easily introduced or removed at any part of its length without the necessity of pulling the ends through. The terret has a portion of its periphery cut away provided with sockets, and balls with spring pressure behind them normally close the opening. If the edge of the rein is pressed against the balls they will separate and allow the rein to pass in or out, but the pitch of the edges of the opening is such that the rein will not come out of its own action.

BOTTLE CORK.—No. 690,013. Dec. 31, 1901. D. Chambers, San Jose, Cal. One-half assigned to S. Chambers and B. F. Kent of same place. The stopple may be made of cork or any suitable material and has parallel holes extending through it and a recess in the top. A wire staple passes through these holes and through a washer in the interior, which washer presses against the bottom of the cork when the loop of the wire made exterior to the cork is pulled upon. This loop may be normally concealed within the central recess in the top of the cork.

VESSEL UNLOADING APPARATUS.—No. 690,089. Dec. 31, 1901. G. P. Wetmore, San Francisco, Cal. This device is designed to unload barges or vessels. It consists of a series of compartments having discharge chutes with controlling gates and an endless traveling carrier located beneath these compartments and near the bottom of the hull of the vessel. Either of the compartments may be discharged by means of a gate and the carrier will transfer the material to the end of the vessel while it is raised by an elevator and delivered upon the wharf or any other desired point.

APPARATUS FOR FORMING SEAMLESS TOOTH CROWNS.—No. 690,085. Dec. 31, 1901. J. F. Twist, San Francisco, Cal. This invention is designed for the formation of seamless tooth crowns from caps of thin metal, such as gold. It consists of an interior die having the shape of both the cusp and the lateral surfaces of the crown upon which the crown is fitted and an exterior two-part die of the same shape within which the interior member and tooth crown are placed. In conjunction with this is a mechanism by which the two parts are braced together and the crown is shaped to conform therewith.

APPARATUS FOR PREPARING PRUNES.—No. 690,005. Dec. 31, 1901. W. C Anderson and J. L. Swink of San Jose, Cal. Assignor to Anderson Prune Dipper Co. of Santa Clara, Cal. This invention is designed to prepare dried prunes and like fruits by subjecting them to steam or hot water. It consists of two horizontally journaled concentric cylinders with an intermediate spiral conducting blade, means for admitting the material to one end and discharging it at the opposite end. These cylinders are journaled in a suitable containing tank, so that the fruit in passing through them may be submerged in the water or subjected to steam if desired. The discharge end has radial divisions, and there is a receiving cone with ribs upon its surface which delivers the fruit from the end of the apparatus. The buckets are fixed on the outer head of the cylinder projecting to variable distances, so that the fruit is evenly and gradually discharged as the cylinders rotate.

CONTINUOUS COMPRESSION OF FLUIDS.—No. 690,100. Dec. 31, 1901. A. E. Chodzko, San Francisco, Cal. This invention is designed to compress fluids either liquid or gaseous in a continuous operation. It consists of a series of revoluble shells with suitable inlets and vanes revoluble with the shell which act to direct the fluid toward the periphery. Within the periphery are fixed collecting scoops which receive the fluid and transfer it to the next succeeding device, where the pressure is to be increased by successive devices. Receivers are interposed between the centrifugal machines so that fluids such as air may be compressed from the first machine into the receiver from which it is prevented from returning by check valve, and the next centrifugal machine taking the air or fluid from the receiver at the pressure therein will discharge it into another receiver at an increased pressure from which a third machine may take it and so on until any desired compression has been obtained.

Fine Gold Placers.

There is really no especial difficulty or mystery about saving placer gold. The real difficulty consists in finding the deposit containing sufficient fine gold to make it commercially worth while to try to save it. It may be accepted that no apparatus or process that has been devised, or can be devised, will commercially recover absolutely all of the gold in the material treated. There are mechanical limitations which make such commercial recovery always approximate. The loss may be trifling but it is always something.

What gold there may be in a placer deposit is nearly always measurable by well understood methods of prospecting and estimating. The point of danger to the theory applied, is in carrying its application too far. By this is meant that the ground actually prospected can be estimated with fair accuracy, but the mistake is common of assuming that the prospecting prospects more ground than it as a fact does. This ground that is assumed as prospected, estimated as if it was, occasions that too frequently noted discrepancy between the prospectus figures of a placer mining proposition and the subsequent actual results. The common explanation is to make a scapegoat of the gold saving apparatus. It is accused of not saving the fine gold, and not being able to talk back it usually is made to carry the burden of the failure. The real explanation is that there was originally no gold to be saved.

The prospectus was an unconscious misstatement. The writers of such papers always believe what they say to be true. They simply mislead themselves as to the facts, which look simple when they are not. These errors of preliminary estimation of placer deposits are much more common where the gold is fine than where it is coarse. With coarse gold you have it or you do not have it. There is not much room for averages or estimation between extremes. With fine gold in a placer deposit more is trusted to the imagination. True, this will be resented, honestly, but it is nevertheless the fact.

Fine gold is likely to be spread over much more area of ground than coarse gold. It is not always concentrated at the bottom of a deposit. It is not always superimposed over contiguous coarse gold placers or bedrock concentrations. It is, however, almost invariably in place concentrated into beds or layers between very much thicker beds or layers that contain commercially no gold at all. These bed concentrations are not coextensive with the entire "wash" deposit, though the prospecting may tend to give this idea. They are areas of former stream-flow bed, where the bed did not remain long fixed but was continually shifting its place in its own stream-drift accumulations. These changes would leave uneroded areas of the bed containing concentrations of fine gold, of more or less limited extent. The accident of time has made them possible placers. All the temporary beds, however, do not make such accumulations. The time element at the period of formation determines this very largely. Examples of this characteristic occurrence of gold-bearing gravels, which can readily be identified as being the fragmentary remnants of the temporary bed of the old stream, are common in the older placers of California. The miners termed them "upper leads" or "top wash." The great depth of the gravel deposits made the separation of the superimposed beds very plain, where in the shallower recent deposits it is overlooked.

The entire superficial area of a "wash" is therefore never commercially gold bearing, and only a small fraction is. The accidents of time and erosion may have made some of these fine gold bearing beds become the present surface. To prospecting they will prove richer than the ground underneath, but the prospector rarely estimates that way. He usually considers that the surface of "wash," if payable, indicates greater riches beneath at the bedrock. This easily leads to self-deception in estimating the depth of the placer deposit. The accident of a number of surface prospects, scattered at random or with system over a considerable area, giving payable returns, also leads to an incorrect estimation of the surface extent of the minable placer ground. These prospects are considered as if they were prospects of the same deposit or bed, whereas they may be, and often are, from several different beds of gold bearing ground with large areas of worthless ground between.

The methods of prospecting applied to determine the value of possible dredger ground in the United States are refined enough to miss these common errors of estimation. Taking a full section each time clear from surface to bedrock, and taking many such sections close together, the chances of error are eliminated. The danger to which attention is called, is the risk that values are overestimated where the old methods of panning the surface and edges of a "wash," and trusting the imagination for the quantities, are employed. It pays to be thorough in prospecting fine gold placer deposits. There is no magic in the distance of a prospective placer from the miner and there should be no mystery. The same exact methods that eliminate the imagination should be applied to estimate the placers of distant lands as are applied to those near at hand.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Benton Mills Dam, Mariposa River, Cal., During Construction; Benton Mills Dam After Completion, 29. Sketch of Benton Mills Dam, 32. Fortuna Mine and Mill, Fortuna, Yuma Co., Arizona, 34. New Plant of F. M. Davis Iron Works, Denver, Colo., 36. Some Occurrences of Gases in a Quicksilver Mine, 37. Mining and Metallurgical Patents, 37.

EDITORIAL.—Fine Gold Placers, 29. Mine Operations at the Lincoln Mine; Shortage in Rain and Snow Fall; Marble Deposits on the Pacific Coast; The Marketing of Silver; Definition of "Mining Claim;" Reported Buying of the New Caledonia Nickel Deposits, 30.

MINING SUMMARY.—39-40-41.

LATEST MARKET REPORTS.—42.

MISCELLANEOUS.—Concentrates, 31. The Benton Mills Dam, Mariposa County, Cal., 32 Cost of Development Work; Fine Silver for the Year; Advanced Methods of Electric Precipitation, 33. La Fortuna Mine, Arizona; Notes on Protection of Metal Work by Asphalt Concrete, 34. Solutions; Oxygen and Hydrogen Gases by Electrolysis; Increasing U. S. Silver Coinage; Some Mine Data; Platinum in Oregon, 35. Process for Welding Copper and Steel or Iron; A New Denver Mining Machinery Plant, 36. Some Occurrences of Gases in a Quicksilver Mine, 37. Revision of Mining Laws; Value of Mineral Products in 1900; Mining and Metallurgical Patents, 38. Personal; New Patents; Notices of Recent Patents; Commercial Paragraphs; Recently Declared Mining Dividends, 41-42.

On another page the figures of some of the mine operations at the Lincoln mine on the mother lode, at Sutter Creek, Cal., are exceedingly interesting and instructive. Supt. E. C. Voorhies would seem to have made a world's record for cheap shaft sinking, and, in making it, given to California mining the lead in low mining costs that it has had for many years in low milling costs. The amount of powder used in this shaft work indicates ground of average hardness, and the labor cost per foot of sinking indicates an excellent quality of work by the miners. Taking into account the size of the shaft opening, the rate of progress and its costs are not very different from what they would be for tunnel work in the same kind of ground, which is exceptional practice.

The rain and snow fall in southern Oregon and in California are up to the date of this writing much less than usual at this period of the season. In ordinary seasons there would be several feet depth of packed snow at elevations of 5000 feet in the Sierra Nevada mountains. At the present time there is no snow on the ground at all at 7000 feet elevation. The water supply for mining will almost certainly be short this season, particularly where dependence is wholly on the direct run-off. Reservoir supplies are less likely to be short. The early seasonal rains of October and November gave the reservoirs so good a start toward filling that the late rains are sure to fill them. The snow that will probably yet fall before April will melt rapidly through not being packed and frozen down. The season of high water in the rivers will come early this year, but it is exceedingly improbable that it will last long.

Marble deposits have been receiving considerable exploitation on the Pacific coast during the last two years. The success made by a company operating near Spokane, Wash., first called attention to the market for this stone in the western third of the United States, with the result that many more quarries have been worked in Washington, and later discovered deposits in Idaho, New Mexico and on the Prince of Wales archipelago of Alaska, are being opened on a considerable scale. For some of the deposits strong claims are made as to quality, that if sustained as exploitation continues, will build up more than a purely local industry. The development of the modern type of fire-proof building construction, using marble very largely for interior work, has enormously increased the market requirement. The late improvements in stone quarrying and working tools and machinery have made a great reduction in the cost of production. Profits have been very satisfactory and it seems reasonable to anticipate that they will remain so.

The Marketing of Silver.

Silver has declined in sale price in even figures 10 cents an ounce since the beginning of 1901. At this time of writing the lowered price seems due rather to a lessened demand for it as a money metal than to a diminished use in the arts. China has taken less silver than in former years and it has obtained what it has taken from sources of supply less distant than the United States. Australia has settled part of her debit balances to Europe and the United States by credits for silver shipped direct to China. It cost less for transportation, and used up less time during transit, taken from Australia, than the charges would have amounted to if shipped from the United States.

The lines within which trade in commodities and money is conducted leave much narrower margins for profit than formerly. The trade in silver is not an exception to this tendency. Dealers in the metal understand this fully. The men who mine it have in the past paid little attention to the subject. It is, however, quite an important matter, particularly with the lessened profit in the business. The consumers of silver, referring by this particularly to the Chinese and Eastern peoples who hoard it, do not pay the costs of transportation of the metal to them. The dealers or middlemen charge all these costs and their own compensation to the producers. The number of middlemen the metal may be handled by, though obscuring the nature of the transaction, does not really change it.

The greater quantity of silver produced in the United States reaches its marketable shape as fine bullion in the western third of the country. While the silver consuming arts have their present industrial establishments almost entirely on the Atlantic coast, the same tendency toward reducing costs, that has already moved the centers of iron and lead manufacture into finished commodities westward to the mines, and is now moving the manufacture of copper commodities westward, will eventually move the silver art industries out where the mines are. This change will, however, be slow, unless, as suggested by this journal, the miners themselves become the manufacturers. But these conditions have no force whatever in dealing with the real price-making market, the money demand of the Chinese and other Eastern silver-hoarding races. Here, it would appear, is an opportunity for the silver miners of the West to get back some of the profit they have lost by the lowering of the price.

It should be perfectly practicable for the money trade in silver with the Orient to be put on the shortest time and distance route from the producer to the consumer. This would make San Francisco, and not New York, the natural silver market of the United States. New York is double the distance and time from the silver mines that San Francisco is.

San Francisco already is the natural smelting and refining center for silver ores from the greater area of silver-producing territory of the United States and countries bordering on the Pacific. It should be the smelting and refining center for all the silver exports to the Orient. New York costs of smelting and refining, which include transportation from the mines, are necessarily higher than at San Francisco.

New York is double the distance and time of San Francisco from China, the great consuming market. The price quotations of silver in New York and San Francisco are exactly the same. It would appear from this that so far as the silver miner is concerned there is no choice between the two points as a market. There is, however, a commercial difference. San Francisco being the nearest point to the mines and the nearest to China, the difference in actual costs must be in its favor, and there must, therefore, be a larger margin in commercial cost charges. These charges on silver bullion are interest on the gold value while in transit, insurance while in transit, and freight. The first two are directly proportionate to the time intervals and the last to the distance. The silver miners, however, are not compelled to accept this commercial situation as a finality. They can, as other mining industries are doing, carry their own insurance risks. They can save the difference in interest direct. Freight is a less simple problem, though not an insurmountable one. England and Germany own most of the ships that carry silver from New York, but New York owns most of the ships that would carry silver from San Francisco.

The matter is quite worth the attention of silver miners. No one of the money differences is large, but the aggregate of them all is a large sum. It will be a larger sum in the future, when the exploitation of China is well under way.

Definition of "Mining Claim."

The meaning of the term "mining claim," as used colloquially and as used in mining law, is not identical. The term, as commonly used, is not the equivalent of "mining location," but, in the construction of the mining statutes by the courts, a single location is regarded as a claim. The question of the exact meaning has been raised with reference to placer claim locations. The law limits the location of an individual locator to twenty acres, but permits associations of locators up to eight in number to make in one location a claim of twenty acres for each. Lindley, on mines, says of the legal requirements of assessment work on such placer claims:

"A location by an association of persons, embracing more than twenty acres, may undoubtedly be perpetuated by the performance of the same amount of labor required of an individual locator. Work need not be done on each 20-acre tract of a location embracing 160 acres made by such an association. But the appropriation by eight persons of 160 acres is accomplished by one location. While this suggests an inequality of burdens, it is in our judgment the only consistent method of construing the statute. A lode claimant or an association of persons may locate a full claim of 1500 feet in length. A location of less than the maximum would not decrease the burden as to the annual work. The volume of work is not gauged by the size of the claim located. There is no sliding scale adjusting the matter according to area. In determining, therefore, the amount of annual work to be performed in connection with an aggregation of locations, each location is to be construed as a claim within the meaning of the law, regardless of the superficial area comprised in any one or more of them."

The reported buying of the New Caledonia nickel deposits by the United States Steel Co. calls attention to the absence of extensive deposits of high-grade nickel ores in the United States. New Caledonia ores, as they are hand-sorted at the mines for shipment, run about 7% nickel. Such deposits as have been found in the United States carry from 1% to 4%, the latter being exceptional. So far as known, none of the deposits, with the possible exception of that at Riddles, Or., which is quite low grade, are very extensive. It has not been noted that they would justify the construction of special reduction plants. It is possible the lack of development will explain the supposed small extent of the known deposits. There has been little inducement to develop them. The ore taken out could not be sold to pay the cost of the development work. That the business of nickel mining in New Caledonia and Canada has been profitable is well known. The United States Steel Co., the largest single consumer in the world, has found it cheaper to buy the richest known deposit in the world than to continue paying the profits to the monopoly which has fixed the price of the metal during the last few years. New Caledonia is half the world around in distance from the consumers in the United States. Even with sailing ships, the metal, if brought in the ore to the United States, will have a transportation cost against it of 8 cents a pound. It is possible this may be lessened somewhat by reducing the metal in the mines at New Caledonia. Still, there would be a margin of transportation cost against the distant supply point that may be sufficient to compensate the penalty of lower grade ore and more limited deposits in the United States. The possibilities of nickel production in the United States are certainly potential enough to make their consideration worth while. Possible mines should not be overlooked, and there is certainly a place or an opportunity for the inventing metallurgist. So much has been done for the cheap metallurgical reduction of low-grade copper ores, with attention concentrated on it as a result of large profits, that it would seem as if a corresponding advance might be made in the cheap reduction of nickel from low-grade ores.

Concentrates.

ASBESTOS is one flexible substance that electricity will not burn.

ONE of two locators being an alien jeopardizes only the alien rights.

AN ore containing 1% of gold would assay 291.6 ounces gold to the ton.

THE cost of refined sheet platinum in San Francisco is 5 cents per grain.

HUNGARIAN RIFFLES are sawed slats set in the bottom of a frame that exactly fits into the bottom of the sluice.

FINE dry coal dust is just as dangerous as coal or petroleum gas, and will explode with equal force under the same conditions.

ANTIMONY as an alloy of aluminum gives it hardness and elasticity, but alloyed with copper it destroys all the good qualities of the latter metal.

A CUBIC FOOT of stiff clay will weigh 135 pounds; of sand, 95 pounds. The "angle of repose" for the first named material is 55°, for the sand 30°.

THE deepest shaft in South Africa is the Catlin, near Elandsfontein, 8x28 feet, 3754 feet deep. At Turfontein the diamond drill struck the "reef" at a depth of 4800 feet.

TO STEEL an axe, first cut the old blade off, then split the axe open, take 1 inch of square steel, forge down and weld on, then shape up, grind and temper. It is cheaper, however, to buy a new axe.

REGARDING gauge of track, the gauge is the distance in the clear between rails. A "3-foot gauge car" is one adapted to a track with rails just 36 inches apart; the wheels would measure 35½ inches between flanges.

SOME mining is being done in all the countries on the west coast of South America by American companies and methods. It is not advisable for American miners to go there except under contract with some company.

WEIGHT FOR WEIGHT, there is not much difference in the fuel value of petroleum of different gravities, the average estimate of the fuel value being that about three and one-half barrels oil equal one ton of good bituminous coal.

IN a calm, quiet atmosphere coal dust or petroleum gas will lie upon the ground or at the bottom of any vessel, but by walking among it or by agitating it in any way it mingles with the air and a flame will ignite and explode it.

A MINING LOCATION made on unsurveyed public land is valid. A valid homestead settlement can not be made on unsurveyed public land, according to a land office decision in the case of Henry vs. Delano in the Oregon City, Or., land district.

"CONCENTRATES" does not know of any case where the fumes from a chloridizing furnace are condensed to recover the volatilized gold and silver, though as a metallurgical proposition apart from any commercial profit the idea seems feasible.

ZINC DUST is used in the cyanide process for precipitating the metal just as zinc shavings are used. Experience shows rather less zinc consumed when the dust is used and there is a somewhat less quantity of aurocyanides requiring refining.

ONE CUBIC FOOT of petroleum weighs fifty-five pounds, 1 cubic foot of solid coal weighs eighty pounds, 1 cubic foot of loose average coal weighs fifty-six pounds, 1 cubic foot of sea water weighs 64.312 pounds, 1 cubic foot of fresh water weighs 62.4425 pounds.

THE velocity of steam does not vary directly with the pressure. The velocity of steam at 180 pounds gauge pressure is 1969 feet per second, and at 100 pounds 1876 feet per second. The theoretical velocity of water at 100 pounds pressure is 122 feet per second.

"FLASKS" or bottles to hold quicksilver can be used over and over again. They are usually made of boiler iron and weigh about 14 pounds each. A gallon of mercury weighs 136 pounds. A flask holds 76½ pounds. A cubic foot of mercury weighs 849 pounds.

"SECOND-FEET" is the discharge of water in cubic feet per second; 1500 second-feet means a flow of 1500 cubic feet per second. This multiplied by 3600 (the number of seconds in an hour) gives 5,400,000 cubic feet per hour; that divided by 100 gives 54,000, the flow in miner's inches.

THE real genius of the inventor is his ability to work, his patience and industry, his perseverance under adverse conditions. But the man who "throws out ideas" and says or thinks "the rest is a mere matter of detail," will never produce anything of consequence. It is in the "detail" the whole thing lies.

GLACIERS have undoubtedly had a great deal to do with the breaking down of mineral veins and the distribution of surface ores and metals. The operations of glacial ice have been moving on the most gigantic scale, vast quantities of vein material having been liberated and spread out by such action.

AS TO the number of board feet in a stick of timber 4x4 inches at one end and 8x8 inches at the other, the stick being 24 feet long, there are two ways of arriving at a correct answer. Add the areas of the two ends to four times the area of the center section and multiply by one-sixth of the length; or, multiply the areas of the ends and extract the square root; to this add the areas of the two ends, and multiply by one-third of the length. The answer by either process is 74⅔ feet.

BLIND VEINS apexing within the side lines of prior locations are excluded from the grant of veins discovered, made under a tunnel site location. The tunnel run by virtue of a tunnel site location has no right of way through such blind veins. The preceding is the rule established by the United States Supreme Court in the case of the Calhoun G. M. Co. vs. Ajax G. M. Co.

A MAN can do what he pleases with the bank of the stream which he owns; but if he diverts the course of the stream or narrows the waterway to the injury of an owner on the opposite bank or elsewhere, the latter party has his remedy in an injunction or a suit for damages. This system works fairly well, so far as damages due to the action of streams at their ordinary stages are concerned.

ANYONE claiming a forfeiture of a mining claim for failure by former owners to perform annual labor or improvements as required by Section 2324 R. S. U. S., has the burden of establishing such forfeiture, and an allegation of failure to perform $100 worth of work on the claim in any year is not sufficient, since the making of improvements on the claim to that amount would be equivalent.

A CIRCULAR MIL, as the term is employed to measure the cross-sectional areas of wires used in electrical work, is .7854 square mil, the mil being .001 inch. The electrical resistance of a wire 1 foot long and having one circular mil cross-section area, being known as the result of experiment, the electrical resistance of another wire of the same metal and different cross-section is readily calculated.

IN the absence of any special agreement otherwise, an invention made by a member of a partnership is the exclusive property of that member, and the patent when granted belongs solely to him. Even if the funds for prosecuting the application for the patent, making experiments and the like were paid by the partnership, that fact does not make the invention or patent partnership property.

WOOD ASHES can be used to assist in keeping amalgamated table plates in good working condition where the mill is not run nights. After shutting off the power at night and brushing up the plates, wood ashes freely sprinkled over them, and wet to form a paste, can be left on them till morning. The potash of the wood ashes cleans the plates of all grease and tends to soften and liven up the amalgam.

BORAX GLASS, powdered common window glass or bottle glass, in the proportion of two to one, is a good flux for aurocyanides. The glass should be powdered to 40 mesh. The proportions should be varied to suit the proportion of zinc, etc., contained in the aurocyanides. No soda should be used. The slag will not be free from gold and silver, so the slag should be remelted with lead or shipped to the smelter.

AN applicant at a U. S. land office to secure timber must swear to a non-mineral affidavit. He must take oath that he knows the conditions of the land at that time by personal observation; that the land is not occupied by any person or persons; that there are no mining claims, lodes or mineral deposits to his knowledge on said land. Coal, salines and coal oil claims on a tract of land exclude it from entry as timber land.

GOOD SOLDER is easier bought than made, but if some distance from base of supplies buy block tin and cut it up into about one pound pieces, weigh it and put in an equal weight of lead. Melt in a ladle, stir it and run it off into a mold to cool. To test solder and find out whether it is of good quality, hold it up near your ear and bend it. If you can hear it cringe or a crackling noise it is good, and if not it is poor—too much lead and not enough tin in it.

THE cessation of an advertisement in a popular and well circulated journal indicates to the public: 1. Either that the firm has quit business or is closing it up. 2. Or have found their goods unsalable in competition with better advertised and better pushed goods, and, therefore, withdrawn from the general market. 3. Or the firm has lost enterprise or got into a rut, any of which diminishes public confidence and also makes buyers distrustful of liberal or prompt treatment.

THE manner in which the field coils of a dynamo are connected will depend upon the use for which the machines may be constructed, but in a simple type where the voltage is supposed to remain constant they are connected across the circuit in multiple with the armature. After a dynamo has once been operated there will remain in the iron of the fields a certain amount of magnetism called residual magnetism, which will be sufficient to induce electrical action when the machine is started.

A QUICK and exact method for the quantitative estimation of copper in pyrites by precipitation with aluminum and electrolysis is as follows: Two to five grammes pyrites are dissolved in aqua regia, the nitric acid evaporated off, and the residue redissolved in five cubic centimeters of dilute hydrochloric acid and ten cubic centimeters of water. The whole is washed into an Erlenmeyer, diluted to 100 cubic centimeters, and warmed with excess of sheet aluminum on the sand bath. When the solution is colorless, showing that all the iron oxide is reduced, the solution is filtered and the residue (copper and aluminum) is washed free from chlorine, the filter paper burned, and the copper and aluminum dissolved in nitric acid. The copper is then subjected to the ordinary electrolytic estimation.

IN firing with petroleum, if the fire should go out, as it sometimes does when water is mixed with it, the oil continues to spray onto the hot furnace, generating a gas. If you attempt to light the fire the gas will explode with violence. First shut off the flow of oil, then blow the gas up the smokestack, then you can light the fire with safety. Never venture near a barrel or other vessel which has the petroleum in it, with a naked light, as it is liable to have gas in it, and is more dangerous than when full of petroleum.

TONOPAH, NEVADA, ores are silica ores from a smelting point of view. They contain no iron, lead or lime. All of these have to be provided as fluxes to smelt these ores. Tonopah camp does not yield these fluxes nor the fuel required. The ores were considered smelting ores because the miners shipped them to smelters at first instead of shipping them to stamp mills for treatment by amalgamation. This latter method of reduction may be found efficient, and in connection with cyanide treatment of the tailings would recover a percentage of the values.

THE Crown Mountain G. M. Co., Dahlonega, Ga., sluices its ores by the use of electricity. Twelve miles from the point where the company operates its mill there is a waterfall on the Chestatee river. An electric power plant is there, a pumping station on the banks of the river at the foot of the mountain, and a 10-inch pipe laid to a reservoir on the summit, 560 feet higher than the mill station. The reservoir has a capacity of 750,000 gallons; the triplex pump, propelled by electricity, forces 1500 gallons of water per minute into the reservoir, furnishing abundance of water for sluicing the ores.

FAILURE to perform the annual assessment work on a lode location does not forfeit a mill on a millsite location that may have been located to be used in connection with the mining location. The two locations are distinct things. Either exists without the other. There is no law requiring assessment work on millsite locations or providing for forfeiture of improvements made on millsite claims. A valid millsite claim cannot be located on land that is subject to location as a mining claim. The improvements then that are made on a millsite claim can only be appropriated when abandoned or by an adverse patent granted to the land.

PETROLEUM expands or contracts 1% for every 20° difference in temperature. Petroleum gas alone will not explode. It takes one volume of gas to ten of air to explode it. Petroleum gas is heavier than air, therefore is always at the bottom. A jet of gas into an atmosphere of air would burn the same. One pound of petroleum fuel, heated and atomized by air in a marine boiler will evaporate thirty pounds of water, one pound of Wellington coal will evaporate eight pounds of water. Eighty gallons of petroleum occupies 11.7 cubic feet, about one-quarter the space of coal. Eighty gallons of petroleum at 5 cents is $4; one ton of Wellington coal, $9.50, a saving of $4.50 per ton.

A FOUNDRYMAN gives it as his opinion in melting scrap sheet brass that the addition of half an ounce of aluminum to a No. 18 crucible of metal is the right proportion for a mixture that is high in spelter. Such a metal will run fluid in all the molds. He says that, in order to obtain a nice golden brass from scrap sheet, one pound of spelter and an ounce of aluminum is a good condition to bring about the golden color. Some brass founders have a way of putting in this metal while the pot is in the furnace and letting it boil, while some add it just before pouring. When the aluminum is added just before pouring it takes a smaller quantity than when it is put in and allowed to boil.

IN the electrolytic manufacture of sodium a mixture is made of seventy-five parts by weight of potassium chloride and fifty-nine of common salt. This mixture is electrolyzed in the electric furnace in a wide, shallow crucible with a partition in the middle, which does not, however, reach the bottom. The electrodes are placed horizontally, and pierce the sides of the crucible at opposite ends of a diameter perpendicular to the partition. The cathode side of the crucible is kept cold by a current of water. The anode is a solid carbon rod, and the cathode is a metallic tube, the axis of which is level with the surface of the fused mixture in the crucible. The sodium, which only contains about 1% of potassium, is removed through this tubular cathode.

MEN frequently make mistakes in the purchase of even the best and latest style of machinery, and are obliged to make changes in order to better adapt them to their business. In such cases the machine or machines can not be classed as second-hand in the true meaning of the term. For instance, a man may purchase a steam boiler and engine of the latest style rated at a certain power; but after a few months he may find it necessary to make certain changes and additions to the plant that will require much more power than the engine and boiler is capable of affording, and a change for one of greater capacity is required. But in such cases there is no necessity for making a large sacrifice or of putting it on the market as second-hand machinery. In such cases a liberal arrangement can always be made with the manufacturer for an exchange of one of larger size and greater capacity. The fact of a machine having been used but a few months under such conditions is no reason why it should not be purchased by another and smaller plant, where the power would be amply sufficient.

The Benton Mills Dam, Mariposa County, Cal.*

Written for the MINING AND SCIENTIFIC PRESS.

The Mariposa Commercial & Mining Co., operating the mines of the Mariposa grant, in Mariposa county, Cal., to supply their plants with electric power have heen preparing to use some of the water power of the Merced river, which flows across the grant. A portion of the works constructed by the company consists of what is known as the Benton Mills dam, huilt in the Merced river, ahout 30 miles helow Yosemite valley, at an altitude of 850 feet. It is about 100 yards ahove the bridge where the main county road from Mariposa to Coulterville crosses the river, and 150 yards above the site of the Benton mills, where at one time 120 stamps were dropping. It is located just ahove the site of the old dam which supplied the power for the mills.

All of the Sierra rivers have their high stages, when work in them is impracticable through the winter and spring and very nearly through the summer months. The Merced river is pretty well south of the region of maximum precipitation and there is, ordinarily, a season of low water a little longer than for the more northern streams. Last year was an exception and high water continued, so that work on the dam in the river did not commence till July 14. For several weeks after this time, while the cribbing foundation was heing put in, the stream flow exceeded 6000 miner's inches (22 cubic feet) per second, heing about three times the quantity of the ordinary minimum flow of this river.

The method employed in making the construction is as follows: A wing dam of sacks and dirt and rock was run out from the south bank of the river, turning the water into the north and middle channels, and the foundation cribbing and toe were put in place and finished, with the exception of a section of the top 4 feet of the toe planking, ahout 30 feet long, which was left open to allow the water to run through. Very little trouhle was experienced with water in this part of the work, all the seepage through the wing dam heing handled very easily hy a 10x6x10 duplex pump.

A wing dam was then run out from the north hank of the river, turning the water into the middle and south channels, and the hedrock in the north channel was stripped, a wing dam having also heen thrown across the channel helow the site for the foundations to keep out the hack water. More water was encountered in this channel, necessitating the use of a 6-inch discharge Jackson centrifugal pump, helted to an 8x10 horizontal engine. Work was delayed several days at this point (August 2) hy a sudden rise in the river due to a cloudhurst in the mountains ahove Yosemite valley which washed out some of the up-stream wing dam. The toe planking on this section of the foundation cribhing was omitted for a length of 36 feet and a depth of 4 feet to allow the water to pass through while work was in progress in the middle channel.

It was in the middle channel that the greatest difficulty with water was encountered. Progress was made very rapidly through the 8 feet of gravel first encountered, hut the underlying quicksand required sheet piling driven across the bottom of the channel as closely as possible, and the seepage was all that could he handled hy the 6-inch pump and another 5-inch centrifugal pump which was installed as an auxiliary. Bedrock was stripped along the toe and the planking and cribhing were put in place as shown in the cross-section of the dam, the sills being holted to the sides of the channel.

The two views on the front page and the two cross-sections accompanying this, the river bed across which the dam was huilt, and the elevation of the cribhing and "A" frames of the dam, give the dimensions and principal details of the construction, making it unnecessary to repeat them in description.

The foundation cribbing was finished and filled with hroken rock and gravel, the toe planking which was omitted was spiked on under water, and the river was allowed to run over the top of the toe planking while the superstructure was being erected. The planking was nailed on, leaving three doors with a width of 36 feet and a height of 8 feet hinged on the upper side, through which the water flowed while work on the skin and abutments was completed. The doors were closed at 5:30 P. M. on November 19 and the water flowed over the crest of the dam at 7 A. M. Novemher 21, it having taken thirty-seven and one-half hours to fill the dam. The foundation

cribbing was started by laying the longitudinal sills in cement on bedrock and bolting them down with 1x42-inch anchor bolts, 6-foot centers. This was carried out throughout except in the bottom of the middle channel, where the construction plan was as is shown in the sketch, the foundation cribbing of the old dam being used where available. This was all that there was of the old dam, the portions in the south channel being torn out and that in the north channel having been washed away years ago.

The foundation cribbing is all 6-foot centers, with the longitudinal sills reinforced by blocks in the spaces between. The "A" frames are also 6 feet center to center. The details of the construction cost account are as follows:

LABOR.			
Carpenters, laborers, etc	$15,381 13		
Superintendence, surveying, etc	281 28	—$15,662 41	
MATERIAL.			
Lumber, 647,000 ft. mountain pine	$12,499 24		
Round timbers, 43,000 ft, board measure	750 02		
Bolts, nuts, washers, etc., 14,950 lbs.	627 87		
Drift bolts, ¾x21-inch, 6720 lbs	228 52		
Nails and spikes, 6800 lbs	264 26		
Cement, 101 bbls	537 60		
Wood, 121 cords	364 70		
Coal (blacksmith's), 5900 lbs	87 50		
Oil, packing, waste, etc	90 16		
Powder, caps and fuse	60 54		
Sundries	58 37	—$15,568 78	
PLANT.			
Tackle, tools, derrick, etc	$ 583 77		
Cars, rails, wheelbarrows, etc	289 69		
Pumbing plant (2 boilers, 2 engines, 2 centrifugal pumps, 5″ and 6″, piping, fittings, etc)	1,192 03	—$ 2,065 49	
		$33,296 68	

The water turned by the dam through the headgate shown in one of the views is carried 450 feet in a 5x16-foot box flume of ordinary construction to the power house, where it is used under a head of 25 to 30 feet (depending on the stage of the water in the river) to drive four McCormick turbines, direct connected to a 400 K. W., 3-phase, 7200-alternation Westinghouse generator, and also a 15 K. W. direct-current exciter, run separately by two 9-inch turbines. This plant will supply power to the mines on the grant, except for a short time in the summer, when it will be impossible to run the plant to its full capacity owing to scarcity of water.

For the data used herewith and for the diagrams and other illustrations the MINING AND SCIENTIFIC PRESS is indebted to the courtesy of Mr. Chas. C. Derby, manager of the Mariposa Commercial & Mining Co., and Mr. W. G. Britt, the foreman of the dam construction work.

Cost of Development Work.

The report of the Centre Star M. Co., of Rossland, B. C., for the year ending September 30, 1901, shows in full detail the cost of the development work done in the mine during the year:

	Sinking Main Shafts.	Sinking Small Shafts.	Raising.	Drifting.
Total advance, feet	337	50.5	324.5	2,107
COST PER FOOT.				
1. Drilling	$12 95	$7 61	$7 51	$5 43
2. Blasting	4 89	1 77	2 05	95
3. Explosives	3 91	3 39	3 27	2 81
4. General mine supplies	2 35	1 54	97	57
5. Mine lighting—candles	62	35	16	16

Total	$99 21	$44 93	$31 02	$20 16

Fine Silver for the Year.

The monthly extremes of silver quotations for fine silver in the New York market during 1901 were as follows:

	Highbest.	Lowest.
January	64c	60⅛c
February	61⅝	60⅛
March	61¼	59⅜
April	60⅜	58½
May	60	59⅛
June	60	59¼
July	59⅛	58⅝
August	58¾	58⅛
September	58½	58⅛
October	58⅛	57⅛
November	57⅜	54⅞
December	55¼	54

Advanced Methods of Electric Precipitation.

Written for the MINING AND SCIENTIFIC PRESS by J. H. JORY.

In 1894 an article appeared in the MINING AND SCIENTIFIC PRESS relating to the "electrolytic sluice," a process then in its crude form, and proposed principally for the electrolytic amalgamation of gold and silver. Though there was at that time in existence, by the same inventor, an apparatus and process of the same general character designed for the electrolytic deposition of gold, silver, copper and other metals from streams of flowing solutions, this was probably the first practical process devised for that purpose.

Since that time there has come into use in Australia and South Africa an electric method of gold and silver precipitation from cyanide solutions, known as the Siemens-Halske process.

The existence of a process similar to that of Siemens & Halske, but which the writer believes is an improvement on that method, has not heretofore been introduced to general notice.

The electrolytic sluice, to which reference has been made, is an apparatus of a very compact form and comprises a number of metallic plates set in a rectangular box, the plates being nearly vertical and adjustable to very close proximities.

These plates are so electrically connected as to provide, alternately, anodes and cathodes throughout the series, the fluid to be treated passing into the sluice above the electrodes, then through the narrow channels between the electrode plates, where the metallic contents are deposited, and then into the launder below, where it passes off to be again used as a further solvent in other operations. A simple mechanism is provided to adjust the vertical angles of the electrodes, and, at the same time, to increase or diminish their proximities while maintaining their parallel relations.

A sluice containing sixty-five plates, each plate having about 2 square feet of surface, is capable of depositing the precious metals from 1000 tons of solutions per day with the expenditure of about 2 H. P. of electric current. There is considerable latitude in the conditions that may be observed, so that a much larger quantity than that above stated may be passed through the apparatus in the given time, if containing lower values, or the flow may be retarded when the metallic contents are greater.

The adjustment of the powers of deposition to the amount of metal to be deposited may be made by raising or lowering the current density on the electrodes, by increasing or diminishing the flow of solutions, or by increasing or lessening the proximities of the plates.

Thus a perfect control may be had to secure a thorough extraction of the precious metals and, at the same time, to exercise all necessary economy of current, which, if uselessly expended, leads to waste of cyanogen, as well as power.

The plates forming the electrodes, although easily removable for the purpose of removing the deposits, are made to be permanent parts of the apparatus, but should be in duplicate, so as not to interfere with the continuous working of the solutions. A few moments only being necessary to take out the plates and substitute the duplicates, and the manner in which the proximities of the electrodes may be adjusted to allow for the thickening of the deposits, enabling the work to continue for long periods without removal of the plates, makes the process practically a continuous one.

The electrodes are made of such metals as are best suited to the solution treated, and are selected to secure the smallest amount of corrosion possible of the anodes and a good conducting power of the cathodes, with surfaces that may be so treated that the deposits may be easily removed. Graphite offers some advantages in both these directions; but it is preferred when treating cyanide solutions to use iron as the anodes and copper for the cathodes of the process, the iron being treated to prevent erosion and the copper receiving a treatment that, though not preventing metallic deposition, yet allows the deposit to be easily taken from the plates.

As the capacity of this sluice, as stated, is at least ten times greater than that usually employed in the Siemens-Halske process, contains less than one-tenth of the electrode surface and demands no greater electric current, a reference to well known electrolytic laws and the presentation of some figures seems necessary to show that the results obtained are mainly owing to differences of construction and adjustments, and that the agencies employed in the electrolytic sluice are ample for the greater results obtained.

In similar electrolytes flowing between similar electrodes there are three conditions tending to increase or diminish the relative rate of deposition: 1. Current density. 2. Relative mass through which the current acts. 3. Proximity of the electrodes. When all other conditions are alike, the proximities of the electrodes and the relative mass are the conditions exerting the influence of the relative rate of deposit, provided sufficient current

density exists on the electrodes to produce deposition at the higher rate.

Now, if we have a flow of solutions between electrodes of 1 inch proximity, and having a rate of deposit of one grain per minute, and reduce the proximity to $\frac{1}{10}$ inch, we increase the rate of deposition ten times, by reason of the greater proximity, and ten times by reason of the lesser relative mass between the electrodes, so that we obtain a more rapid rate of deposition in the ratio of 10×10 (or 100 times) to 1 : or, as the relative mass is always decreased in the same ratio as the proximity is increased, we may say that the rate of deposition from a flowing electrolyte, when there exists ample current density on the electrodes, and ample metallic elements in the solution, is in inverse proportion to the square of the distance between the electrodes. So, therefore, it is possible that while by one method of adjustment only one grain will be deposited in one minute, another system may produce a deposition of 100 grains in the same period.

Now, taking Faraday's well known electro-chemical laws of deposition, whereby certain fixed densities of current produce, under proper conditions, certain fixed weights of metallic deposit, we will say, as being near the case, that one ampere of current exerted for one minute will deposit one grain of bullion composed of combined gold and silver.

Now, there is treated by the electrolytic sluice a flow of solution equal to the rate of one ton per minute, each ton containing 120 grains of bullion. This would require a current density, on the entire 64 square feet of cathode surface, of 120 amperes to deposit the whole 120 grains. But, possibly, there may be other reactions taking place in our apparatus which are unavoidable, such as the electrolyzing of a portion of the water, etc. For this we allow another 120 amperes, which gives as current expended 240 amperes at a tension, say, of six volts; this will equal 1440 watts, or about 2 H. P.

But we are yet largely within our powers, for a firm deposit may be produced with a current density of even five or six amperes to the square foot of cathode surface, while in our supposition we have employed but two amperes, and our flow has been at the rate of 1440 tons per day, while, if required, the flow may be diminished to one-half that rate. It seems to be generally overlooked that the thorough deposition of the metallic contents of a flowing solution does not altogether depend on the area of the electrodes as on the rate of flow of the solutions treated, but that it is the effect of an ample electric current properly imposed on electrode surfaces proportioned to the density of current required for the deposition of a given quantity of metal from a specific chemical solution brought under electrolytic control in a given time.

These conditions have been complied with in the electrolytic sluice to a larger degree than in the apparatus of Siemens-Halske; hence, the greater results obtained.

The processes of the electrolytic sluice may be applied to a number of purposes, and to those especially where rapidity and cheapness of extraction of any metal is required. A brief mention is here made of a few operations closely allied to those treated on above and coming directly within the scope of this article.

In the extraction of copper from low-grade ores, smelting may be impossible from its expense, as compared with the value of the metal obtained, or with ore of a higher grade the expense of treatment, combined with the cost of freight, may be prohibitive. It often occurs, under these circumstances, that by submitting the ores to roasting treatment, the insoluble sulphides may be cheaply converted into soluble sulphates which are easily leached, and the metal deposited from the solution, in the manner described in the gold and silver extraction processes, may be obtained so cheaply as to afford a good profit. The processes of the sluice are also valuable in the deposition of copper from such dilute solutions as may sometimes exist, as drainage from mines. In this case it deposits a pure copper at no greater cost than is incurred by the cementation method in producing a very inferior mixture.

As a means of deposition of silver from alkaline hyposulphite solutions this method also offers a cheap and rapid system of working, as compared with the chemical method of precipitation from such solutions, which occupies considerable time and occasions much loss in bringing the precipitate into the metallic form; while by the electrolytic method no loss is occasioned either in time or metal and the silver is produced in a pure state.

This method of treating silver is now being further extended by the discovery of more efficient solvents, by means of which silver ores containing but little lead may be worked without roasting. It is thought that these solvents may be so further improved that even lead-bearing ores may be treated by lixiviation without roasting, and that both the lead and silver may be recovered by electric precipitation. But, however this may be, the means afforded by the electrolytic sluice would seem to offer a means of relief to those miners having such silver ores not readily accepted by the smelters.

ROBERT BALL, professor of astronomy and geometry at the University of Cambridge, England, explained in a lecture on "The Cause of the Ice Age," delivered at Columbia University, New York, that the ice age was due to the influence of the planets Venus and Jupiter on the course of the earth's revolution around the sun and the change of orbit from a circle to an ellipse. He said also that there would be another ice age when Venus, Jupiter and the earth were in a certain position regarding one another. This, however, would not happen for several thousands of years.

La Fortuna Mine, Arizona.

[STAFF CORRESPONDENCE.]

Herewith is presented an illustration of La Fortuna mine and mill, Yavapai county, Arizona, owned and operated by C. D. Lane of California and associates. This property is in the Gila range, 16 miles south of Blaisdell station, on the Southern Pacific Railroad, and is a typical desert mine. The formation here is a limestone having a schistose structure, the bedding of the formation dipping southeast. The vein lies between strata of the country rock and has the same dip and strike. Between walls the ledge runs from 10 to 20 feet wide. The ore is a hard, white quartz, associated with quartz more or less broken by the decomposition of the pyritic minerals. It carries free gold, but no sulphides of any kind at the present depth of the workings. The free gold horns out and amalgamates readily, though apparently the ore contains a good deal that is flour fine, the saving of which depends upon the cyanide work.

A two-compartment incline shaft sinks on the vein to 1000 feet depth, with levels run on the vein from 100 to 500 feet each at the 100-foot stations. The mine has been worked about five years and a considerable portion of the ore has been stoped out above the seventh level. Most of the present production, however, comes from the stopes above the 500-foot level. The stopes are timbered up with square sets. In one of these, on the eighth level, a face of ore appears that stands about five sets high, running from wall to wall. A little below the eighth level the ore body was lost by reason of a break or fault in the formation. The incline was continued to 1000 feet, where a station was cut and prospecting levels and crosscuts run therefrom in search of the ore. From this 1000-foot level two incline winzes, pitching in opposite directions, have been sunk, each 200 feet deep, and the two connected at the 1200 by a 400-foot drift. The underground work in the mine aggregates at least 7500 feet.

Fortuna Mine and Mill, Fortuna, Yuma County, Arizona.

Two skips are operated in the main incline by a double-drum steam hoist, and a skip is operated in each 200-foot winze by compressed air.

The mill is equipped with twenty stamps, weight 1425 pounds each, dropping eighty-two to the minute, the material passing from the mortar through 50-mesh screens. Below the usual plates for amalgamating at each 5-stamp battery the pulp passes to a second system of similar plates on a lower floor. It is claimed that in this way 75% of the saving is made on the plates. The tailings pass to a pond at a lower level and are treated in a cyanide plant comprising five 150-ton leaching tanks and the usual rig for precipitation. The stamps mill about seventy tons of ore daily.

Ironwood timber is used for fuel and water for mill work, the cyanide tanks and domestic purposes, is pumped 16 miles through a 4-inch pipe to storage tanks near the mine. The well and pumping station are near the railroad. About ninety men are employed at mine and mill, besides a number in other work. F. J. Martin is Supt., H. C. Haupt assistant and J. Golden mine foreman.

Fortuna, Dec. 31, 1901.

Notes on Protection of Metal Work by Asphalt Concrete.*

By W. H. FINLEY.

About eight years ago the railroad company I am with had occasion to put in a bridge in the city of Rockford, Ill. The city insisted that the floor be made watertight, and I decided to put in a solid ballasted floor and to protect it by covering the troughs 2 inches deep with asphalt mixed with sand in the proportion of about 1 to 1. Recently it was necessary to renew the ties and the gravel ballast that was put in on top of this asphalt, and occasion was taken to make an examination of this asphalt covering. The California asphalt used did not contain coal tar or any of its products. There was found considerable life and elasticity to it after eight years of service. It was, in fact, almost as good as on the day it was put in, and the trough was absolutely as dry and well preserved as on the day it was put in.

I thought, in view of the fact that a number of bridges are being erected in the city, which it is necessary to make watertight, it would be of interest to some of the members to know of our experience with ballasted floor bridges protected with asphalt covering. We have, since the bridge in question was put in, used quite a number of ballasted floor bridges, using pure asphalt only, mixed with sand, and I am satisfied that it is entirely practicable to protect an ordinary ballasted floor bridge so that there will be no deterioration of the iron or steel. This particular bridge has been absolutely watertight during all these years. It is situated over Main street, in Rockford, Ill., and if there was any leakage we would have heard of it very promptly.

I believe all the asphalt compositions used in Chicago contain either coal tar or its products, and in cold weather the concrete cracks and permits the entrance of water between the covering and the iron, with a consequent rapid deterioration of the iron.

I have found, in my experience in applying asphalt to metal bridges, that it was absolutely necessary to have the iron clean as far as grease and dirt are concerned, and that in no case should the iron be damp, cold or chilled. If hot asphalt is put on iron, wood or stone where there is any moisture, it will peel off and will not adhere, so that, in all cases where it has been applied in cold weather, we have had to beat sand and spread it over the iron work to take out the chill. In summer time the sun is usually hot enough to heat the iron, and artificial heat is not necessary. In one case, where we had to take up a subway covering that leaked, we found that it had been applied without first drying off the stone. After the covering was removed, the stone and metal work was cleaned and heated and a new covering of asphalt put on.

The cost is not excessive. Of course, after you have once made up your mind as to whether you will put in a solid floor bridge or an open floor bridge, the extra cost of this protection is a small amount compared with the total cost. There is no question but that the solid floor bridge costs more than the open floor bridge. I am inclined to think that from now on we will see more solid floor bridges than in the past. Unquestionably there is a great saving in maintenance on all small structures. They do not require a bridge crew, as the ordinary section man looks after them. The asphalt was found adhering to the iron-work. It was quite difficult to remove, even with a cold chisel; practically no pressure was put on in applying it; it was put on very much as you would put on an ordinary street paving of asphalt. We first cleaned the iron off as well as we could. We then spread hot sand over the iron to warm it, and then painted over the exposed surfaces with pure California asphalt; then we put in this composition of sand and asphalt and ironed it out with a hot iron.

*Journal of Western Society of Engineers.

Solutions.

By A. A. Watson.

When we put a piece of sugar in water, what becomes of it? It dissolves. But what is solution? It is not a mere mixture of fine particles, for if we take a microscope and examine a drop of the solution of sugar we do not see any small particles of sugar. So far as can be seen, the water is as clear as before, yet we know hy the sweet taste of the liquid that the sugar is there. It is in solution. What the condition of solution is has not even yet been placed heyond dispute, hut the theory which has obtained the greatest amount of credance is that the particles of a solid, when placed in a liquid in which it is soluhle, keep getting smaller and smaller, until at last they are separated into their molecules. These molecules in solution are then in the same condition as the molecules of a gas. They are separated from each other, they influence the vapor pressure of the liquid they are dissolved in, and they exert a pressure on their own account which is sometimes very considerahle and can he accurately measured. Another theory which has some supporters is that solutions are composed of the dissolved suhstance with the solvent. It has heen pointed out that when sulphuric acid is mixed with water heat is evolved, proving that a chemical compound is formed. No douht this is true in this particular case, and the prohahility is that the first theory is wholly, and the second partially, true. To understand the solution of a solid in a liquid it is necessary first to understand the state of solution of gases in gases. Gas mixes in all proportions. Their molecules are free and ahle to move ahout in any direction. If two gases are hrought together they continue to mix until a uniform mixture is ohtained. If we take a flask full of heavy carhonic acid gas and invert a flask full of hydrogen over it, taking care that the openings of the flasks are fitted tightly to each other, in a few days carhonic gas will he found in the upper flask and hydrogen in the lower, although hydrogen, until a few years ago, was the lightest gas known to science. The molecules of gas are always in a state of rapid motion, and therefore when two gases are brought together the molecules of one soon penetrate those of the other and in time complete mixture is the result.

Gases are generally soluhle in liquids. Their soluhility depends upon pressure and temperature. The greater the pressure on the gas, and the lower the temperature of the liquid, the more gas will he dissolved. In the liquid condition, however, the molecules are closer together than in the gaseous condition, and for this reason the solution of a gas in a liquid is not so complete as the solution of a gas in another gas, and the thicker the liquid the less gas it will absorh. Mercury, for example, which is nearly solid, ahsorhs very little of any gas—indeed, so little that the quantity is difficult to measure.

Liquids, like gases, dissolve each other, hut to not nearly the same extent. The molecules of a liquid are nearer each other than those of a gas, and not so free to move ahout. For this reason some liquids will not mix at all, or only to a very slight degree. Ether and water, for example, will not mix, and neither will water and petroleum. Water and alcohol, on the other hand, mix completely.

Having considered the solution of gases, a case in which the molecules are widely separated, the solution of gases in liquids where the molecules of the gases are free, and in the liquids only partially so, and the solution of liquids in liquids, where the molecules are only partially free, we come finally to the solution of solids in liquids, a case in which the molecules of the one are partially free, and of the other tightly packed together. It is needless to remark that the soluhility of solid suhstances in liquids is very limited. Metals, however, dissolve in some acids, and many organic substances dissolve in water and other neutral liquids. When a layer of water is placed over a soluhle salt, the salt hegins to rise against gravity and to diffuse in it, the motion only ceasing when the suhstances are uniformly distrihuted throughout the whole mass of water. This motion may be arrested hy bringing hetween the solution and the solvent a septum which will let the solvent through, but not the dissolved substance. A semi-permeahle wall of this kind can he prepared by saturating a porous earthenware cell with a solution of copper sulphate, and then filling it up with a solution of potassium ferro-cyanide. A precipitate of copper ferro-cyanide is formed on and within the earthen wall through which water, hut not sugar solution, can he filtered. If we fill such a cell with sugar solution and connect it with a marometer to measure the pressure, and place it in pure water, we obtain an increase of pressure. A solution of sugar of 1% gives a pressure equal to 50 cms. of mercury. This pressure is called "osmotic pressure," and the laws governing it are the same as for gases, the pressure heing proportional to the concentration of solid in the liquid. It has been found hy calculations based upon the molecular weight of sugar, that the osmotic pressure of a sugar solution has the same value as the pressure that the sugar would exercise if it was contained as gas in the same volume as is occupied hy the solution. This is an important point and sheds a light upon the condition of solid suhstances in solution.

Solids, when dissolved in liquids, lower the freezing point proportionally to their molecular weight. For example, if a suhstance called A has twice the molecular weight of another substance called B, an equal weight of A will lower the freezing point of a liquid twice as much as an equal weight of B. The vapor pressure of a liquid is also lowered according to the same rule when a solid suhstance is dissolved in it.

When a compound of a metal with an acid, as, for example, sodium chloride or zinc chloride, is dissolved in water, not only are the fine particles of the salt resolved into their molecules, but these molecules themselves are resolved into their primary elements. It has heen found that the osmotic pressure and the lowering of the vapor pressure and freezing point of water, where metallic salts are dissolved in it, are twice as great as expected from the molecular weight of the salts. From this it follows that there must be twice as many molecules, and, therefore, instead of one molecule of zinc chloride, there must he one molecule of zinc and one of chlorine. Another proof of this fact is that if we evaporate a solution containing sodium chloride and magnesium sulphate slowly, at ordinary temperatures, sodium sulphate and magnesium chloride separate out instead of the original salts. From this disassociation of metallic compounds into their elements in solution we get our galvanic hattery. When a solution of copper sulphate is made the sulphur, combined with oxygen, disassociates from the copper; now when a piece of zinc is placed in the solution, the zinc begins to combine with the sulphur oxygen, to form zinc sulphates copper precipitates, and when a circuit is made a galvanic current is evident.

We see, therefore, that the solution of a solid in a liquid is a continuous process of extremely fine division, the process heing continued down to the molecules themselves, and, in the case of metallic salts, down even to their primary elements.—The British Columhia Mining Record.

Oxygen and Hydrogen Gases by Electrolysis.

The production of oxygen and hydrogen gases hy the electrolysis of the water of solutions of caustic alkali has now become a successful suh-branch of electrochemical industry, and at Rome, Milan, Zurich, Lucerne, Hanau, Brussels and Paris installations of this kind are in operation. Several different forms of apparatus have heen devised for carrying out this decomposition of water and separation of the gases liherated. A recent one, the Schuckert electrolyzer, consists of a cast iron tank containing a large number of iron hells, one of these latter heing used to cover each electrode and to collect the gas liherated at its surface. A 15% solution of caustic soda is used as electrolyte, and a continuous inflow of distilled water is required to replace that decomposed hy the electric current. The hest efficiency is ohtained with this apparatus at 70° C. (126° Fah.) with an electromotive force of 2.8 volts, and in order to guard against loss of heat the electrolyzer is emhedded in a wooden hox filled with dry sand. Ruhher tubing is used to conduct the gases from the "bells" to the gas holders, ruhher heing used to prevent short-circuiting hetween the latter and the cell. A Schuckert electrolyzer of normal size is 26 inches in length, 18 inches in hreadth and 15 inches high, and requires for charging 13.20 gallons of sodium hydrate solution. With a current of 600 amperes this electrolyzer produces per hour 7 cubic feet hydrogen and 3.5 cuhic feet oxygen, measured at 15° C. and 30 inches pressure. Using power costing 1 cent per kilowatt hour, oxygen and hydrogen would cost together ahout $1.30 per 1000 cuhic feet. The cost of compressing either gas for storage in cylinders would double this amount, making the total cost to the user ahout $2.50 per 1000 cubic feet. The use of hydrogen gas, in gas engines of special design, as a motive power for automobiles, is likely to receive practical study, now that a supply of the compressed gas at low rates is at the command of engineers.—The Electrician.

Increasing U. S. Silver Coinage.

The House Committee on Coinage, Weights and Measures have reported favorahly a bill providing for the maintenance of the legal tender silver dollar at a parity with gold, and for the increase of the suhsidiary silver coinage. The bill authorizes the coinage of suhsidiary silver coin without regard to limit and as puhlic necessity may require. The most important feature of the hill for the parity of gold and silver dollars is as follows:

"The Secretary of the Treasury is hereby directed to maintain at all times a parity with gold the legal tender silver dollars remaining outstanding, and to that end he is hereby directed to exchange gold for legal tender silver dollars when presented to the Treasury in the sum of $5 or any multiple thereof; and all provisions of law for the use or maintenance of the reserve fund in the Treasury relating to United States notes are, in the discretion of the Secretary of the Treasury, herehy made applicahle to the exchange of legal tender silver dollars."

Some Mine Data.

In his report of the past year's work of the Lincoln G. M. Development Co., Sutter Creek, Amador Co., Cal., Supt. E. C. Voorhies gives some interesting data concerning mine costs. He says:

When we started to sink the shaft below the 1200 level we installed the Baby Giant drills, and the following is a comparison of cost hetween shaft sinking with power drills and hand drilling.

Cost and time for sinking 450 feet of shaft hy hand drilling from the 800 to the 1250 levels (dimensions of shaft 8x17 feet) was as follows:

Twelve miners, 304 days at $2.75 per day, eight-hour shifts	$ 9,424 00
One foreman, 304 days at $4 per day	1,216 00
Total cost of labor for sinking 450 feet shaft by hand drilling	$10,640 00
Average cost of labor per foot	23 64

Cost of sinking 477 feet of shaft with Baby Giant drills was as follows:

Nine miners, 208 days at $2.75 per day, eight-hour shifts	$5,147 00
One foreman, 208 days at $4 per day	832 00
One night foreman, 164 days at $3.25 per day	533 00
Premium given for extra work	94 50
Total labor cost for 477 feet	$6,606 50
The average cost per foot	13 00

The above figures include all the lahor of timbering.

Cost of lumber per foot of timbered shaft	$ 5 27
Cost of powder per foot of shaft	1 82
Cost of caps per foot of shaft	06
Cost of fuse per foot of shaft	16
Cost of candles per foot of shaft	34
Cost of extra parts for power drills per foot	36
Cost per foot of shaft not including power or top expense	21 96

In the month of June we installed an oil-burning apparatus in place of wood for fuel. We erected a 1200-barrel redwood tank 160 feet north of the hoisting works; and the same is connected with the hoilers with a 4-inch pipe line. The comparison hetween pine wood and Bakersfield crude oil for fuel during the year has heen as follows:

From January 1st to July 18th (six months, eighteen days), we hurned 602 cords of wood at $6 per cord, which would equal $3612.

From July 18th to January 1st (five months, twelve days), we used 1460 harrels of oil at $1.50 per harrel, making total cost $2190.

Average cost per month for wood	$547 27
Average cost per month for oil	404 55
Savings per month	$142 72

The following is a detailed statement of the work done at the mine from January 1st to Decemher 31st, 1901, showing the gallons of water, tons of waste hoisted, hlasting holes drilled, etc.

14,925,800 gallons (55,822 tons) of water were hoisted from the mine during the year.
9,953 tons of waste were hoisted from the mine during the year.
6,219 tons of water were hoisted from the mine during the year.
16,172 total tonnage during the year.
3,004 blasting holes were drilled in the different levels from Jan. 1st to April 1st.
2,810 blasting holes were drilled in the sinking of the shaft.
244 blasting holes were drilled in the crosscut for 1600 dam.
34 blasting holes were drilled in the repairing of shaft.
6,092 blasting holes were drilled in the mine during the year.

Seventeen thousand eight hundred pounds of dynamite, seventy-one hoxes of caps, sixty-three 40-pound boxes of candles and 49,100 feet of fuse were used during the year; 602 cords of wood were hurned from January 1st to July 18th; 1460 harrels of oil were burned from July 18th to December 31st. The compressor ran 2875½ hours during the year. The engineer made 40,338 trips with water, waste, timhers, men and empty skips. From May 1st to Decemher Decemher 31st ninety-five sets of timher, 400 feet of air pipe, 432 feet of compressed air pipe, 380 feet of permanent ladder and 450 feet of permanent track were put in place. Total distance of drifts and crosscuts run from January 1st to April 1st, 691 feet; 583 feet of diamond drill work was done during the year. Average number of men employed during the year, twenty. All the buildings, machinery and tools are in good condition. Rainfall from January 1st to December 31st, 1901, 20.06 inches.

Platinum in a paying quantity has heen discovered in the Dry Diggings District, Jackson county, Or. The metal occurs in small grains or flakes. Many placer miners in southern Oregon have found it in quantity in their sluices, but have thrown it away, heing ignorant of its identity and value. Serpentine, the rock source of the platinum, is a predominant formation in Josephine county, more especially in western Josephine. All the streams draining this section are platinum producers.

Process for Welding Copper and Steel or Iron.

For some time it has been the custom of providing sledges or hammers with copper faces which, being soft and yielding, do not injure the metal upon which they are used. A new method of putting these faces on the hammer has recently been discovered by Comley Bros. of Braddock, Pa., who patented it.

It is essential that the iron or steel before welding the copper or brass should be thoroughly freed from scale or rust, which may be done by any method in practice. The body portion of hammer or other tool to be united to the copper face being placed in a receptacle, such as a black-lead crucible, in which it may be subjected to the temperature in the fire or furnace, the body being properly covered to prevent the iron or steel from oxidizing. The receptacle or crucible is heated until the temperature of the iron or steel body is raised to nearly the melting point of the copper. At the same time a sufficient quantity of copper is placed in a vessel or crucible in the fire or furnace and melted. While in the molten state the scum or impurities are gathered. The copper being melted and the hammer body being now ready to be united, the two receptacles or crucibles are taken from the furnace and the hammer body is quickly removed from its enclosure, and that part which is to be welded to the copper is immediately plunged into or immersed in the molten copper. A small portion of lead sufficient to cause the copper to solidify is dropped into the crucible, or the lead may first be melted and poured into the vessel containing the molten copper, usually about one-fourth of an ounce of lead to one pound of copper. By putting the quantity of lead into the vessel after the hammer is placed in the molten copper the volatilization of the lead frees any sulphurous acid gas from the copper, and the copper is purified and solidified. Charcoal and sand or other heat-retaining medium may then be placed over the welded mass, so as to prevent too sudden cooling and allow the molecules of the two metals to unite more firmly. Thus covered the welded copper-faced body is allowed to gradually cool. As soon as the copper is solidified and cooled to the desired temperature the welded compound body may be removed from the crucible and at once rolled or shaped into any form or may be stacked for further treatment.

In making a brass or bronze face weld an alloy is prepared, which may consist of two parts tin, one part zinc, one part lead, and from two to fourteen ounces of copper. The zinc, lead and tin, melted and alloyed, are poured into the receptacle immediately after the hammer body is placed into the molten copper, and the whole may then be covered up with charcoal and sand or other heat-retaining medium.

In preparing the body portion of the hammer for welding to the copper face, the part to which the copper is to be welded is niched or roughened, so as to provide an irregular surface which will give the molecules of the copper and steel a better opportunity to lock and unite similar to the welding of two pieces of iron at the blacksmith's forge.—American Manufacturer.

A New Denver Mining Machinery Plant.

Herewith is illustrated the new plant of the F. M. Davis Iron Works of Denver, Colo., one of the largest manufacturers of mining and milling machinery between Chicago and San Francisco. About two years ago this company had a disastrous fire, completely destroying their old works. The plant as now rebuilt is modern in every respect, covering an area of about four acres, with a total floor space of over 70,000 square feet. The different departments are well equipped with the most modern machine tools, driven by electric motors and commanded by electric and pneumatic cranes. At present the company employs about 300 men, with a yearly output of over half a million dollars. Their product is exclusively machinery for the mining, milling and smelting of ores.

Some Occurrences of Gases in a Quicksilver Mine.

Written for the MINING AND SCIENTIFIC PRESS by PHIL REARDEN.

While mining quicksilver ore in an old mine in California a short time ago, I noted some exceptional occurrences, and got enough gas experience to satisfy an ordinary miner, for a short time at least.

We were doing a lot of development in an old mine which had already about 7000 feet of levels and winzes. In the first case we drove a crosscut drift about 200 feet from a vertical shaft to cut the vein. We had artificial ventilation, a 16-inch fan with 10-inch galvanized iron pipe (supposed to deliver theoretically 1500 feet of air per minute at end of the pipe), which was always kept as near the breast of the drift as possible—ordinarily about 20 feet. The end of the pipe was protected by timbers when firing the shots.

In the country rock, which was sandstone and shale, we had no trouble, but when we struck the vein it was different. The vein matter was serpentine, in which occurred the cinnabar. The width was about 10 feet and it contained a large number of fissures and openings from the width of a knife blade to 6 inches. All these openings contained both water and gas; so, in addition to the gases, we were continually striking large flows of highly mineralized water.

The first shot into the vein brought a large flow of water and four kinds of gases, viz.: Carbonic acid gas, CO_2; inflammable marsh gas, CH_4; sulphuretted hydrogen gas, H_2S; chlorine gas. A combination of all called by the miners "sore eye gas," from the fact that after from four to six hours' contact with this gas their eyes were affected very similar to snow blindness, was very painful and took from two to four days from which to recover.

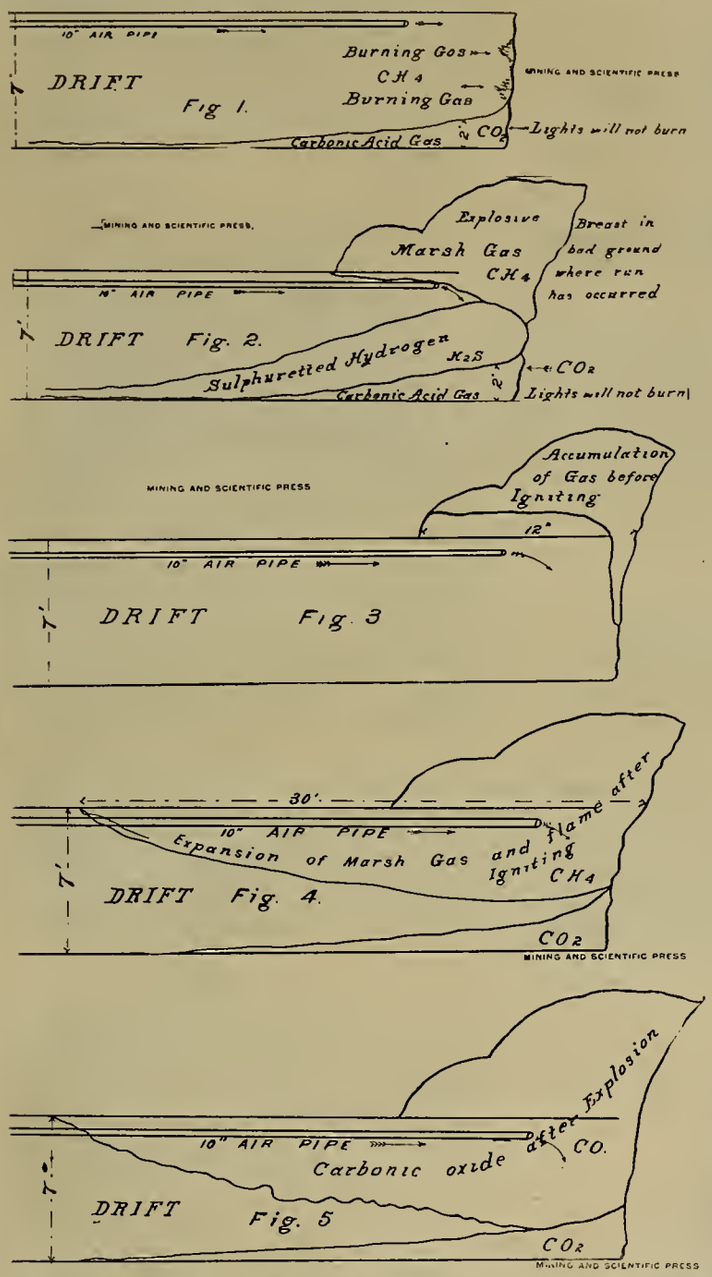
As there was a large amount of soda and sulphuric acid in the water, the result was an unusual amount of carbonic acid gas, which came with the water from the floor, the sides and the breast in such quantities, and being heavier than air, that no lights would burn within 2 feet of the floor at the breast, extending back 20 to 30 feet, and gradually disappearing along the floor and ditch.

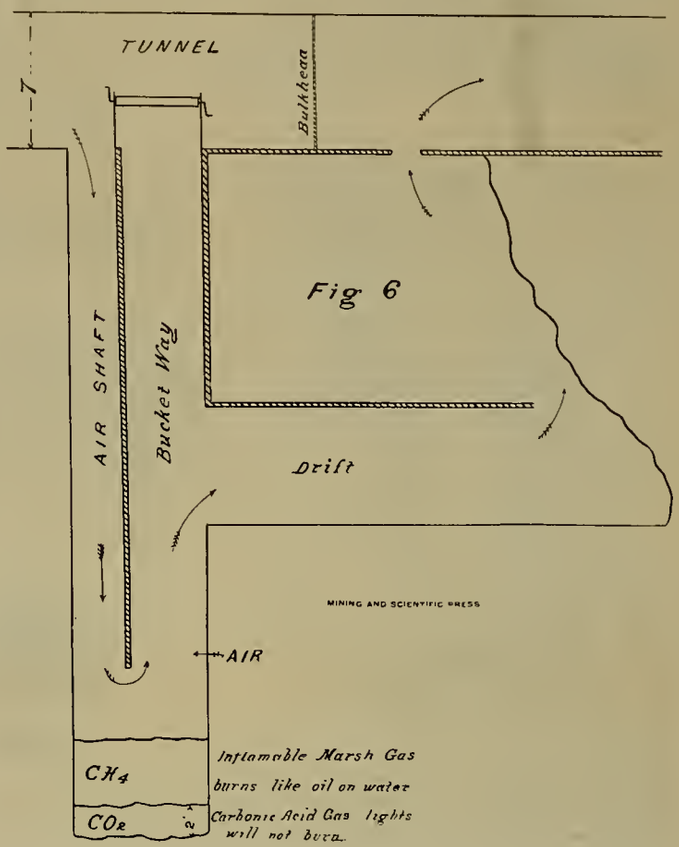
The next troublesome one was the marsh gas, which also came in with the water, and, being lightest, immediately raised to the top of the drift and formed in the cavities that would occur above the timbering along the roof. It came in such quantities that our air supply could not dilute it fast enough when in these cavities. The consequence was that we had to burn it out or explode it frequently to prevent its accumulating in large quantities and from exploding from contact with the lights—candles—when we were not prepared for it.

We also partially prevented large accumulations by keeping the gas lighted and burning where it escaped from the fissures in the breast. These were kept burning at all times; and immediately after firing a round of shots a miner would go back to the breast and hunt up the fissures and re-ignite them before any large amount of gas formed overhead. Imagine the consternation of a new miner when first he went in here to work on seeing these flames burning in the breast! Of course, we had some men pretty badly burned, the writer being one of them, but no serious accident occurred.

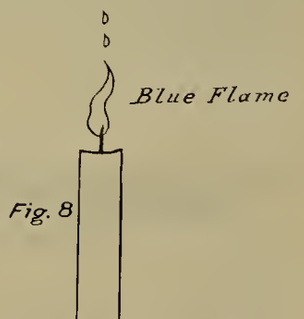
There being a large amount of sulphur and iron in the water, the result was sulphuretted hydrogen in quantities too large to suit, and, being semi-inflammable and also good for asphyxiation, was another menace; also, on account of its odor, was not at all desirable. The water, which was not hot, but of nice temperature for drinking, contained magnesia, salt, soda, sulphur, lithia, lime, iron, mercury, silica, niter and a lot of other elements too numerous to mention here.

See diagrams illustrating the actions of the gases in the mine. Fig. 1 represents the theoretical and actual condition in the level, showing flames or jets of gas burning in the breast and carbonic acid gas along the floor. Fig. 2 represents the theoretical condition where a run occurred in the mine and left a large cavity overhead, showing position occupied by inflammable marsh gas in top of cavity, next below the semi-inflammable sulphuretted hydrogen gas, and below that the carbonic acid gas along the floor. Fig. 3 represents the theoretical condition of a small body of marsh gas in cavity near roof before igniting or exploding. Fig. 4 represents the theoretical and real conditions of the expansion of marsh gas at instant of igniting or exploding. Fig. 5 represents the theoretical and real conditions of increase of carbonic oxide gas immediately after the explosion, consequently it was very unsafe for the workmen near the breast for some minutes after the explosions. Fig. 6 represents the theoretical conditions in a shaft or winze which we sunk from a tunnel floor, and from which we were underhand stoping at the side.

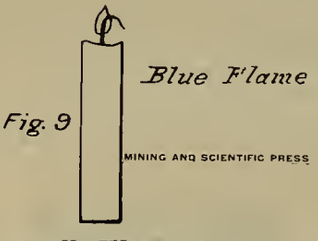




Candle Flame where no Inflamable Gas exists.



Candle Flame in presence of Inflamable Gas.



Candle Flame in presence of Carbonic Acid Gas.

There was a tight brattice in the shaft between the bucket and manways. This caused the air to pass down the manway and under the brattice, partially clearing the bottom of the shaft and passing

through the stope to the tunnel floor again and thence to other parts of the mine.

In this shaft the carbonic acid gas would form about 2 feet deep on the bottom and lights would not burn; but on top of it, and next to the current of air at the bottom of the brattice, there would form enough partially diluted marsh gas to burn when ignited for about ten minutes, just like oil on water. Two of the miners, while passing under the brattice, concluded to look into the bottom of the shaft, about 10 feet below, and one lowered his candle a little too far, the result being there was an explosion and both were severely burned.

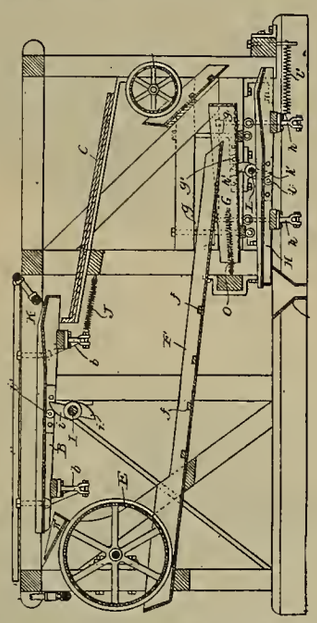
We found it necessary always before going into this shaft to work to burn out the gas by tying a rag saturated with kerosene to a wire and hanging it in the shaft.

Mining and Metallurgical Patents.

Patents Issued January 7, 1902.

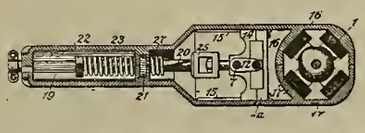
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

GOLD SEPARATING MACHINE.—No. 690,791; B. W. Sweet, Denver, Colo.



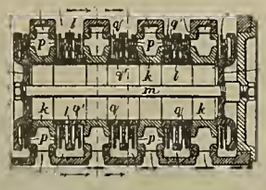
An inclined concentrating table, and means for operating it, amalgamating surfaces at each end of table for receiving heavier and lighter grades respectively, a lower inclined concentrating table, sizing screens located above lower table for separating out heavier grades and discharging lighter concentrates with a fall sufficient to submerge them on the lower table, means for operating lower table and screens, and means for discharging material passing from amalgamating surface which treats lighter grades into sizing screens.

ROCK DRILL.—No. 690,687; A. M. Ballou, Denver, Colo.



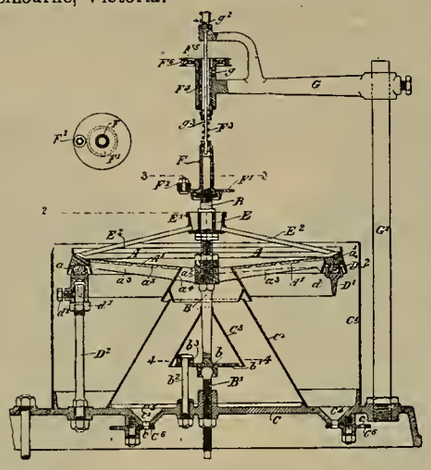
An electro-mechanical rock drill, consisting of a driving wheel 6, having holes, a disk provided with loose tapered keys and with springs holding keys in holes, a shaft, upon which wheel is loose and upon which disk is mounted with friction rolls for permitting rotation in one direction and not in other, a crank upon shaft, a plunger for holding a bit, a crosshead movable to and fro and connecting crank to plunger, means for rotating plunger during its longitudinal movement, a spring acting to drive out plunger and adapted to be compressed by turning of crank, a link 25 connecting crosshead to plunger, and a spring 27 in front of link to act as a cushion.

ARRANGEMENT OF VALVES FOR PUMPS, ETC.—No. 690,879; F. W. Rogler, Budapest, Austria-Hungary.



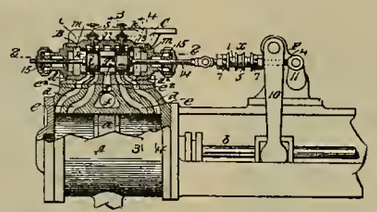
A casing, and partitions in casing having central openings therethrough; a series of disks fitting in openings, said disks having recesses in their peripheries, ports opening through their sides into recesses, collars between disks, stop disks on collars, valves arranged between ports and stop disks, and flexibly connected to latter, and means for binding disks and collars together.

APPARATUS FOR SIFTING PULVERIZED ORES OR THE LIKE.—No. 690,731; W. Jamieson and F. J. Odling, Melbourne, Victoria.



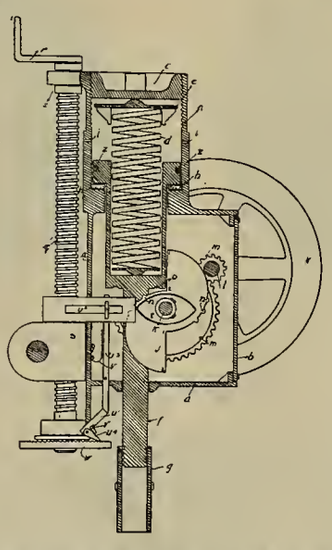
The conically dished sifting or sizing appliance A A′ provided with a central discharge a^4 and with a peripherical feed appliance, central spindle B provided with pivotal cup h and flange h′ at its lower end, weighted rotating disk F′ F^2, flexible shaft F^3, disk driving spindle F^4, dish seating cushion D supported in an adjustable ring D′, the spherical headed adjustable bolt B′, the holding bolts h^2, rubber washers b^3 between bolt heads and disk, and bed plate C.

STEAM PUMPING ENGINE.—No. 690,545; C. C. Worthington, Irvington, N. Y.



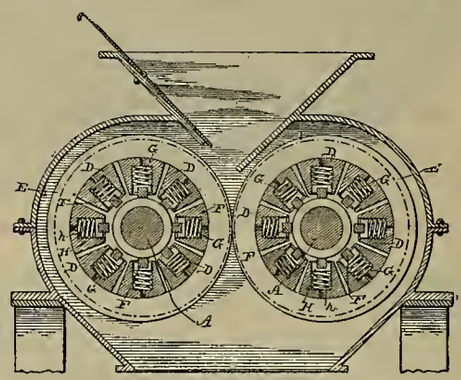
A duplex piston valve steam chest adapted to be secured to a duplex steam cylinder construction in place of a duplex D or other side valve steam chest and provided with separate admission and exhaust steam ports controlled by piston valves and adapted to register with and form extensions of cylinder steam ports and having dash relief valves controlling passages connecting admission and exhaust ports.

ROCK DRILL.—No. 690,630; A. C. Bates, San Francisco, Cal.



A machine casing having a front and a rear chamber, front chamber containing a main shaft and a cam wheel and gearing for movement of a balance wheel attached to countershaft, a plunger for working of a drill operating through same, plunger consisting of a shaft provided with a collar for holding a drill and having a recess in its rear end for holding a spring for driving plunger forward, plunger at the mouth of recess having a flange or head presenting a straight surface to inner sides of rear chamber and slidable against sides, front wall of rear chamber having an opening for operation of rear section of plunger therein and inner surface of wall being inclosed by expansible packing so as to prevent escape of compressed air from cushion thereof formed on release of spring, between lugs and packing opposite thereto, rear chamber having vents in its sides and rear wall consisting of a threaded cap adjusted to opening of rear chamber for shortening of spring as may be desired, in combination with a cam wheel having two parts for successively forcing back plunger compressing spring and suddenly releasing it, and having spurs on rim to act in conjunction with the pockets in plunger opposite thereto for turning it, a cam adapted to act upon and release a feed attachment provided with a pawl arranged to engage teeth of a ratchet wheel attached to a feed screw for forward movement of machine, feed attachment consisting of a centrally pivoted bar, a rectangular block having a slot, a thumb screw securing block to bar through slot bar having an angular branch and pawl being pivotally connected therewith.

CRUSHING MILL.—No. 690,534; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Newton Center, Mass.



Two end heads C, C, having inwardly projecting peripheral flanges c, c, a circular series of weights overlapped by flanges, a series of pins or bars held in place by heads and engaging weights to retain them in proper position, a tire encircling weights which is loose relative to roll shaft, and springs for yieldingly forcing weights outward against inner face of tire to maintain weights normally in position to balance roll.

PROCESS OF OBTAINING METALLIC LEAD FROM LEAD ORES.—No. 690,520; A. Germot, Asnieres, France.

Blowing air through a mass of molten sulphide of lead containing silver or other metals, condensing without contact of external air fumes of sulphide of lead which separate from mass, introducing condensed fumes into a mass of lead or of lead and sulphide of lead containing no silver or other metals and blowing a current of air therethrough.

Revision of Mining Laws.

Senator Stewart has introduced the following three proposed amendments to the mining laws of the United States: One is to amend Chapter 6 of Title 32 of the Revised Statutes, so that the date of the expiration of mining locations shall be Oct. 1 of each year, instead of Jan. 1, and provides that where the annual assessment work has not been done the original locators can not relocate the ground without immediately commencing and prosecuting diligently to completion the required assessment work.

Another mining bill is designed to prevent the monopoly of mineral land by providing that no person shall locate a mining claim as agent or attorney for any other person, association or corporation. The third mining bill provides for the repayment to the miner or mining company of unexpended moneys to cover the costs of platting and office work in connection with the patenting of claims.

THE value of mineral products in the United States in 1900 exceeded for the first time the billion dollar mark, according to the Geological Survey report on mineral resources. The figures were $1,067,603,636, as compared with $971,900,894 in 1899, a gain of $95,702,712, or 9.85%. Iron and coal yielded over half of this total, their combined value being over $566,000,000. The most important gains in gold production were in the Seward peninsula of Alaska, the Cripple Creek district of Colorado and in Arizona. The yield for the year is valued at $79,171,000, a gain of $8,117,600 over 1899. The silver output was of the commercial value of $35,741,140. The crude petroleum production exceeded all records, the large increase being especially noted in West Virginia, California, Ohio, Indiana and Texas.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The owners of the Boston King group of quartz claims at Salmon creek, near Juneau, have incorporated the Alaska King G. M. Co. to operate it. The group consists of eight quartz claims, upon which several thousand dollars' worth of work has been done during the past two years, consisting of a crosscut tunnel, drifts, dam, water flume and ditch, by which, with about 3000 miner's inches of water from Salmon creek, the surface has been hydraulicked to trace the lodes. In this manner two good lodes have been uncovered, one of which is 12 feet and the other 16 feet wide. The owners are J. Wagner, C. Goldstein, H. H. Folsom, L. Goldsberg and N. Wagner, all of Juneau.

The report of the Alaska United mine for the month ending Dec. 15 shows 18,455 tons ore crushed, of a value of $17,037, and 525 tons sulphurets, of a value of $17,737. Total receipts for the month, $38,810; expenses, $26,909. Average of ore, $2.10 per ton.

KOYUKUK.

Koyukuk advices state that a great stampede from Dawson and Nome to Koyukuk in the spring is indicated by miners from those camps who are rushing in this winter. B. Barton writes from Bettles City that gold is found at a depth of about 4 feet. The first stratum is gravel and then comes slate bedrock, where the paystreak lies. The wages range from $1 to $1 25 an hour, but almost every one is working for himself and it is hard to get help. Logs for houses are bought and sold for $6 each. There were only 150 people in the entire Koyukuk country last spring, but there are 300 now. There are four saloons, one bakery and two restaurants there. Flour is selling at $7 per sack, sugar at 20 cents per pound, caribou or moose meat at $1 per pound, overalls for $2 50, rubber boots at $15 a pair and tobacco at $2 a pound. There is a great scarcity of goods of all descriptions in the country.

NOME.

J. Gropper and E. Hamman of Seattle, Wash., last summer discovered tin in the vicinity of Cape York. They have bonded their claims to W. M. Curtis of Detroit, Mich. The proposition is said to be a placer one, the tin being saved by sluicing. It is proposed to ship the ore to the United States for reduction.

VALDEZ.

W. S. Amy of San Francisco, one of the late owners of the Bonanza group of copper mines in the Chisna district, states that the new owners will immediately begin the work of developing the properties and commence during 1902 the construction of the railroad from Valdez to the mines, a distance of 150 miles.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The property of the Black Diamond Copper M. Co. is on the eastern slope of the Dragoons, 9 miles west of Pearce. The group covers a mineralized ledge running with the trend of the range. It is well opened up through several tunnels, some of which are crosscuts and other going in on the ledge. Work demonstrates that the width between the walls is over 100 feet, within which are shoots of ore said to be about 20 feet wide. The ore consists of an iron and copper sulphide, which Manager N. O. Bagge states will run 5% to 7% copper, carrying also good values in silver. In fact, the mine was first opened and operated several years ago as a silver mine. The ore body is in a contact between lime and porphyry. Equipment is partly on the ground for the construction of a smelting plant, which will include a 44x120-inch furnace of 200 tons capacity, and a cupola furnace, 38 inches diameter, for resmelting the matte. These and other machinery are being furnished by the Allis-Chalmers Co. A 1½-mile aerial tramway will be erected to deliver the ore from the mine to the smeltor, there being a difference in elevation of 800 feet between the two. The necessary power plant will use fuel oil. The smelting plant will be enclosed in a 76x190-foot steel structure. Water will be conveyed to the plant through a 3½-mile pipe line from springs, which, it is claimed, will furnish an ample supply. The officers of the company are Frank H. Crockard of Wheeling, W. Va., J. G. Hearne, James A. McBain, N. O. Bagge and Frank C. Hoffman.

Pearce, Jan. 9.

F. Powers has sold his World's Fair mine, in the Harshaw district, for $50,000 to J. Brockman of the Commonwealth M. Co. of Pearce. The mine is reported to be one of the richest silver mines in Arizona. Large works, it is stated, will be erected on the property at once.

GILA COUNTY.

(Special Correspondence). — The Old Dominion Copper M. & S. Co.'s operations are now under the superintendence of F. W. Hoar. The smelting plant has three furnaces, one of which is in operation at present. Copper bullion and copper matte is produced. The latter is being held for shipment or resmelting. A tram line carries the ore from the mine to the bins above the bedding floor. Similar bins hold coke, lime and iron ore. The mine is on an ore body that trends east and west, lying along a contact of lime and diorite, the ores being found mostly within the lime. The property is worked through a 900-foot vertical shaft, the worked out ground being timbered with stulls and square sets. At the twelfth level is a pump. The water is discharged into a reservoir below the shaft, and thence is piped to the smelter. The ores from the Old Dominion include oxides, carbonates, silicates and sulphides of copper, though thus far the bulk of production has been carbonates, the sulphides having been struck at water level. Over the shaft is a 60-foot gallows-frame. The five boilers at the hoist and the four at the smelter use crude oil as fuel, storage tanks having been provided with which to carry a supply. One of these will hold 75,000 gallons. The lime and necessary iron oxide ores to mix with the copper ores are mined on the same property. The sulphide ores are not being smelted in large amount, but are being stored. The property is well equipped with machine shop, timber framing machine and storeroom.

F. D. Adams, manager of the Bobtail Mines Co. of Minneapolis, is developing a copper property on the southwestern slope of the Pinal range, 15 miles southwest from Globe. The group is made up of twenty claims and is opened by a 200-foot shaft, with levels run in on the 50, 100 and 200-foot stations. It is stated that there are 1500 tons of ore on the dump and 10,000 tons blocked out in the mine. The ore body is 2 to 5 feet wide. Plans have been made to erect a small concentrating mill, the ores being a sulphide, carrying gold, silver and copper values. A considerable tonnage of their sulphide ores will be hauled to the Black Warrior for use at acid plant. Mr. Adams is developing for the same company a gold property 1½ miles south of Ray, in Pinal county, where he has driven a 150-foot tunnel, a 50-foot winze and a 40-foot drift from the latter. It is claimed the ore here runs from $19 to $700 per ton. The work exposes a considerable tonnage that may be stoped. A 2-stamp mill, capable of handling ten tons a day, is en route to the property.

Globe, Jan. 11.

GRAHAM COUNTY.

C. B. Booth of Los Angeles, Cal., who recently bought an interest in some mines owned by W. J. Parks and others in the Stanley Butte mining district, near Clifton, states that within the next few weeks he will begin development work there on a large scale.

MARICOPA COUNTY.

The Lorna Doone group of copper claims, near Wickenburg, bonded from Mohnike Bros. by E. G. DeWitt and J. T. May of Colorado Springs, Colo., has had development work started. Sinking will be continued on the 60-foot shaft and at 100-feet drifts, and crosscuts will be made. E. G. DeWitt is Supt.

MOHAVE COUNTY.

The discovery of a big gold deposit by M. F. Wilkinson is reported in the Boundary Cone or Gold Roads district, 30 miles southwest of Kingman. The discoverer and his partner will put a force to work sinking a shaft at once. The ledge is said to be the Treadwell vein, recently sold to Los Angeles, Cal., people.

O. D. M. Gaddis of the Mocking Bird mine, situated in Weaver district, says a new shoot of ore has been uncovered while doing the assessment work. The vein has been considered a blanket ledge, but the ledge has in the last workings straightened up and is now dipping at 45°. The ore body is over 3 feet wide and shows free gold throughout. He states that $20,000 has been taken out from workings on the blanket ledge, and since the ledge has straightened up the values have increased. The property is owned by the Gaddis & Perry Co. and consists of eight claims, equipped with a mill and cyanide plant.

In sinking a winze from the 400 level in the Lucky Boy mine, near Kingman, an 18-inch ore body, said to be almost solid ruby silver, has been opened up. The ore is said to assay several thousand ounces silver and over five ounces gold to the ton. A hoist is to be placed on the mine at once and the winze opened through to the surface and sunk 200 feet deeper. T. B. Scott is the owner.

PIMA COUNTY.

H. Melluish of Tucson is sinking 100 feet on his nickel mine near Tucson. This mine has produced some high-grade ore.

SANTA CRUZ COUNTY.

The new sampling works of the Arizona G. & C. Co. at Patagonia, with a daily capacity of fifty tons of ore, are completed and ready for operation. Manager G. W. Crowe states that the company will begin buying ore.

YAVAPAI COUNTY.

In the Centennial M. Co. No. 2, at Big Bug, a 3-foot ledge of gold ore that assays $32 per ton is reported to have been struck. On the adjoining claims belonging to the same company ores that assay $5 and $6 per ton have also been opened up.

Ewing & Helmrod, who have bought the Ruby group of gold claims, on the Big Sandy, from W. H. Chapman, are preparing to start work on the mines. Ewing & Heimrod contemplate the erection of a complete milling plant, with concentrators and cyanide works.

An electric power plant is projected on Fossil creek, in the northeastern portion of this county, about 50 miles from Prescott. Surveys show water at Fossil creek from which 4000 H. P. can be developed. Mrs. I. E. Tutt of Los Angeles, Cal., is the promoter of the enterprise.

The Union mine, in the Bradshaw mountains, is being worked at present with a force of about fifteen men by a Detroit, Mich., company. The property is opened through a tunnel on the vein, and the company has started to sink a shaft to a considerable depth. W. J. Rainey is the president of the company and H. P. Nagle of Detroit, Mich., is secretary and treasurer. C. J. Kimball is Supt. and D. Kile mine foreman.

M. R. Kiley of the Oro M. Co., operating near Kirkland, states that he expects to have the company's new 150-ton quartz mill in operation by Feb. 15. He has sixty men at work. The mine workings are down 350 feet on a body of gold-bearing ore 6 feet wide.

W. S. Comer and A. Dake have received the first payment on the Gold Queen Nos. 1 and 2 and Kittie mines, located on Lynx creek. Detroit, Mich., people are the buyers. The old Kittie mine was worked in the early days with an arrastra by Mr. Knapp and is said to have been noted for its production of nuggets and coarse gold.

CALIFORNIA.

AMADOR COUNTY.

The annual stockholders meeting of the Lincoln G. M. Dev. Co. of Sutter Creek elected E. C. Voorheis president, C. R. Downs vice-president and T. J. Clavering secretary. The shaft at the Lincoln mine is now 1760 feet deep on the incline, and it is the intention to continue to 2000 feet. In June, 1901, an oil-burning apparatus was installed at the mine in place of wood for fuel. A 1200-barrel redwood tank was erected 160 feet north of the hoisting works, and it is connected with the boilers by a 4-inch pipe.

The Amador-Phœnix ledge has been cut at the 100-foot station. It varies in width from 6 inches to 2 feet 6 inches and is gold-bearing.

The Bay State mine has started work again after a year's idleness. Mr. Brendt is Supt. The mine has been kept free from water during the shut down. It is the intention to crosscut from 800 to 1000 feet to the east.

BUTTE COUNTY.

O'Connor & Grant of San Francisco have bought the Atkins tract, comprising a large block of Oroville river frontage, and lands of the J. Morgan estate, about 100 acres in all, including the bed of Feather river. The same people hold bonds for the Ward & St. Sure tract and the N. B. Crane tract, comprising some 200 acres, also at Oroville. It is probable that work will soon be begun on a dredger for the river front lands. Surveys and preliminary work are now in progress.

The Lava Beds Dredging Co. has been incorporated, capital $500,000, to work dredging ground near Oroville. J. K. Moffit, L. L. Holton, J. W. Goodwin, L. L. Wagner and A. G. Wright are the directors.

CALAVERAS COUNTY.

At the Tilford ranch, near Milton in Salt Spring valley, a fire last summer destroyed the underbrush and chaparral that covered the hills, and exposed many quartz veins that had been hidden by the dense thickets. The owner of the land has been prospecting some of these veins, and getting rock that assays from $2 to $30 to the ton. There are five veins that vary from 4 feet to 100 feet in width. They are in amphibolite schist slates, and can be traced for 2000 yards by croppings and float.

F. O. Courtmarsh of Glencoe has sold the Blue Jay mine, near Jesus Maria, to the Fannie Marie M. Co. of Glencoe for $20,000. He is to be general manager of the property and has bought machinery with which to commence operations.

EL DORADO COUNTY.

A milling test of twenty-five tons of ore from the Bacchi - Collins mine, near Georgetown, made at the Esperanza mill, it is claimed, returned values of nearly $50 per ton. At the Parson mine the shaft is now down about 160 feet, and several drifts from it have been run. T. Schlein is working a pocket mine by open cuts, a 65-foot shaft and over 100 feet of drifts. Over $400 has been taken from a single pocket in this mine. H. S. Martin and A. Presby have bonded the Comstock quartz claim from T. B. Epps for one year and have started work on it.

Development work is being done at the Golconda mine, near Centerville. Six men are running a 320-foot tunnel to tap the ledge. The Golden Gate was recently bought by the Golden Gate M. Co., of Bridgeport, Conn. A. F. Anable is foreman.

KERN COUNTY.

(Special Correspondence).—The Golden mine, owned by J. B. Ferris of Caliente, is 8 miles east of that place. The ores are hauled to Caliente and reduced in a 2-stamp mill and cyanide plant. A tunnel 1100 feet long is to be run to open up the mine 600 feet down. The vein is claimed to be from 40 to 60 feet wide and ore from the richer streaks in it has milled $31 a ton. The Cowboy mine, near the Golden, is a gold and silver proposition, producing some shipping grade ores. Bakersfield people are preparing to develop this property on a considerable scale. J. B. F.

Caliente, Jan 12.

At the Butte mine, Randsburg, the two drifts have come together. They met on a dead level, showing that the engineering was good. The entire distance between the two shafts is 850 feet and the two came together in $100 ore. A winze being sunk and at the depth of 25 feet shows a body of ore from 2 to 5 feet thick, which assays $50 per ton.

It is reported that the Southern Pacific Railroad Co. has bought from the Thirty-Three and Imperial oil companies section 33, in the Kern River fields, for $4,000,000. On the section there are about thirty producing wells, with a gross daily output of 4000 barrels. The purchase includes all improvements in the form of pipe lines, pumping plants and tankage, estimated at $250,000. The value of the land has been roughly estimated at $4,000,000. The selling companies had a good bargain, however, with the Southern Pacific, which it is stated probably led to the railroad company making the purchase. At an early date the Southern Pacific had agreed to handle all the oil produced on the property, for which it was to pay $1 a barrel. The report is unconfirmed, but it may be the company prefers to buy the land at a high figure rather than buy the petroleum at $1 a barrel.

MARIPOSA COUNTY.

At the Garibaldi mine at Kinsley the black ore taken out is very rich and from forty to sixty ounces of amalgam are taken off the plates every shift, with the battery holding 80% of the value in the rock. About thirty tons of ore is crushed every twenty-four hours in the 5-stamp mill, the ore not being sorted.

Sodderberg & Chambers have erected a 4-stamp battery on their mine near Kinsley. This mill is run by water power from the North Fork. They are crushing $40 ore, the vein being 2 feet wide. The Marble Springs mill is still running and giving good returns from the foot wall vein.

NEVADA COUNTY.

The Yuba mine at Maybert is to be started up soon with H. W. Morris as Supt. It is said to be the intention of the owners to put on new machinery.

At the Bonnie Bee mine, near Emigrant Gap, the tunnel on the 12-foot ledge is being driven ahead with machine drills at the rate of about 4 feet per day. The ore at present coming from the mine is high grade. The Bonnie Bee Co. will erect a 10-stamp mill early next spring.

The mill at the Red Cross mine, at Omega, has been destroyed by fire. The building was a total loss, and one of two Huntington mills and the engine and boiler were destroyed. The loss is estimated to be about $18,000, with $6000 insurance.

The Sierra Queen M. Co. has been incorporated at Nevada City by D. L. Miller, W. H. Martin, E. J. Rector, E. T. R. Powell and S. W. Marsh, to operate the Stiles mine.

It is reported that the Mineral Slide quartz mine at French Corral will soon be started up. It is owned by A. R. Dahlberg of French Corral. It is stated that the owners will erect a new mill.

The Siberia Quartz M. Co. has been in-

corporated to mine at Columbia Hill; capital $25,000. The directors are T. Curnow, G. F. Hendricks, R. McMurray, G. A. Bigelow, all of Columbia Hill, and F. Searls of Nevada City.

At the Union Blue Gravel (De Noon) mine at North Bloomfield the long bedrock tunnel is being pushed ahead with all possible haste and it is hoped that inside of fifteen months the gravel channel will be encountered. Supt. Gassaway has three shifts at work and the tunnel is being worked from three points. From the mouth about 600 feet has been run, while from the shaft on the tunnel line and level, some 2000 feet farther along, about 400 feet has been run north, while work has been commenced to connect with the work started at the mouth of the tunnel. At present a soft streak of hedrock is being run through and this ground has to be timbered.

H. Schroeder, W. Torpie and O. B. Marwick have leased the Black Bear mine at Rough and Ready to a San Francisco company, which proposes to develop the ground. It is a low-grade ore proposition, with a large ledge which goes $5 to the ton on an average as far as tested. The mine is opened hy a shaft 75 feet deep and a tunnel now in about 250 feet. It is estimated that the tunnel will give 200 feet of "backs." On the mine is a water power stamp mill with two 1000-pound stamps, and a concentrator.

G. W. Starr, W. B. Bourn, C. E. Clinch and associates have bought a controlling stock interest in the Wisconsin and Illinois mines, near Grass Valley. The amount paid is believed to have been $15,000. The new owners propose to pump out the shaft and make a thorough examination of the property, preliminary to planning the exploitation of the mine. The Wisconsin was located in 1854. The last to work it extensively were Charles Leach, Jacob Neff and the Coleman Bros. The Illinois ledge has been but little worked. The new directors of the company are C. E. Clinch president, L. P. Larue secretary, G. W. Starr, J. M. Lakenan, C. B. Lakenan.

The Mistletoe M. Co. of Nevada City has elected W. E. Parsons, E. B. Power, T. Ingram, W. J. Rogers and D. E. Morgan directors. D. E. Morgan is president and W. J. Rogers secretary. The company will at once proceed to develop the Slide mine, situated near French Corral. The property is composed of the Slide quartz mine, 3000 feet; the Sunset quartz mine, 1500 feet, and about 440 acres of land through which many gold-bearing quartz ledges run. The ledges can all be worked by means of tunnels. In early days considerable work was done upon the Slide mine and a 10-stamp mill (water power) was erected and worked with profit, ore as high as $30 per ton being found. This mill is to be repaired.

PLUMAS COUNTY.

J. D. Whitney has bonded the New York mine, near Greenville, and is doing some development on a large vein of good looking quartz.

The quartz mill at Crescent is crushing quartz from the mine owned by T. F. Emmons of Greenville, which is being operated under lease by J. D. Whitney.

SAN DIEGO COUNTY.

C. W. Pauly, receiver of the Golden Cross mine at Hedges, now the Free Gold mines, has submitted to the court his eighth report of operations. His statement shows: Bullion produced from mill, run from October 4 to November 4, $9754.45; cyanide plant returns, November 11, $6359.84; November 21, $5346.16; total hullion and cyanide, $21,457.45; total receipts, $22,892.55. The expense for labor was $7895.60; freight, $895.14; merchandise and supplies, $11,133.31.

SHASTA COUNTY.

The Iron Mountain mine, near Keswick, has started up. The fire which recently caused a suspension of operations is said to be under absolute control. One hundred men have been placed in the lower tunnel, known as the Confidence tunnel. It is said that 400 men will soon be working in the other drifts.

SISKIYOU COUNTY.

Whip & Poole of Colorado have bonded the Empire Bar mine, on Klamath river, for $6500. The claim is owned by D. McCarthy, J. Garvey, R. S. Taylor and J. F. Lodge of Yreka.

A good cleanup has heen made at the Ball mine, near Sawyer's Bar, from about 1500 tons of ore worked during December that averaged over $10 a ton. The sulphurets saved, it is claimed, more than pay the running expenses of the mine.

F. LeMay of Yreka says he has found an extensive ledge of jade, a green gem stone, valuahle for jewelry and used considerahly hy the Chinese in the manufacture of ornamental rings and bracelets, taking a brilliant polish.

It is stated that work will be started again in the Blue Gravel mines at Yreka.

TRINITY COUNTY.

The water from East and West Weaver creeks has heen turned into the pipe of the Sweepstake mine, near Weaverville, and the water on the mine is available for work. The ditch, pipe line and siphons are practically completed. At the pipe camp the machinery has heen taken down and stored.

TUOLUMNE COUNTY.

The Wheal Perrin mine, near Soulsbyville, has heen bonded to H. J. Sisty at $15,000 and 15% of the gross output until the mine is paid for. The property is owned by Mrs. Richards of Soulsbyville and V. Wooters and W. Glasson of Sonora.

D. Lumsden, J. Screech and G. L. Adams have bonded at $10,000 the Blue Eagle quartz claim to W. Berry. The mine is located in the Jawbone district on the Tuolumne river.

Work has been resumed at the mines of the Green Jumper Co., near Confidence. A crosscut tunnel is being driven in to tap the Jumper vein. It is understood that a mill will probably be erected in the near future.

The Stockton Smelting Co., D. N. Stradley manager, proposes to increase the capacity of the works at Sonora by the installation of additional crushers and other machinery.

Very fine ore is coming from the Snowflake mine, near Soulsbyville. The shaft is 70 feet deep. The vein is 2 feet wide and assays show values ranging from $67 to $140 per ton.

H. S. Scott is driving a tunnel into the Rough and Ready gravel mine on Tahle mountain, near Chinese Camp. The face of the tunnel shows pay gravel. The tunnel is now in 950 feet.

Underground work has been commenced at the Hope mine, owned by S. Ralston, near Sonora, and the 10-stamp mill started up. The mine is on the pocket belt, but the ore is said to be of good milling character.

COLORADO.

ARAPAHOE COUNTY.

It is reported that mine owners of Utah, Idaho and Colorado are holding a meeting in Denver, beginning Jan. 15th, to form an organization whose principal purpose will be to construct either one immense smelter at a central point for all their properties or one smelter in each State, to he independent of the trust. In Utah the men identified with the new movement include D. Keith, Senator Kearns and E. F. Holmes of the Silver King mine at Park City, J. Farrell of the Quincy and J. E. Bamberger of the Daly-West, also at Park City, and W. S. McCornick of Salt Lake City. The conference, according to a later statement, has been postponed to a date not yet fixed on account of the inability of many of the prominent men interested in the proposed organization to be present. It is understood that a much more comprehensive organization than the one originally planned is being prepared, and that the action of the coming conference will be of far-reaching importance to the lead and silver interests of the country.

BOULDER COUNTY.

The Caryl properties at Wall Street have been sold to Mrs. K. L. Cook of Wall Street, who proposes to work them on a larger scale than heretofore.

At tbe Dolly Varden mine at Ward a streak of ore has been opened up which has developed into a large hody about 24 inches wide, half solid smeltlng ore. It runs from $100 to $125 a ton. M. A. Sears is general manager and J. M. Doud Supt.

CHAFFEE COUNTY.

The work of clearing away the debris of the burned Buena Vista smelter has heen commenced and the construction of a new one started. Tbe furnace will be increased to double the old capacity, and a second furnace installed. It is hoped to have the plant ready for operation early in the spring. The Buena Vista S. & M. Co., which owns the smelter, has been merged into the Gold M. & M. Co., which owns the Mary Murphy mine at Romley

CLEAR CREEK COUNTY.

The Perigo property, near Central City, is to he operated by the owners, Potter & Lighthourne, after having been successfully worked for several years by the Tonawanda L. & M. Co. It is understood that Mr. Lightbourne will be Supt., wlth D. C. Earl as underground foreman.

G. E. McClelland of Idaho Springs, managing director of the Monarch M. Co., and who is driving the McClelland tunnel from Dumont to the Lamartine mine, states that he commenced the tunnel on the first of last July and on the 10th of January had completed 1000 feet. He is working three shifts every day in the month.

The Argentine tunnel of the Waldorf Co. will pass under the crest of the Continental Divide, 1500 feet helow the surface. The tunnel, 8x8 feet in the clear, is belng driven hy hand at present, two shifts being employed, and is now 500 feet in length. Its entire length when completed will be 9000 feet and it will connect with the fourteenth level on the Stevens group on the western side of the range, which is now 2000 feet in length. To complete the tunnel 6500 feet more will have to be driven. The company is planning the installing of power drills at both ends of the tunnel in the early spring.

EL PASO COUNTY.

The Waldo S. & M. Co. has been incorporated with C. L. Tutt, S. Penrose, C. M. McNeill, K. R. Babbitt, H. C. Hall, J. O. B. Gunn, T. W. M. Draper and R. C. Thayer as directors. The capital is $3,000,000 and principal office is Colorado Springs. The company will operate copper mines near Waldo, Josephine county, Oregon.

GILPIN COUNTY.

P. Mixsell of Denver, who is interested in the Mixsell-Burroughs mine in Gilpin county, says shlpments of ore now being made by him are running $65 net per ton, principally in gold.

HUERFANO COUNTY.

The Sierra Blanca M. & Red. Co., at Blanco, have a tunnel in 1400 feet and are hauling ore to the railroad. A mill and tramway will be erected and in running order before next July. The capacity is to he fifty tons per day, but the expectation is to enlarge the machlnery at a later date.

LAKE COUNTY.

The report of Secretary T. S. Brigham shows that during 1901 the South Winnie Co. of Leadville shipped 114 tons of ore, from which the net returns were $966.80. The operators of the South Winnie lease shipped 1876 tons of a net value of $46,795.81, of which the company received $12,487.86 in royalties.

OURAY COUNTY.

The Camp Bird Extension M. Co. has made final payment and received deeds for thirty mining claims about Imogene basin, near Ouray. The company has recently installed an electric drill in their main tunnel. The tunnel heading is advanced at the rate of 4½ feet each shift. It has been in ore for over 300 feet without a break, the ore streak averaging 4 feet. It is the intention of the company to build a mill early this season.

SAGUACHE COUNTY.

A rich strike in the Independent mine, at Crestone, is reported. The vein is 7 feet wide and was uncovered at a depth of 250 feet. The ore is gray quartz with white iron, and assays give $50 gold to the ton.

SAN MIGUEL COUNTY.

The Japan Mine Co. has resumed work on its mines in Marshall basin. Two air drills are working in the long crosscut tunnel that will open the Japan vein 600 feet below the present workings. A new mill of 150 tons daily capacity has been ordered. Thirty-five men are employed driving the tunnel.

TELLER COUNTY.

It is reported that the Elkton Con. Co., at Cripple Creek, has bought the Standard tunnel for $50,000. It is bought by the Elkton to provide a drain for the water from the mine. It is said that the tunnel will he extended some 2300 feet and cut the Elkton shaft at ahout 725 feet, enablIng the saving of the pumping expenses of a great quantity of water.

The water in the Elkton shaft is compelling the company to install another large pump, probably at the 700-foot level. The addition is expected to nearly double the volume of water discharged and, it is anticipated, will free the 800-foot level, which has been submerged for nearly a year. The boiler capacity will be increased from 1000 H. P. by two boilers of 250 H. P. each, bringing the total power up to 1500.

The Pointer M. Co. has granted a two-year's lease on the property on Gold hill, at Cripple Creek, to R. P. Russell. According to the terms of the lease, 300 feet of sinking is required. The royalty is graded. On all ores shipped up to $15 a ton, 15%; up to $100, 25%; and over $1000, 35%.

IDAHO.

BLAINE COUNTY.

The Mayflower M. & M. Co., Ltd., has been incorporated, capital $600,000, with office at Boise. The directors are A. Wilson of Martin, W. D. Garlock, J. H. Laing and J. R. Good of Boise and B. Mason of Nampa. The company owns the May Bell, Park Mammoth and Park Mammoth Fraction lodes, in Lava Creek district, near Hailey.

LATAH COUNTY.

F. Jenkins of Moscow is arranging to work the property of the Horse Shoe Placer M. Co. on Salmon river, which has heen owned in Wardner for several years. It is proposed to put on a dredger costing about $60,000.

SHOSHONE COUNTY.

The Oro Grande M. Co., with headquarters at Orofino, has been incorporated, capital $1,000,000, to work deep placer ground north of Pierce City, on the Oro Grande, a tributary of the north fork of the Clearwater. The incorporators are H. L. Gray, C. C. Smith, F. P. Mesick, O. A. Anderson and A. E. Holmberg, all of Orofino.

The Grangeville Hydraulic M. Co., with office at Grangeville, has heen incorporated, capital $150,000, with B. C. Wiltse, W. R. Crosby, B. L. Crosby, J. C. Meingassner and C. G. Aldridge directors. The company operates in the Pierce City district.

The shipments of ore from the Cœur d'Alene mines for the year 1901 were 148,890 tons, as compared with 171,412 for the precedlng year, a reduction of 13%.

MONTANA.

DEER LODGE COUNTY.

On the copper claim owned by M. F. Jensen and J. Simonsen, near Anaconda, a lead over 100 feet wide has been struck showing pay ore.

FLATHEAD COUNTY.

From the Sullivan mlnes, owned by Sullivan Bros., on the Stillwater river, near Kalispel, a recent trial shipment of 1600 pounds netted a clear profit of $9. The packing from the mines to the nearest railroad point alone cost $2.50 per hundred pounds. The mine is a copper proposition.

GRANITE COUNTY.

F. D. Brown, manager Sunrise M. Co. in Flint River valley, between Philipsburg and Drummond, says his company is putting in a large cyanide plant to treat ore from its mines with much less cost than at present.

JEFFERSON COUNTY.

H. F. Poland, manager Boss Tweed gold mines at Pony, owned by A. C. Burrage and associates of Boston, Mass., says that in the equlpment of the Boss Tweed a tramway from the mine is being constructed, and at its terminus a big mill is being erected at the mouth of the main tunnel on the mine.

A. S. Ray, who has been in charge of sinking a shaft on the Boulder mine, near Basin, owned by the Boulder-Comstock M. Co., has made arrangements for the lnstallation of a hoist. He has sunk 200 feet with a whim. The Boulder vein is from 6 to 8 feet wide between walls and carries copper and gold.

LEWIS AND CLARKE COUNTY.

The Vautour mine on Red mountain, near Helena, is to be developed to depth. D. J. Tallant and J. Peterson, who have leased lt from Beattie Bros., have installed a steam hoist and propose to slnk to the 300-foot level.

SILVER BOW COUNTY.

It is reported that the Ophir claim at Butte will soon be ln operation again, the Ophir M. & D. Co. havlng been incorporated hy W. G. Young, F. Harris and A. B. Clark of Butte, J. T. Morrison of Racine, Wis., and M. Newberger of Chicago for that purpose. The capital is $200,000 and the principal office of the corporation is in Butte. The Ophir mine is one of the oldest in the district and has yielded considerable gold and silver. With the exception of a few months, however, it has not heen worked since the drop in silver in 1893.

Work was resumed on the 15th inst. in the Mountain View mine, of the Boston & Montana Co., which has been shut down since last October. It is stated that the other mines of the company are to be started at once. When they were shut down they were producing 2000 tons of ore a day. The smelter at Great Falls has also been started up again, and it is stated that orders have heen received by the Great Northern Railway to haul 1500 tons of ore daily from Butte to Great Falls.

NEVADA.

HUMBOLDT COUNTY.

The Sheba M. Co.'s officers, H. M. Wells, Judge Bartch, C. O. Whittemore, J. P. Boyle, M. H. Hennessy and C. H. Vale, have been at the mine at Humboldt to select a site upon which it is proposed to erect a concentration mill.

LINCOLN COUNTY.

S. A. Bedell and J. H. West of Needles, Cal., have sold the Leland group of eight claims, near Needles, for $50,000, to people represented by T. Ewing of Los Angeles, Cal. The new owners will continue work already hegun by them while operating under a hond.

At the De Lamar mine at De Lamar dry crushing bas been finally abandoned and replaced by wet crushing. The new plant is equipped wlth Chilean mills.

NYE COUNTY.

Reavis & Nelson have bonded the Little

Butte and Yellow Aster claims, near Tonopah, to J. Young at $30,000. Mr. Young agrees to sink 100 feet and should the ledge, which assays $20 in gold a ton, go down, the property will be taken over.

LYON COUNTY.

A new 100-ton cyanide plant is being built at the old Carson Valley mill site, 6 miles below Yerington, to work the large deposit of Douglass mill tailings. It is estimated that there are about 400,000 tons of these tailings and they are under bond to A. F. Rogers.

OREGON.

BAKER COUNTY.

The Gilkison group of copper claims in the Copper Butte district has been bonded at $50,000 for sixty days. This is a property first exploited in 1873, when a furnace was erected and several tons of copper smelted. Recently a new ledge was discovered which, it is said, shows an ore body 12 feet wide, with an assay value of 12% to 30% copper.

GRANT COUNTY.

A representative of the stockholders of the Badger M. Co., owners of the Badger and other quartz claims at Susanville, has been at the mines several weeks, making examinations looking toward the erection of a reduction plant in the spring.

JOSEPHINE COUNTY.

Smith Bros. have sold a half interest in the Baby mine, in the Jump-off-Joe district, near Grant's Pass, to F. F. Hannum and W. S. Town. The other owners of the mine are A. L. Meyers and H. G. Rice. A clean-up of thirty ounces has been made from eight days' run with a 2-stamp mill.

W. H. Dana, manager of the Copper Stain mine, on Mt. Reubon, near Grant's Pass, states development work is being continued, and it is the intention to put on a 10-stamp mill next spring. A wagon road to the mine will be one of the first improvements made.

The copper property on Little Pickett creek, near Grant's Pass, owned by H. E. Booth and R. E. Barrickman of Merlin, is being opened by a tunnel. The ledge is about 12 feet wide and carries values in gold as well as copper.

MALHEUR COUNTY.

The Malheur M. Co. of La Grande has elected M. E. Simpson president and R. M. Cann secretary. The company's mine near Malheur City is being developed, one shift of men working in tunnel and one in shaft. A mill will be installed in the spring.

NEW MEXICO.

COLFAX COUNTY.

A vein of free gold ore has been struck on the Legal Tender mine at Elizabethtown. The ore, it is claimed, runs $20 a ton from a 3½-foot vein.——On the Senate Bob-Tail mine a strike has been made of ore which runs high in gold and silver and is sufficiently large to be worked at a profit.——The 200-foot tunnel on the McGinty mine has struck the vein exposing a fine body of ore.

DONA ANA COUNTY.

The Central G. & C. Co. at Gold Camp in the Organ mountains has struck a body of ore in the Bullion mine 2½ feet thick that, it is reported, runs $125 to the ton and carries good values in copper and silver.

Attention is being attracted to the Picacho mountains, 6 miles west of Las Cruces, a low range cut and broken by deep ravines. The principal mineral is iron, of which huge ledges extend for miles south and north, carrying from 40% to 60% iron. H. Bauer of Las Cruces has struck gold ore that assays $8 a ton.

GRANT COUNTY.

The Empire C. Co. has been incorporated at Phœnix, Ariz., capital $100,000, by D. C. King, J. Askroft, G. P. Gates, J. A. Herrera of Phœnix, Ariz., and J. G. Hilzinger of El Paso, Texas, to operate at Santa Rita.

OTERO COUNTY.

B. F. Schermerhorn, Supt. of the Three Bears mine at Jarilla, has run a tunnel 30 feet upon a shoot of very high grade ore, and has sunk a shaft 140 feet and run 400 feet of drifts.

SANTA FE COUNTY.

The San Miguel mine, near Golden, is to have an arrastra installed to treat the ore. The San Lazarus Co. has a large force employed with Mr. Conger as Supt. The company expects soon to have ore to keep its mill running steadily.

SOCORRO COUNTY.

E. Craig, owner of the Last Chance mine, near Mogollon, has installed the cyanide process and states it has proved successful. The process recovers, he claims, 90% of the values in the Last Chance ore and costs but $2 per ton.

TAOS COUNTY.

The drill on the Anaconda mine, near Red River, is down about 410 feet and is to be put down to 500 feet. At that depth if the vein, which at the surface dips at an angle of 45°, is not cut, a second drill hole will be put down close to the old shaft. If the vein is encountered it is said reduction works will be erected.

W. Vandever & Co. will resume work on the Mark Twain mine near Lobo.

I. T. Burns and Elizabeth Burns of Taos have sold to E. Hatton the Gold King and Gold Queen mining claims at Red River.

TEXAS.

Chamberlain & Malley on the 10th inst. broke the world's record in the miners' drilling contest at El Paso. Four double-handed teams entered the contest. The record made by Chamberlain & Malley of Arizona was 40⅛ inches in fifteen minutes, which beats their own record by a quarter of an inch.

Oil has been struck near Columbia in an entirely new field, situated about 150 miles west of the Beaumont oil district. The well is reported to be a genuine gusher and flowing at least 30,000 barrels of oil per day. The oil has not yet been tested, but it has the appearance of being of the same character as the Beaumont oil.

UTAH.

SALT LAKE COUNTY.

The properties of the Old Evergreen M. Co., between Park City and Alta, are to be systematically developed. In the original working copper ores carrying gold and silver were mined, but no depth was ever attained. H. G. McMillan of Salt Lake City is secretary of the company.

The main tunnel which is to be the main outlet for the Dalton & Lark, Brookline, Antelope and other of the Bingham Con.'s group of Bingham mines, draining the entire territory embraced within them, is now in 2200 feet and is advancing toward the 8500-foot station, the intended end, at a rate of progress that V. B. Sherrod, the company's engineer, says almost insures its completion in a year. A record of 87 feet in a single week has been made. The first connection will be at 4336 feet, where the Miner's Dream vein will be tapped, while the shaft which is now going down will reach the tunnel level at the 4500-foot station, and enable drifting both ways from headings from it.

SUMMIT COUNTY.

The zinc plant at Park City has begun 1902, Manager Mayne states, with an output of twenty tons daily of concentrates that yield from 55% to 60% zinc per ton, and with a by-product which carries as much as 45% iron, twenty ounces silver and 7% lead per ton, each of these products paying a margin of profit.

TOOELE COUNTY.

The Silver Copper King M. Co. has been incorporated, capital $30,000, with W. S. Naylor president and J. J. Whitaker secretary. The company owns the Silver King, Silver King Nos. 1, 2 and 3, Grace, Excelsior, Thad, Mother, Mother South and Monster claims, in the Erickson district.

WASHINGTON.

JEFFERSON COUNTY.

A rich strike of gold-bearing quartz is reported on Donwallips river, 20 miles from Port Townsend. Croppings, it is claimed, assay $150 to $200.

FOREIGN.

BRITISH COLUMBIA.

J. H. McKenzie, manager of the L. Roi mine at Rossland, states that the decline in copper has made a difference to that mine of about $1.14 a ton in the price received for the ore. It is claimed, however, that the recent improvements in the Le Roi plant have brought about a reduction of 50 cents a ton in the cost of mining, while betterments in the process of calcining at the Northport smelter have reduced the cost of smelting 75 cents per ton, making a total reduction in cost charges of $1.25 a ton, while the loss through the drop in copper has been only $1.14 a ton.

The Lardeau district in 1901 produced 37273 tons, valued at $375,016. The Boundary district in 1901 produced 371,873 tons against 99,730 tons during 1900—a gain of 272,143 tons. The Rossland district in 1901 produced 293,200 tons against 221,902 for 1900—a gain of 71,298 tons. The total export in 1901 of the Slocan district, including both the dry and the wet ore belts, is estimated at 35,000 tons.

Development work on the Lardeau Valley Mines, Limited, at Lardeau, is progressing favorably, according to J. Rutherford, engineer in charge. The ore assays about $58 per ton, carrying gold, silver, copper and lead values.

The Silver King mine at Nelson, during the three months ending Sept. 30th, made a net profit of over $60,000 on its own ore and a further profit of $20,000 was made on smelting custom ore. During the following four weeks the output of the mine was 3086 tons, averaging 27.78 ounces of silver and 6½% copper. The ore reserves are estimated at 20,000 tons.

During 1901 the total production of ore from Ymir district was nearly 90,000 tons. The larger portion was by the Ymir mine, which has averaged about 5500 tons per month. The other producers are the Yellowstone, the Arlington, the Fern, the Wilcox, the Tamarac and the Second Relief. At the Ymir mine between 60,000 and 70,000 tons of ore were treated by the 80-stamp mill, the profits from which have been sufficient to return $192,000 dividends, amounting to 20% of the capital.

The gross value of the ore shipped from Rossland mines during 1901 is estimated at $3,700,000. The camp's output, as secured from the mines, is as follows:

Mine.	Tons.
Le Roi	150,876
Centre Star	53,600
Le Roi No. 2	39,160
War Eagle	19,900
Rossland G. W	10,681
Iron Mask	3,733
Homestake	20
I. X. L	230
Spitzee	200
Velvet	563
Monte Cristo	20
Evening Star	74
Giant	74
Portland	24
Total	279,133

The properties of the Morrison Mines, Ltd., in Deadwood camp, Greenwood, have been bonded to New York and Chicago people at $185,000. President J. Hunner and Manager F. H. Oliver state that the bond is taken in the name of A. C. Whitney, trustee, of Chicago, with a cash payment of $5000 being made, the second payment of $80,000 is to be made within sixty days, and the final payment of $100,000 on July 1 next.

KLONDIKE.

The Dago Hill quartz find is reported now sufficiently developed to warrant the assertion that it is a commercial proposition. The ore goes $78.44 to the ton, and the ledge at present is 30 feet in width. The company operating it has taken out some ore and a great deal of work is mapped out for the property. The owners of the stamp mill have announced that for the present they will handle all ore from the new prospects now being opened up free of charge as a means of encouraging quartz prospecting. The mill is a small one, having but five stamps, but it will be increased in size and capacity as conditions and the demand warrant.

Personal.

W. S. KEYES has returned to San Francisco from Calaveras county, Cal.

E. H. BICKFORD is manager Lake Valley Mine Co., Lake Valley, N. M.

J. J. CRAWFORD has returned from El Dorado county, Cal., to San Francisco.

W. J. SHARWOOD of Marysville, Mont., is visiting Soulsbyville, Tuolumne county, Cal.

W. WESTON of Denver, Colo., was at Kingman, Ariz., during the first part of this week.

J. B. BACHICH has been appointed Supt. of the Golden West mine, near Sonora, Cal.

J. O. ROUNTREE has returned to Portland, Or., from a short sojourn at Ketchikan, Alaska.

PERCY WILLIAMS has resigned the superintendency of the Century M. Co., at Park Valley, Utah.

F. O. CORTMARSH has returned from Boston, Mass., and is now Supt. Blue Jay mine, near Jesus Maria, Cal.

F. B. HENDERSON has been appointed manager Associated Oil Companies, with headquarters in Bakersfield, Cal.

J. H. JENKINS, late manager Tonopah M. Co., Nevada, was in Salt Lake City, Utah, on the 11th inst., en route East.

G. A. WAGNER is manager Cerbat M. & Red. Co., operating the Alexander mine, at Union Basin, Mohave county, Ariz.

B. L. SMITH of Eureka, Nev., has been appointed Supt. of the Richmond M. Co. of that place, succeeding R. K. Morrison, deceased.

FRED ZEITLER has resigned as Supt. Champion mine, Nevada City, Cal., and has made arrangements to locate in San Francisco.

W. CLIMO, Supt. Shannon mine, at Clifton, Ariz., has returned to that place from several months' sojourn in England and Europe.

CHARLES L. LANG has resigned as Supt. Mack Con. M. Co., at Big Oak Flat, Cal., which position he has filled for the past three years.

J. W. MORGAN has been appointed Supt. St. George mine, at Stookton Hill, Mohave county, Ariz., succeeding T. McMahon, resigned.

MANAGER V. BARND of the Tybo M. & R. Co. of Ely, Nev., and A. Oldoerp, E. M., of Parral, Mexico, were in Tonopah, Nov., last week.

A. GRAVES, manager of the Alma M. Co. at Carbo, Sonora, Mexico, is in Denver, Colo., testing ores from the mines to determine a process for adoption.

T. A. YAGERMAN of London, who has been at Ouray, Colo., examining the Camp Bird mine for the Venture Co. of London, has returned to London and will go from there to the Transvaal.

SAM T. PARKS of Jackson, Cal., left San Francisco on the 9th inst. for Panama, Colombia, where he goes on the staff of the Darian G. M. Co., of which W. E. Proctor of California is Supt.

A. B. HALL has resigned as Supt. Reward mine, Independence, Cal., and has accepted a similar position with George & Co. of Los Angeles, Cal., taking charge of their mine at Hot Spring Junction, Ariz.

JESSE J. MACDONALD, M. E., has resigned his position with the Gold & Silver Extraction Co. of America, Ltd., but will continue to identify himself with cyanide matters in California and Arizona, being personally established at 128 N. Main St,, Los Angeles, Cal.

Commercial Paragraphs.

A. LESCHEN & SONS' ROPE Co., of St. Louis, Mo., have moved their Chicago offices to 137 Lake St., where they will carry a full stock.

THE Feather River Exploration Co., Oroville, Cal., has contracted for two new dredgers, to be built by the Risdon Iron Works, San Francisco, Cal.

THE Spring Valley Water Co., of San Francisco, Cal., will put in three new engines, each with daily capacity of 4,000,000 gallons. They will cost $70,000.

THROUGH its English agents, Geo. Angus & Co., the New Process Raw Hide Co., Syracuse, N. Y., in one month received orders for its new process noiseless pinions from eleven leading British electric companies.

ADAM SCHILLING & SONS, manufacturers Golden Gate gas engines, 211-213 Main St., San Francisco, Cal., shipped this week a 16 H. P. hoist to the Ricawillibe Mines, Ltd., Slocan City, B. C. The construction of the machinery is such that the hoist can be thrown out of gear and the engine used for other purposes.

THE Con. Cal. & Va. M. Co. has awarded a contract to the Allis-Chalmers Co. of Chicago, through their agent, George E. Ames, No. 137 Montgomery street, San Francisco, for three duplex double acting electric driven Riedler pumps, each having a capacity sufficient to raise 1500 gallons per minute from the 2150-foot level to the Sutro tunnel, an elevation of about 450 feet. Each of these units will be driven by a 225 H. P. Westinghouse induction motor, operating at a speed of 495 revolutions per minute. It is intended that these pumps shall run at 110 revolutions per minute, and the motor speed reduced to that of the pumps by means of cut cast iron gearing. The combined capacity of these three units will be 4500 gallons per minute, and they will be arranged that they may be operated singly or in combination. The electrical energy will be transmitted from the surface to these pumps on the 2150 station at a potential of 2300 volts by means of a three-conductor, iron-armored, lead-covered cable. This is the second step toward the final unwatering of the Comstock, and it is believed that these pumps working in combination with the hydraulic elevator now in use will enable the Con. Va. people to reach the bottom of the C. & C. shaft within the present year. The general arrangement for the pumping plant was perfected by Supt. Joseph R. Ryan and Leon M. Hall, consulting engineer for the mining companies, and the pumps will be of the well-known Riedler type, with mechanically operated valves.

"TWELVE inches, one foot; three feet, one yard." Generations of school children have repeated the formula in monotonous sing-song, little dreaming that a yard might not be the same everywhere. When some of the boys grew up and became surveyors or constructing engineers, they found that feet and yards were variable quantities; that diversity of standards and mechanical inaccuracies in tapes were stumbling blocks in the way of perfect work. The uncertainties of the situation were curiously illustrated in Philadelphia a while ago, when each side of a piece of land had been measured by a different standard. In overcoming the first difficulty, the United States Government has taken the initiative by establishing the National Bureau of Standards, which

is soon to have a fine building of its own on the line of Connecticut avenue, in a suburb of Washington. Private enterprise has come as near as human effort can to disposing of the second difficulty. Over and over again have the steel tapes made by the Lufkin Rule Co., of Saginaw, Mich., been tested by Uncle Sam's experts. Discrepancies between these tapes and the standard have indeed been found, but they were expressed in decimal fractions so small as to be meaningless to the layman and of no practical importance to engineers, accustomed as they are to mathematical hair-splitting. To understand the work of the Lufkin Rule Co. it is scarcely needful to remind readers of this journal that a steel tape is as sensitive as an exposed nerve in a tooth. It is affected hy changes of temperature that even a sick bahy would not feel. A cold finger or a warm breath makes a difference in it. Yet the Lufkin tapes are made of steei so excellent and uniform in temper and are graduated with such nicety that the makers feel warranted in giving a guarantee of accuracy. That this confidence is shared by engineers and by teachers of engineering has been abundantly proved. When you stop to think of it, the dependence of mechanical art upon a thin rihbon of graduated steel appeals strongly to even a dull imagination. The Lufkin tape is more than a mere article of commerce. It is a valuahle contrihution to the branches of industry which do most for the material and intellectual progress of society.

Books Received.

"Mineral Resources of the United States for the Calendar Year 1900," by the U. S. Geological Survey, Charles D. Walcott director and David T. Day, Chief of Division of Mining and Mineral Resources, 8vo, 927 pages, is the gathering together, completion and publication in one volume of the data heretofore published hy the Geological Survey in bulletins. The volume is quite complete in its statistical information and is valuable for reference. It is published hy the Government Printing Office at Washington, D. C.

"Power and Power Transmission," by E. W. Kerr, M. E., assistant professor of mechanical engineering, Agricultural and Mechanical College of Texas, 8vo, 356 pages, 246 figures, is a text-hook for students of mechanics, made up largely from the suhject matter of lectures delivered hy the author to students of the elementary principles of engineering, and is, as the author says, rather a collection of such principles and information as would direct the beginner along the proper course of study than an attempt to add new material to the science. Published by John Wiley & Sons, New York. Price, cloth, $2.

Latest Market Reports.

SAN FRANCISCO, Jan. 16, 1902.

SILVER.—Per oz., Troy: London, 25 $\frac{15}{16}$d (standard ounce, 925 fine); New York, bar silver, 55½c (1000 fine); San Francisco, 55½c; Mexican dollars, 45½c San Francisco, 44½c New York.

COPPER.—New York: Lake, 1 to 3 casks, $11.50; carload lots, $11.25; Electrolytic, 1 to 3 casks, $11.12½; carload lots, $11.00; Casting, 1 to 3 casks, $11.00; carload lots, $10.75. San Francisco: $14.15. Mill copper plates, $17.15; bars, 24@18c. London: £45 10s per ton.

LEAD.—New York, $4.00; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £10 7s 6d per ton = 2.16 cents per lb.

SPELTER. — New York, $4.35; St. Louis, $3.95; London, £16 10s per ton; San Francisco, ton lots, 5c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, $16.00; gray forge, $15.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27.00; open hearth billets, $29.50; San Francisco, har, 7o to 12c per lb.

TIN. — New York, pig, $23.50; San Francisco, ton lots, 26c; 1000 lbs., 26½c; 500 lbs., 26¼c; 200 lbs., 26½c; less, 27c; bar tin, ℔ lb, 30c.

PLATINUM.—San Francisco, crude, $19 ℔ oz.; New York, $20.50 per Troy oz

BISMUTH.—New York, ℔ lb., Subnitrate, $1.50; San Francisco, $2.50 to $2.75 lt lots.

QUICKSILVER. — New York, $51.00 large lots; London, £8 17s 6d; San Francisco, local, $48.00 ℔ flask of 76½ lbs.; Export, $45.00

MAGNESIUM.—New York, $2.90 ℔ lb.; San Francisco, $3.75.

ZINC.—San Francisco, 5½c; slab, 5¾c; bar, 7c; zinc dust, N. Y., 6c.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 17c; San Francisco, Plumbers', 100-lb. lots, 14.25c.

NICKEL.—New York, 50@60c ℔ lb.

PHOSPHORUS.—F. o. b. New York 50@60c ℔ lb.

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $53.50, large lots.

TUNGSTEN.—New York, ℔ lb., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 32c; San Francisco, 65c (60%).

ASSAY LITHARGE.—San Francisco, 10c ℔ lb, small lots.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12o. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 30@31c ℔ lb.; carloads, 28@29c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2½@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; horax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bhls., $1.25@1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $7.00; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.50. Coke, $16 per ton in hulk; $18 in sacks.

OILS.—Linseed, pure, boiled, bbl., 72c; cs., 77c; raw, hhl., 70c; cs., 75c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 90c; cs., 95c; No. 1 bbl., 65c; cs., 70c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

Notices of Recent Patents.

Among the patents recently ohtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WEIGHING AND RECORDING APPARATUS.—No. 690,855. Jan. 7, 1902. Wm. Green and S. Cbisholm, San Franc'sco, Cal. Tbis apparatus is designed for weighing purposes. It conciets of a weight, a motor, means intermediate by which tbe weight is caused to move along tbe scale heam until it arrives at a point wbere the weigbt is counterbalanced and the heam sinks, and electrical contacts through which the current passes to drive the motor, oce of which contacts is hroken hy the sinking of the heam so that the balance weight stops at a point indicating tbe amount.

AUTOMATIC CAN HEADING MACHINE.—No. 690,593. Jan. 2, 1902. A. W. Livingston, Alameda, Cal. The object of this invention ie to rapidly and accurately apply the heads to cans, and it consists of conveyore hy which the heads and bodies are separately introduced into the machine, the heads placed upon the bodies and means for seaming the heade and bodies, which means include a revolving table having revoluble guides or epiders around the periphery upon whicb the can hodies are held and the can bodies are received and centered upon tbe bodies the whole

MINING AND SCIENTIFIC PRESS.

Whole No. 2166.—VOLUME LXXXIV. Number 4. SAN FRANCISCO, SATURDAY, JANUARY 25, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Community of Interest in Gold Mining.

The principle of community of interest which is the hasis of the notahle change in the commercial organization of industry in the United States has received little attention so far from gold mine operators. At first casual consideration it might appear as though there was no place for it in their husiness. A closer examination will show a place for its application even in this most independent of all industries.

The community of interest principle is, in its hroadest, most comprehensive sense, the ultimate development of devices for avoiding or saving wastes and insuring increase. That many of its applications have created mischievous and unnecessary monopolies is the incident of the evolution of an idea into a system. The structural weakness shown is the weakness of the human element, which is for a time persistent in its ultimately futile efforts to heat the machine, and is not an inherent weakness in the principle itself.

In gold mining this element of weakness can he cut out. All gold miners are direct creators of wealth, or of money, its universal representative. The community of interest idea is not affected hy the personal equation arising out of the law of supply and demand. All possihle gold mines can be conceived of as heing profitahle to their individual operators independent of the number of the mines, the numher of individual operators and the different degree of profit they gain. Comhination of the ownership of the mines is not at all a condition precedent to community of interest in operation of the mines.

All gold miners are directly interested in the avoiding and saving of wastes, since these mean the direct and certain increase of the profit margin. They have a community of interest here which is real. If, hy the application of the idea an operative plan can he provided which will avoid and save wastes, gold miners should use it.

Without considering the principle ahstractly at all, the practice of gold miners has already provided many concrete examples of its more or less partial application. It would seem as if the time has come in which hy the frank, direct recognition of the principle, and hy its study in the ahstract, substantial advances could he made on the partial practice already estahlished.

Gold miners have lost much in the direction indicated hy a secretiveness as to details of operations which it is a mistake to assume publicity would injuriously affect. Community of interest must start with a community of knowledge. There is no other hasis for it. It is as true of gold mines as it is of manufacturing industries and commercial husinesses. Gold miners must divest themselves of the idea that a community of knowledge of the gold mines is necessarily a community of interest in their ownership. Community of interest applied to the operation of the mines would tend to diminish what now appear to he impossihle difficulties. Ignorance is not a factor of safety in any husiness. Knowledge is. Let then the community of interest of gold miners hegin hy estahlishing itself on the firm foundation of community of knowledge of the gold mines. It is not to he denied that some small gains are made hy secretiveness. They should not obscure the fact that giving such small gains up opens the way for very much larger gains.

It is not to he inferred from the preceding that the community of interest should embrace all the gold mining industry in one organization controlled from one central point. It would be a disadvantage to carry the application of the idea to that extreme. The husiness of gold mining cannot he conducted at long range. It has to he done at the mines. Each gold mining district, or even each locality or camp, can he made most effectively the center for the application of the community of interest idea hy the gold mine operators who are directly interested in the mines of the district or camp. The study of the mines and mining of each district will determine the natural limits of the community of interest for that district. It may prove to he one or several of the operations which are common to all of the mines. In some districts it will he pumping, in others milling, in others again the providing of a water, fuel or power supply. An economy and saving can be made and waste avoided by a community of interest on the part of the mine operators in such operations.

Small Current Motor Dredger.

A Small Dredger.

The accompanying illustration is of a small gold dredger operated hy a current motor. The entire rig is light and novel in construction. In its special field for working very shallow stream gravels, where there is sufficient current to the stream to supply the power, it is claimed to do satisfactory work.

The dredger consists of two flat bottom scow hoats connected by a hinged platform, with the current wheel set hetween them. The wheel is connected up to the dredger mechanism proper which is set on two other flat bottomed scows with the bucket ladder set in between them. The two sets of hoats are connected by a hinged frame, the whole making a sort of catamaran structure.

The dredger buckets bring up hoth the gravel and the sluicehead of water with which it is washed, discharging hoth into a sluicehox. The wash, after going through the sluice, passes to an amalgamating table. The capacity of the dredger is claimed by the inventor, O. A. Petterson, who is operating one in the Colorado river, near El Dorado canyon, Nev., to he ahout 10 cuhic yards of gravel per hour in loose river bar gravel. One man operates the dredger.

Crusher and Mill, Free Gold Mining Co., Hedges, San Diego County, Cal.—(See Page 50.)

TABLE OF CONTENTS.

ILLUSTRATIONS.—Small Current Motor Dredger; Crusher and Mill, Free Gold Mining Co., Hedges, San Diego County, Cal., 43. Meadow Lake Mining District, Nevada Co., Cal., 47. Electric Locomotive; Electric Locomotive Without Cover; Standard Storage Battery Electric Locomotive in Service, 50. Telephone Troubles and How to Find Them, 51. Camp of Consolidated G. M. Co. of Graham Co., Ariz.; Mining and Metallurgical Patents, 52.

EDITORIAL.—Community of Interest in Gold Mining; A Small Dredger, 43. Portland Cement in This Country; Cost of Producing Copper; A Secretary of Mines; Oregon Mines, 44.

MINING SUMMARY.—53-54-55.

LATEST MARKET REPORTS.—56.

MISCELLANEOUS.—Concentrates, 45. Meadow Lake Mining District, 46. Ankylostomiasis, 48. Gold Placers of Nome, Alaska; A New Method of Prospecting for Gold and Silver at a Great Depth; The Godbe Agitation Method of Leaching, 49. Mine and Mill Work at Hedges, Cal.; Electric Locomotives, 50. Telephone Troubles and How to Find Them; The Sparse Distribution of Tin, 51. A New Graham Co., Ariz., Mine; Mining and Metallurgical Patents, 52. Personal; New Patents; Notices of Recent Patents; Commercial Paragraphs; Recently Declared Mining Dividends, 55-56.

Oregon Mines.

Mining in Oregon has made a substantial permanent advance during the year 1901. The districts already well established, with Baker City, Sumpter and Granite as centers, increased their gold yield, and proved such an extent of new ground that a continuation of the increase of output can be looked for during the current year. Other districts just as well known, but from which less was expected, have made even greater relative advances. Josephine and Jackson counties, with Grant's Pass and Jacksonville as centers of development, have made notable advances toward the same permanent establishment of the gold mining industry that the first noted districts have already obtained. In these two counties, the first in which gold was discovered in Oregon, development has lagged by reason of the belief that gold values were entirely in shallow placers which were largely worked out. An increase of placer gold output during 1901 shows that this last supposition is not well founded. The notable feature of the late development is the extended working of the quartz ledges. Many new discoveries have been made, some of them appearing to be of very considerable magnitude. The little quartz mining of former years was largely a scratching of the surface for pockets. In 1901, however, many of these supposed pocket ledges were given deeper and more extended exploration and have through it become the beginning of permanent mines.

The area of possible gold mining was considerably extended during the year—not so much by entirely new discoveries as by the development of long known prospects which, unworked, were previously assumed to be valueless. The Blue River section in Lane county, lower Rogue river in Coos county, Malheur county, Union county and in the headwaters of the John Day river have all, from more or less discredited prospects, been proved to be at least possibilities. In some it is only a single mine so far, but that one is surely indicative of more yet undiscovered. All of these localities can be safely counted on as sure to make much more showing of potential value during 1902 than in the year just completed.

The discoveries and development of quicksilver deposits made in 1901 indicate a very considerable future for this branch of mining industry. The operations of earlier years with quicksilver mining in Oregon had not been encouraging and the older discoveries were unworked. The prospects of success with the newer ones is quite certain to cause a reinvestigation of the older ones, the failures of which were due to defective and costly methods of reduction, rather than to the failure of the mines to produce the anticipated quantities of the ore.

The presence of large deposits of copper ore in the extreme southwestern and the extreme northeastern corners of the State has long been known. Remoteness from existing transportation facilities had delayed development. In 1901, despite this adverse condition, considerable exploratory and preliminary work was done. The fall in the price of copper will very probably tend to defer development. The copper ores, however, carry considerable gold, which will be an incentive to their exploitation, even with the lowered price.

A possible mineral resource has been found during the year in asphaltum, and the discovery is being followed up by exploration for petroleum. Its discovery in Jackson county would assist materially in making the copper deposits available. In this connection there is much justification for investigation and experiment with novel processes for the reduction of the low-grade ores of copper, and the low-grade ores of nickel which exist in such great quantity at Riddles. There is no finality to the adverse conclusions from earlier attempts to beneficiate these ores which should lead to the abandonment of effort. It is within the last six months that the writer read in an Eastern mining paper a most elaborate mathematical and engineering demonstration of the commercial and technical impossibility of making iron from the ore direct by an electric current produced by water power. Within the last few weeks the statement is made that in northern Italy steel is being made direct from the iron ore by an electric current at a cost for the water power employed of $3.10 a ton. With such commercial results obtained under the most adverse conditions there should be no impossibility conceded with such valuable metals as copper and nickel to be recovered. There is no lack of cheap water power in Oregon.

A Secretary of Mines.

Congress is in session now. Of the two sessions of this Congress the present is the long session. There are always good reasons why little outside of the routine business of the Government is accomplished at the second or short session. The new matters that come up for constructive action by Congress have practically their only opening for consideration and action at this first and long session.

It is quite proper that right now should be put on Congress all the pressure that the interested mining industry has, to secure the creation of a Secretary of Mines and a Department of Mining. A bill has been introduced creating the office and the department. It should have the unanimous support of all members of Congress from mining States, and nearly all of the States are mining States now, and behind the Congressmen should be the individual support and insistence on action of the public who elected the Congressmen.

There is also a bill pending to create a Secretary of Commerce and a department for the office. From press reports this measure seems advancing toward final action. Its proponents, the commercial interests of the country, seem to keep their Congressmen at work on it aggressively. The business conditions of the country justify the establishment of the Department of Commerce, but to no greater extent than they justify the establishment of the Department of Mining. The forces that are moving for the one should be for the other. Both are desirable and should have common support in Congress. The Members of Congress whose constituents desire the Mining Department should not be backward about doing some real political missionary work on the Congressmen who have not yet sufficient light to see more than the Department of Commerce in prospective. Practically it should be easier to accomplish two desirable matters in Congress together, than to accomplish them separately.

The member of Congress from the Second California District in 1865—thirty-seven years ago—introduced a bill creating the Department of Mines. There is a suggestion of humor in the Congressman from the Second California District introducing a bill in 1902 to create the same department. The miners of the United States who elect Congressmen should not expect such long deliberation on an important matter. It is notable, however, that the principal objection urged against the creation of the Department of Mines is that the proposition is so novel that it requires a much longer consideration than it has had up to this time.

The farmers and commercial interests who want a Department of Commerce clearly do not intend to let grass grow on the graves of their Congressmen who first propose it, before getting what they want. The proposition may be novel, but they intend to consider and get it while it is novel and before it becomes ancient history written on tombstones.

Cost of Producing Copper.

The absence of a clear, intelligent statement of the cost per pound of producing copper, and how the cost is made, is still noticable in the press discussion of copper mining. The effect of the absence of such a statement is the making of a bad matter worse. It is a depressing force on copper mine values. The cost per pound of producing copper is practically dependent on the number of pounds of copper in the ton of ore that is mined and reduced. In very few mines is the copper so uniformly distributed in all of the rock matrix that a segregation of the ores in the mine into rich ores and poor ores is impracticable. In most mines a segregation can be made. A ton of ore yielding 100 pounds of copper costs no more to mine than a ton of ore yielding only fifty pounds of copper, and costs but little more to obtain the metal from it. The pound cost of copper with 100 pounds of copper in a ton of ore is then about one-half the pound cost of copper with only fifty pounds of copper to the ton. Some mines can adjust their operations to the change in price and continue to make a profit on production by simply changing the grade of ore mined. Whether or not it is good business policy to so operate a particular mine is a question that the mine owner must determine. The value of a copper mine is certainly diminished with a lower price for copper, even though its present profits be kept up by mining higher-grade ore. The leading question, however, requiring answer at the present time is what will the average sale price of copper be for, say the next two or three years. The most successful mining of copper during this period will be based on what proves to be the closest estimate of this price. Between the blocking out of the copper ore in the mine and the marketing of the copper to consumers the time interval is anywhere from six to eighteen months—the higher limit in large mines and toward the lower limit with small mines. A mistake in estimating the future price of the metal when blocking out the ore will affect the profit earning from it. Some custom smelters missed a correct estimate of the future price in buying ores, paying 75% of the current 17-cent price down and holding back 25% till the copper was marketed. Copper has dropped 35% uncovering the margin.

THE U. S. Geological Survey Report on the production of Portland cement in this country in 1900 notes that the quantity of imports of it remains about the same as for several years preceding despite the continued increase in domestic production and a large lowering in price. These imports are for the larger part into the Pacific Coast States, none of which are producers to any marked extent. Domestic Portland cement sold at an average of $1.09 a barrel with a constantly increasing production, indicates a good commercial profit in the business, which requires large capital investments in plant. The sale price of the imported Portland cement in the Pacific States at the ports of import varies with supply and demand but has seldom been below $2.75 a barrel. It seems as though it would be hardly necessary to point out the practically clear field for investment in Portland cement manufacture on the Pacific coast that would be sure to return a large profit. In proportion to population no section of the country is such a large consumer of Portland cement as the Pacific coast. With the lower prices that domestic manufacture would bring the consumption would be enormously increased. Portland cement is a manufactured product, the new raw materials for which are not monopolized by any section of the country. They exist in the Pacific Coast States over considerable areas and can be assembled very cheaply. There are certainly commercial possibilities in Portland cement manufacture here which should not be overlooked, particularly as the only competition that it will have to overcome is imported cement, which is handicapped by freight charges alone exceeding the cost of domestic manufacture.

Concentrates.

AT a temperature of 150° F. 5 cubic feet of water will weigh 305.8 pounds.

SULPHUROUS acid boils at 16° F.; hydrofluoric acid, 68°; ether, 95°; chlorform, 142°.

A COMPLETE practical treatise on gold milling appoarcd in tho issue of this paper of Dec. 1, 1900.

MULTIPLY the diameter of the wheel in inches by .2618: the product will be its circumferonce in feet.

MOST assuredly, "if gold can be separated into copper and load," these metals can be combined to make gold. But it can't.

TO TRANSMIT 100 H. P. with a belt ⅝ inch thick, running at 1800 feet per minute, the belt should be 17½ inches wide.

A ZINC ROD ⅝-inch in diameter, a carbon plate, and a saturated solution of sal-ammoniac in a glass cell constitute a simple electric cell.

STEEL reaches the greatest tenacity with about 1% of carbon; as the carbon departs either way from this quantity the tenacity diminishes.

MAGNETIC IRON ore bodies can be located, using the magnetic needle. A special form of instrument is employed, called the dipping needle.

CALCIUM CARBIDE is now made by fusing 100 parts of lime and 70 parts of coke in an electric furnace. A temperature of 27,000° C. is required for its formation.

A DYNAMO can be run in either direction by simply changing the position of the bushes so they will not catch the edges of the segments in the commutator.

HUBERNITE has a commercial value of about $200 per ton. It is used in tempering steel, and the market for it is in the manufacture of ordnance and armor plate.

AN engine having a cylinder 9x12 inches would raise one ton of ore in a car weighing 650 pounds a distance of 250 feet in one minute, the cage weighing 900 pounds.

CARBON can be melted or fused and vaporized, but it becomes carbon again when it cools. It is necessary to have enormous pressure in the case to produce diamonds.

WHERE tho weir opening of a flume is 72 inches wide, and the depth of water flowing over the weir is 5½ inches, there flows over 346.44 cubic feet, or 2591.4 gallons, per minute.

OF all materials yet examined fused silica is that which expands least by application of heat; rods or tubes of fused silica can be made red hot and plunged into cold water without being cracked.

THE weight by which diamonds and other precious stones are valued is the carat. One carat equals 205 milligrammes or $3\frac{1}{3}$ grains; one troy ounce equals 31,103 milligrammes, or 152.72 carats.

THE Betty-Carter electrolytic cyanide process is a zinc-lead couple formed by immersing zinc in a lead acetate solution, coupled with strengthening the solution in cyanide before entering the zinc boxes.

BOILER steam at 100 pounds gauge pressure has a temperature of 338° F. The evaporation of nine pounds of water from and at 212° per pound of coal burned, corresponds to a boiler efficiency of 70%.

THE market price of 80% ferro-manganese is $53.50 in large lots at Pittsburg. Ferro-manganese is made at the Carnegie works of the United Steel Co.; spiegeleisen by the Colorado Fuel & Iron Co., Pueblo, Colo.

SO FAR there is no determined limit to the distance that compressed air can be carried. Air has been utilized at a distance of 5 miles from the compressor. Friction in the pipe is the chief source of loss in transmission.

IN the impact turbine the ideal condition is when the peripheral velocity of the buckets is one-half that of the fluid comprising the jet. In the reaction turbine this velocity must be equal to that of the jet in order to give that ideal condition.

GASOLINE ENGINES, owing to the intense heat generated in the cylinder by the explosion, require a higher grade of cylinder oil than do steam engines. A 30 H. P. gasoline engine will use about 300 gallons of water per day. A steam engine of the same power would require 3000 gallons daily.

TELLURIDES may be cyanided or chlorinated, but must first be roasted. Rich tellurides are sometimes treated by means of sulphuric acid, which dissolves the tellurium, this substance being afterward reprecipitatod and collected, the gold subsequently obtained from the residues by smelting.

A WATER SUPPLY of 50 inches of water to run a 5-stamp mill, rock breaker, concentrator and feeder would have to be used under 100 feet head or pressure. This would necessitate a water wheel of the turbine or other type. An overshot wheel could not be used, as the diameter would have to be too great.

THE sag of a belt which should be allowed when it is first put on, and when it is being tightened later on, may be found by multiplying the decimal .0165 by the distance between the centers of the shaft in feet. The product will be the sag in inches under ordinary conditions. Where the distance is 20 feet the initial sag would be $20 \times .0165 = 3.3$ inches.

THE U. S. Circuit Court in an Alabama case has ruled that the miner assumes the risk of the tools furnished him by the mine operator and cannot recover damages for injury resulting from their use. The miner in this case was injured by the premature explosion of dynamite which he was tamping with an iron rod furnished for that purpose by the mine operator.

HYDRAULIC MINING is not "prohibited" in California. In the central portion of the State that branch of gold mining is under government restriction, but even in the area affected by such regulations there are nearly 250 mines working under permits obtained from the Government Debris Commission. On all streams not tributary to navigable waters the work goes on without restraint.

TO DETERMINE tho point in the stroke at which cut-off must take place in order to expand the steam to a given pressure, divide the terminal by the initial pressure; the quotient will the point of cut-off in decimal parts of the stroke. If the initial pressure is eighty pounds, and it is desired to securo a terminal pressure of twenty pounds, the cut-off must take place at $20 \div 80 = .25$ of the stroke. Both pressures are absolute.

LESS than 1% of the weight of petroleum remains as ash after combustion; the ratio of ash in coal is 5% to 10%. Petroleum can be burned under any kind of boiler, and its use may alternate with that of coal. To apply the petroleum it is only necessary to introduce a pipe carrying it and another pipe with compressed air or steam into the furnace, and arrange suitable nozzles to insure a mixture of the oil in a finely divided state with the air or steam.

A PATENT can be obtained for a placer claim with a hot mineral spring on it. The patent expressly reserves such springs from the grant where they are salt springs, but it is doubtful if the reservation has any force. The last ruling of the Land Department is that lands containing mineral springs not of a saline character are subject to sale under the agricultural land laws. Sulphur springs are not regarded as saline. A mineral spring can not be located or claimed as a placer.

SEVEN men, each owning a placer location of 20 acres, must do $100 assessment work on each location. If they have consolidated the locations so as to become owners in each they can perform $700 of work on one location if they so elect and it is assessment work for all of the seven locations. If the seven men take the seven claims of 20 acres each in one location of 140 acres, only $100 worth of assessment work is required. In every instance the location is the claim when assessment work is considered.

TO state "the requirements for an assay office supply" is not easy. So much depends. Assuming that the apparatus is provided, the assayer through the year would probably find use for crucibles, coke, coal, oil cloth, stationery, turpentine, belting, sieves, borax, litharge, niter, muffles, brooms, asbestos sheeting, gold pans, brushes, coal oil, moisture scale, nitric acid, alcohol, C. P. silver, funnels, filter paper, potash, samplers, cupel machine, bi-carb soda, sample sacks, red bricks, basins, shovels, bone ash, nails, pans and twenty other little items according to place and circumstance.

THREE of the principal ways usually adopted in mine surface sampling are, from the trucks to the mill; from the cam-floor shoots; from the feeders. Each of the three ways has its adherents. The chief objection to the first is the large quantity necessarily taken, to the second the tendency to have too much coarse rock in the sample, in the third the probability of there being too high a result. Quartering down, screen samples and pulp leaving the mill are also in favor among mill men. Automatic sampling in any and every case is considered superior in accurate results to hand sampling.

PROSPECTORS and traveling miners can use the automatic method of developing photographic plates, as it obviates all carrying of chemicals. Each plate is coated on the back with a prepared solution, and the development can be carried out in water slightly alkaline. The solution is composed as follows: Pyrogallic acid, 10 grammes; salicylic acid, 1 gramme; dextrine, 10 grammes; alcohol, 4 C. C.; water, 20 C. C. This solution is spread upon the back of the plate and allowed to dry. The exposure is made as usual, and, to develop, it is but necessary to put the plate in water, to which a few drops of ammonia have been added. The coating dissolves, and the developer is thus prepared.

WHETHER a dead animal body, lying on the bottom of a river, lake or pond will rise is a question of specific gravity and not of the sole efficacy of firing cannon to cause such body to come to the surface, though if the stomach of the body be intact, the body but little mutilated and the period of immersion sufficiently long to evolve gases of decomposition, its specific gravity is leslened to such a degree as to cause its detention on the bottom to be largely due to molecular attraction, and in that case any disturbance of the water, even by vibration occasioned by discharge of cannon, would have a tendency to disturb such adhesion, causing the body to rise to the surface.

THE grade of a ditch depends in some degree on the kind of ground through which it is made. Ordinarily, water should flow at the rate of from 180 to 200 feet per minute. The diameter of the pipe does not determine the pressure; this last is proportional to the head. A pipe line of 6-inch or 36-inch pipe with the same fall or head will each give the same pressure. Theoretically, the water forced through a nozzle should be able to attain the same height as the head; but in practice it will fall short. The friction of water in pipes increases as the square of the velocity, and is also largely determined by the condition of the pipes, whether old or new, clean or foul. With a sluice having a grade of 1 foot in 20, 40 miners' inches (60 cubic feet) per minute should wash 150 cubic yards every twenty-four hours.

REGARDING heating or warming of cyanide solution practical cyanide experts have found that warming the solution has very little beneficial effect, unless the solution falls below 45° or 40° F., in which case it loses its efficiency; as long as the solution is kept above this point the results obtained are regular; if too much heat is given to a cyanide solution and no "protective alkali" is present, hydrocyanic acid gas is evolved, which is really the life of the solution. Thus too much heat is to be avoided; by keeping the cyanide solution at about 72° F. the best results are obtained, but where the temperature of the buildings keeps the solution at from 50° to 70° F. no advantage can be otained by heating to 72°, for the expense of such heating overreaches the advantage in extraction, which is in itself very small. Calculating only 2% gain in extraction by raising the temperature from 50° to 72° F., the labor, fuel and apparatus involved in heating would leave no advantage in doing this.

GEOLOGICALLY, ore bodies are, ordinarily, secondary formations. With some exceptions, they have accumulated long after the country rock has been formed. While it has been widely recognized that close relationships exist between the formation of most ore bodies and the character of their matrix, the vastly broader generalizations regarding the intimate association of ores with geological structures have received less attention. The exploitation of ore bodies is often carried on in accordance with rules which the limited experience of the individual has pointed out. Where an operator untrained in scientific mining begins in an undeveloped mining district, his method of attacking the various problems presented is likely to be after that of his nearest observations elsewhere. He may hit upon the right plan of work at once, but the chances are that he will not. Only after repeated trials and failures, and after much fruitless expenditure of time and energy, does he finally reach satisfactory results. When, however, a specially trained geologist undertakes to make an investigation of a mining property, he, first of all, gets his bearings, as it were, with regard to the geological structure of the region and the distribution of the rock formation, and eliminates nine-tenths of the chances of failure in arriving at the best plan of operation. Instead of a great game of chance, the development becomes a strictly business proposition. These two methods of procedure indicate the essential differences between old and new ways of carrying on mining operations. The intelligent exploitation of ore deposits must have a broad geological basis.

NO PRESSURE per square inch indicates a horse power. The number of horse power, mechanical horse power, (M. H. P.), in water from a 6-inch pipe, with the inlet 100 feet higher than the outlet, is not practically determined from the water pressure at the outlet, but from the weight of water passed through the pipe in one minute multiplied by its fall in feet and divided by 33,000. The M. H. P. could be determined by multiplying the pressure per square inch by the number of square inches through which the water is discharging, multiplied by the velocity in feet per minute divided by 33,000. The first described method is employed because it is a simpler and more direct calculation. It is easier to weigh accurately the water than it is to measure accurately its velocity of discharge from the pipe. With gases—for example, steam—it is simpler and easier to measure the velocity and pressure than it is the weight; therefore, is used a different rule, though the fundamental rule on which both are based, the law of mechanical energy, is the same for both estimations. In determining the M. H. P. of a water power, first determine the volume of the water used, or proposed to be used, in cubic feet per minute, and multiply this by 62.4 to determine the number of pounds per minute. Next divide the number of cubic feet of flow per minute by 60, to determine the number of cubic feet per second, and divide this by the cross-section area of the pipe in square feet. The quotient is the velocity in feet per second of the water flow. In the November 23, 1901, number of this journal is a graphic table prepared from Weisbach's formula of the flow of water in pipes. The next step is to use this table. On the right hand side of the table take up the lines of diameter of the pipe and velocity of flow just found and follow them to their intersection. From this intersection follow the nearest horizontal line of the table across to the left hand, and the number found there will be the friction head of 100 feet of pipe, or the number of feet fall that the pipe must have to make the water overcome the resistance to the flow offered by the metal of the pipe for 100 feet length. Multiply this friction head per 100 feet of pipe by the number of hundreds of feet and decimals, and the product is the total friction head of the pipe. Add 1 foot to this total friction head, if the velocity is less than 6 feet per second, which it should be, and 3 feet if it is 12 feet per second. For higher velocities, refer the problem to an engineer or plan a bigger pipe. Subtract the sum just obtained from the difference in elevation between the inlet and discharge of the water or the total head. The difference so obtained is the real head of the water. Multiply the number of pounds of water first obtained by this head and divide by 33,000, and the quotient is the theoretical M. H. P. How much of this can be had as work depends on many mechanical details. It can be as high as 80% and may be as low as 40%. It is a good plan to assume 55% in preliminary estimates.

Meadow Lake Mining District.

Written for the MINING AND SCIENTIFIC PRESS by CHARLES W. RAYMOND, M. C. E.

After an interval of more than thirty years the mining district of Meadow Lake, Nevada county, Cal., seems to he coming to the front once more, and if the continuation of the work for the past eighteen months produces the results indicated this district will undoubtedly become a producer of gold and once more a noted mining camp of California. Meadow Lake district has long heen discredited. Many explanations have heen given and none have heen favorahle enough to suggest its reinvestigation. All on the contrary have tended to give it a most hlackened reputation. It has heen a "had example," a warning to would-he investors to keep away from the district and even out of gold mining. It has heen said to he a district of "ill defined veins," "of no depth," "with no values," a climate severe heyond imagination, "inaccessihle," and the ores of which, even did they contain values, unworkahle, because of their rebellious and refractory nature.

The U. S. Geological Survey has mildly recorded its adverse opinions. It is briefly referred to in the Truckee Folio, under date of January, 1898, and Colfax Folio of April, 1900, which read, "a few ill defined veins carrying auriferous sulphides only have been found." "Scattered veins * * * and * * * a vein system of some importance, though not very rich, is found in the vicinity of Meadow Lake and Old Man mountain."

And on looking over many mining reports deprecatory mention is made of this district in stock phrases, "veins in granite," "rebellious," "refractory," "honeyard of processes," "difficult of concentration," "a camp marked by unsuccessful attempts to profitably work its ores, which carry low values, and little gold, and located in a section offering poor transportation facilities, rigorous winters," etc.

That this reputation is undeserved; that the veins and vein systems are well defined and important; that the ores carry gold values and often are high grade; that these values can he extracted and without any complicated or expensive process; that the district presents no adverse climatic conditions at all, hut has an exceptionally delightful climate eight months of the year; that transportation facilities are very good and can easily he made hetter, and that, in fact, the Meadow Lake mining district does offer excellent inducements to investors as a profit-paying mining camp, will he the effort of the writer to show. The old repute of the district is really of that nature which can he described as the effect on the dog of giving it a had name. It would he easier to accept the consensus of adverse opinion which involved no responsihility or risks to reputation than to make a contrary one which involved responsihility, risk of reputation, and, it might he added, conscientious work on the ground.

Meadow Lake mines have had a long rest. They are awakening from a sleep of thirty years with new and hetter prospects. With the assistance of the experience in the handling and working of mines and ores gained in the interval, the old descriptions as "low grade," "rebellious and refractory," no longer truly describe the conditions. The present conditions make the district an example of what the MINING AND SCIENTIFIC PRESS so appropriately has described as the "Renaissance of the old mines."

While the history of Meadow Lake adds nothing to its commercial value in this later time, it is a most fascinating tale of the intense feverish energy which marked the culmination of the mining activity in the West. It was huilt on the success of the near-hy Comstock lode development and out of the surplus of attention which it was then receiving. It was for a time supposed that it would be another Comstock.

The first work in the locality was the construction of the Meadow Lake reservoir hy the South Yuha Ditch Co. in 1856. This work was done to provide a continuous water supply to the placer mines at Dutch Flat, Little York, You Bet and Red Dog, which were located 30 miles or so westward. The huilders of the reservoir missed the discovery of the gold-hearing ledges, which were close to the site of the dam they constructed. Five years later, in June, 1863, the first discovery of gold-hearing ledges was made hy Henry Hartley. Hartley, it seems, observed a number of ledges traversing the country ahout three-quarters of a mile from Meadow lake. In Septemher of the same year, with two prospectors, John Simons and Henry Feutel, Hartley made the first mining locations, locating 2000 feet on each parallel vein, naming them Union No. 1 and Union No. 2, forming part of what is now known as the Excelsior group. These ledges are traceahle northwesterly and southeasterly fully 1 mile, the bedrock showing hare for thousands of feet in all directions, there heing no surface covering, except in low hottoms and higher up on the flat slopes. The quartz on the surface is stained a dark reddish hrown hy the oxide of iron derived from the gold-hearing pyrites. In many places the decomposed pyrite was filled with fine gold. Every experiment these prospectors made with their pans and horns added to their first impressions of the richness of their discovery.

This company was the only one in the district until the summer of 1864, when the California Co. discovered and located the California (now the Century), the Knickerhocker (now the Hercules) and two others. These locations covered 1700 feet on each of four very prominent ledges.

In the summer of 1865 puhlic attention was attracted to this camp and the first movement towards it was from Virginia City, Nev. Rumors had reached that place of rich prospects struck on the summits of the Sierras and of vast ledges showing anywhere on their surface free gold. From June, 1865, until late in the fall of 1866 hundreds stampeded to the new district. Cahins were built on the shore of Meadow lake and the place became known as Summit City. At the first miners' meeting, held in July, 1865, boundaries for the new district and the name of Meadow Lake were adopted. Stakes with notices rapidly covered the country, and every mass of rocks which hore the slightest resemhlance to a ledge was claimed and located. Fully 1200 locations are said to have heen made during the summer of 1865, containing in the aggregate more than 1,200,000 feet of ledges. At this time Meadow Lake was surveyed and laid out as a town. Lots were sold at $25 each. Before the winter of 1865-66 set in more than 150 houses had heen huilt, and a city with stores, saloons, three hotels, gamhling houses, hank, hrewery, two daily papers and an express office was estahlished. In the spring of 1866 the town was incorporated as Meadow Lake. It is estimated that over 3000 people visited the district during the summer of 1865, creating a season of transient prosperity.

Among the many locations made, several of more than ordinary richness were partially developed and worked, with such facilities and knowledge as the times provided. These yielded profitahle returns, the ores showing values ranging from $20 to $100 gold per ton. Very little work other than what was necessary to hold the claims was done on the other claims during that year. Winter drove out the crowd, about 200 persons remaining through it.

In May, 1866, the rush started in again, and by the end of June fully 4000 people had visited Meadow Lake. The excitement was intense. Town lots were held at $1500 to $2500, and in some cases actually sold at the latter figure. Small houses rented as high as $200 per month. There were four saw mills in the district and lumber sold for $50 to $75 per thousand. During July four or five hundred frame houses were erected, some of them handsome and suhstantial. In June a stock hoard, with thirty-nine memhers, was estahlished. The excitement in the district was, however, short lived. A reaction followed, and the district experienced a decadence as rapid and quite as unreasonahle as its rise. A few men went to work persistently on their claims. Four good roads were opened. One to Bowman's station on the South Eureka hranch of the Henness Pass; another to Jaction; a third to intersect the main Henness Pass at a point near Weher lake, and the fourth to Cisco, then the terminus of Central Pacific R. R., 11 miles distant, bringing the district within a day's ride of San Francisco. From Meadow Lake to Truckee, via Weher lake, the distance is ahout 33 miles over an excellent mountain road.

Development work continued on some thirty claims and depths of 20 feet to 200 feet were reached. Several mills were erected and one or two roasting works, also a small chlorination plant. The surface ores were oxydized and yielded the gold to a fair degree. Arrastras were worked successfully. The ores were milled in the simplest manner; amalgamation was performed in the mortars and blankets were used to save such values as passed through the screens; the tailings were passed on to the tailings dump. Concentrating machinery was practically unknown in those days, and it was a prohlem among the millmen how to get rid of the metals which interfered with the amalgamation. In this district the millmen came from the State of Nevada and their knowledge was derived from experience in the milling of silver ores.

When the oxydized and readily amalgamahle ores were worked out in the several openings under way the sulphide ores under them would not yield values to amalgamation. Sulphurets containing hy assay $50 to $60 gold per ton yielded scarcely anything. The ores were declared to he "rebellious," "refractory," "hase"; the gold, it was said, was coated with some transparent varnish-like or invisihle material which prevented amalgamation, and that the ores could only he worked by some unknown and to he discovered process. New machinery was erected, mechanical and chemical experiments were installed, and Meadow Lake became a honeyard of processes, the failure of each adding another confirmation to the already declared opinions. Repeated failures rapidly drove the population away. It went as from a plague and left hehind it all its goods and chattels. For twenty years and more afterward the town of Meadow Lake stood deserted, the houses with their furniture, mills with their machinery, all ahandoned, and the common property of the few cattle herders and campers who went in every summer. One man, Hartley, the original discoverer, remained in the old deserted camp with unshaken faith in its ultimate success. During this period Hartley, with a 10-stamp mill on the Excelsior mines, made some successful runs.

In 1895 Bruner & Hirsch leased the Washington mine on Old Man mountain. They installed an aerial wire cahle, 2650 feet in length, from the top of the mountain to the foot at the little camp of Carlyle. The cahle line was poorly erected and failed to accomplish its purpose in time hefore the lease expired. However, they shipped several carloads of ore which, while it was an expensive method on account of transportation expenses to the smelter, more than paid expenses.

In 1898 Messrs. Giffen, Butt & Gay hegan working on the Pennsylvania, at Carlyle, and instead of attempting to ship ore or to employ some complex and expensive method of ore reduction, they made careful and thorough tests, the results of which proved conclusively that wet crushing, good clean plates and first-class concentrating machinery would save the values in the ore.

They organized the Girard Mining Co., and in the summer of 1901 they erected an 8-stamp mill, using part of the machinery of the old Grant mill. The power was obtained from the Fordyce creek. Silver-plated plates were put in and a Wilfley concentrator installed. The summer's work with this mill showed a recovery of $18 per ton, with final tailings assaying 50 cents to $1 per ton. The yield from the plates was $5.25 per ton, the remainder of the value being in the concentrates, which assayed from $50 to $60 per ton. The ledge from which this ore was broken runs from 6 feet to 13 feet wide, and everything hetween walls was milled. Much of the ore was unoxidized. This company intend during the coming summer to reconstruct their mill, putting in ten stamps and a cyanide plant, as they have found the concentrates can he profitahly treated hy that process.

In 1897, Capt. E. O. C. Ord and associates organized the Crystal Lake Gold M. Co. This company in 1900 made an exhaustive investigation of the various lodes from Meadow lake on the east to Old Man mountain and Red mountain on the west, covering a width of ahout 4 miles and extending as far north as Baltimore and to Fordyce lake and Red mountain on the south. The investigation embraced in detail the character of the ledges, the gold and other values contained, the percentage of concentrates; and ore taken from ledges widely separated was shipped for smelting and mill tests. The results in every case showed that gold values were in the ore, and that they could he readily and profitably extracted from hoth the ore and the concentrates. Further tests were made to ascertain to what extent the ores could he treated and the gold extracted hy chlorination and hy cyaniding. The results of the latter were in the main satisfactory.

The Crystal Lake G. M. Co., since the conclusion of these investigations, has installed a 10-stamp mill on the Excelsior group of mines, completing it ahout the 1st of Decemher, 1901. The mill machinery was huilt hy the Risdon Iron Works of San Francisco, and consists of ten 950-pound stamps, Barbour patent cams, one Blake 8x12 rock crusher, 12 feet silvered apron plates, holster and hack mortar plates, one 72-inch water wheel for hattery, one 18-inch water wheel for concentrators, one 24-inch water wheel for ore hreaker, two 6-foot Johnson concentrators.

The power is ohtained from Meadow lake, the water going to the mill through ahout 4700 feet of 12-inch and 14-inch riveted steel pipe, under a head of 250 feet. The mine is well equipped for winter operations. An air compressor is installed, operating one large and two "haby" machine drills. The track from shaft and crih to mill, ahout 200 feet, is housed over.

The company started a shaft near the mill, and for the first 25 feet or more the ore showed values of over $25 per ton gold. In the tunnel now heing run to tap this shaft ore has heen encountered which assays $30 to $50, and fine specimens of free gold have heen taken from the ledge. The mill has been running ahout three weeks, and is crushing fully two tons per stamp, or over twenty tons per day.

In connection with the milling plant of the Crystal Lake Co., operations for the erection of a 50-ton roasting or oxidizing plant are under way and will be completed in the spring. Crude petroleum is to be employed. Tests made on a 6-ton lot of ore from this district showed after roasting an increase in the amalgamation extraction of 25%.

The Three Sisters mine has a quartz vein fully 6 feet wide, in which much free gold appears; samples from a 6-inch to 18-inch streak assayed $199.27, and frequently 50 cents to $2 per pan are ohtained.

The Fargo, a southeasterly extension of the Three Sisters, shows a well defined ledge, varying from 4 feet to over 6 feet in width. The sulphides are disseminated through a sugary quartz matrix; galena is not infrequent. There are two shafts on the property—one 85 feet and one 90 feet deep. Several lots of ore shipped from the cut near the 90-foot shaft yielded $19.60 gold per ton. About 1500 tons of ore on the ore dump will yield fully $10 per ton, and, heing well oxidized, prohably 65% can he saved on the plates.

The Argo mine shows a strong vein, averaging 4 to 8 feet wide, well mineralized, and assays over

$10 per ton. The Galena mine is distinctive in having the only lode which carries galena ore in any quantity. At the shaft near the dam the galena is massive, 4 to 14 inches wide, accompanied hy a strata 10 to 18 inches wide, showing galena and zinc-blende. Assays from this lode show 8% concentrates; value, $44.75 gold and twelve ounces silver per ton.

The Fargo vein intersects the main, or Century, vein at the southeast end of the Hercules claim, and this lode probably intersects the Excelsior system, 4000 or 5000 feet northwest.

The Iron King lode seems to he a strong and promising vein. At the large cut, near the southeast end of the Hercules, ahout 200 feet of the ledge has been mined out from 3 feet to 15 feet deep, and is 6 to 20 feet wide. Ore from this cut, where the pay is over 5 feet wide, assays $19.50 gold, and from another place in the cut $9 gold. On the dumps of the several openings there are about 2000 tons of ore, much of which is well oxidized and will assay over $10 per ton.

On the Century, owned hy Clark & Cook, the ledge shows larger values. At times copper is present as high as 10%. At the shaft the ledge is over 10 feet wide, and at the bottom of the shaft—about 20 feet deep—gave $9 gold, $1.40 silver; total, $10.40 per ton. About 30 feet helow the shaft is a cut ahout 15 feet deep. Samples yielded over $55 gold, and rich pockets of free-gold specimens have been found several times. In October, 1901, one panful is said to have yielded over $1000 gold. Ore from this cut has been run through ordinary sluice hoxes with riffles and paid well.

In a mill test on ore from Century shaft and cut dump, a sample assayed: Gold, 2.187 oz., value $45 21; silver, 2.77 oz. at 60 cents per oz., value $1.66. Total, $46.87 per ton. Ore crushed and amalgamated and yielded at the rate of: Gold, 1.45 oz., value $29.97; silver, .70 oz., value 42 cents. Total, $30.39 per ton, or 64.8% of the assay value. Tailings were concentrated and gave at the rate of 410 pounds concentrates per ton of ore, or 20.5%. The concentrates assayed: Gold, 2.47 oz., value $51.74; silver, 3 35 oz., value $2.10. Total, $53.84 per ton. The 410 pounds of concentrates are worth $10.91, which is 23.2% of the assay value of original ore. Final tailings assayed: Gold, .29 oz., value $6.02; silver, 1.45 oz., value 87 cents. Total, $6 89 per ton. The total extraction was: By amalgamation, $30.39, or 64.8%; by concentration, $10.91, or 23.2%. Total extraction, $41.30, or 88%. Two other tests on ores from the Century and Hercules claims gave in general the following results:

Samples.	No. 1.	No. 2.
Assay	$20 67	$13 60
Extraction by amalgamation	14 50	8 20
Extraction from concentrates	4 37	3 65
Total extraction	18 77	11 85
Tailing assay	1 90	1 75
Percentage of total recovery	90	86.7
Percentage of recovery on plates	77	69

West and south of Black mountain are the ledges which form the system known as the Excelsior system—a perfect network of veins and spurs which, like all in the district, are visible and easily traceahle for thousands of feet. The character is about the same, although the general course varies somewhat from that in the Meadow lake, or, more particularly, the Century system, the former running more nearly northwest and southeast. These ledges cut the formation at an angle, the strike of the formation heing generally nearer east and west.

The claims in the Excelsior system are shown on the map. The ledges are very strong, well marked with well-defined walls and are quite wide, averaging 4 to 8 feet, and in some places are more than 30 feet. The sulphurets are ahundant and disseminated through the quartz. The country rock formation is the same as obtains throughout this section of the district—igneous and metamorphic. Grano-diorite, hornblende and gneiss are prominent. The veins contain 10% to 20% of sulphides, mispickel, magnetite, some zincblende, considerable iron pyrite and traces of copper. The gold is granular to fine, and apparently evenly disseminated through the matrix. The ore concentrates easily, but it is not easy to hand-sort it. Rich ore is found in many places, and free gold quite frequently shows plainly in the quartz.

On the Cash-on-the-dump the vein will average 6 to 7 feet and in value from $10 to $15 per ton. Very much higher values have been obtained. About 1200 tons of good ore are piled up on the dump alongside the road. This is one claim in a group of four—Cash-on-the-dump, Sedgwick, Hattie and Alice.

The Gold Dollar is farthest down on the ledge and near Fordyce lake. Little development has been done; one shaft, about 10 feet deep, at the center of the claim, about 600 feet higher than the level of the lake, shows a very strong and well defined ledge over 8 feet wide, with a pay shoot 5 feet in width; of this, 1½ feet is a rotten, oxidized gangue and quartz mixed, assays $48.67, and pans well in free gold; the remaining portion of the pay, 3½ feet, is solid, a good character of quartz, the sulphurets disseminated. The average of the whole 5 feet assayed gave $16.50 gold per ton. Like a majority of the ledges in the district, it can be made to yield returns almost from heginning of operations, requiring but little dead work in opening up the ore body.

The Gray Eagle and its southerly extension are located on a portion of the ledge, which shows a remarkable degree of mineralization throughout the length of the lode where exposed, and a width of vein 6 to 20 feet.

The Excelsior, Nos. 1 and 2, and Union, Nos. 1 and 2, are the hest developed in the vicinity, and are prohahly the strongest and, so far as known, show the highest values. These are the properties first discovered hy Hartley and now being worked by the Crystal Lake G. M. Co. Union No. 1 contains 500 linear feet of lode; Excelsior No. 1, 1500 feet; Union No. 2, 500 feet; Excelsior No. 2, 1500 feet. The ledges are nearly parallel and ahout 80 feet apart. Between these ledges and on either side a network of spurs exist, crossing and springing from the main ledges in many places, all well mineralized and carrying varying values. The ledges are visible on the bare rocky surface the entire length of the claim.

The developments on this property are a tunnel, crosscutting the Union No. 1 ledge, and a shaft about 60 feet deep. This work shows a strong ledge ranging in width from 6 to 10 feet. In a cut on this ledge an ore body is exposed 9½ feet wide. Samples assayed give results from $10 to $400 a ton. Alongside and south of the wagon road where it crosses the No. 1 ledge is the south cut, where the Crystal Lake Co. is sinking and drifting. The ledge is over 20 feet wide and has a sharper dip to the southwest than at other points. Ores from this property have heen milled in quantity with results as follows:

5	tons amalgamation only	$ 9 25	per ton.
8	" " "	11 00	"
600	" " "	7 00	"
300	" " "	7 34	"
10	" " "	12 38	"
53	" " and sulphurets.	23 24	"
410	" canvas tables	7 00	"
3	" cyanide (90% recovery)	8 10	"

The Baltimore group, ahout 1½ mile southwest from Meadow Lake, has copper present in the ores to a noticeable degree. On the New Find claim is a ledge ahout 5 feet wide, assaying 9% copper and $1.65 gold. The Alta shows a strong ledge, averaging 4 to 6 feet wide, assaying $1.60 to $2.50 per ton in gold and 6% to 14% copper. The ledge matter is strongly magnetic, deflecting the needle. The Selby claim shows a very strong vein, with a shaft over 70 feet deep. The ore carries $2.06 to $8.06 gold per ton and 1.5% to 2% copper; antimony is also present.

On the Quebec the ledge is 6 to 8 feet wide and assays $4 to $23 gold and as high as 30% copper. A shaft is down 92 feet, and at the bottom the ledge, as far as crosscut, shows a width of 9 feet. The copper ores consist of hornite and other sulphides, with some malachite.

About a mile south lies Old Man mountain, its crest standing at an elevation of 7811 feet above sea level. Crossing this mountain is an important system of ledges, carrying high values in gold and high-grade concentrates.

The Omaha mine (formerly known as the Mohawk & Montreal) was worked in early days. The ledge is from 4 to 6 feet wide and dips southwest ahout 85°. On the shore of the lake stand the ruins of the old 10-stamp mill, and it is stated that one shipment of hullion from the mill was valued at $75,000. It is evident that no concentrates were saved. The tailings now on the old Omaha mill dump contain about 20% concentrates worth over $50 per ton. The Omaha has heen opened hy several tunnels. The ledge was stoped from the middle tunnel to the surface, thus leaving an open cut ahout 200 feet deep and 100 feet long. In this cut or open stope a considerable hody of ore remains, and, where over 4 feet wide, assays $41.55 gold; concentrates 11.5%, value $144.90 gold per ton.

Parallel with the Omaha ledge and within the side lines of the claim lies the Little Philadelphia, a claim 50 feet wide. This ledge seems to be a spur from the main Philadelphia ledge. On top of the mountain on an ore shoot is a shaft about 20 feet deep. The ledge is fully 6 feet wide. The ore shoot pitches southeast on the strike of the vein. The gangue of this vein is a sugary quartz, with a porosity due to oxidized sulphurets. This porous ore assays as high as $154 a ton, and one lot of 2100 pounds assayed $41.34. This latter was milled and yielded on the plate 72% of the assay value. Concentrates 11%, value $28 93.

On the Philadelphia ledge are located four claims, embracing 6000 feet. On the Philadelphia and Yuba claims the ledge is most strongly marked, and the grade of ore higher thau farther down the easterly slope of Old Man mountain. This ledge will average 4 to 6 feet wide and has a slight dip to southwest. On the Yuba claim is a tunnel about 20 feet long. Samples taken across 3 feet of pay assayed $12.40 gold, concentrates 4.25%, value $181.91 gold. Other samples from this place assayed as high as $68 gold per ton.

On top of Old Man mountain, about 600 feet southwest from and parallel with the Philadelphia ledge, is a claim called the Gold Cliff. A sample taken from this ledge assayed $11 gold. The southerly slope of Old Man mountain rises rapidly from the foot, about a quarter of a mile north of Fordyce creek, at an angle of about 50°, to the top. The elevation at the creek is about 5700 feet and the top 7800 feet, a rise of over 2000 feet. On this slope is another system of ledges known as the Carlyle, or Old Man mountain group. These extend in a southeasterly direction, crossing the creek and over the ridge into the Enterprise district—over 1 mile distant. The veins have the same general characteristics which prevail in the Philadelphia ledge. The ledges are well mineralized, averaging 5 to 8 feet in width, and yield values from $10 to as high as $100 gold per ton. The ores are easily milled and the concentrates are amenable to chlorinating or cyaniding. The concentrates carry $40 to $70 gold, and from 15% to 25% of the ore. On the Pennsylvania 10% copper ore is found.

Northwest of Old Man mountain is the Hecla, on which is a shaft over 50 feet deep. The ledge is strong, carries gold-copper as high as 15%, and assays have shown silver as high as thirty ounces per ton.

The Enterprise system is ahout 1 mile southeast of the Carlyle group. In 1866, it is stated, that in the Enterprise mine specimens of great richness showed on the surface. Twenty-four hundred pounds of specimen rock were sold and yielded to the huyers a profit of $4000.

About 2 miles southwest of Old Man mountain and 2½ miles north of Cisco is Red mountain, the highest point of which, Signal Peak, is 7860 feet ahove sea level. Crossing this mountain is a system of ledges, the ores of which differ in many characteristics from the ores in the Meadow Lake or Excelsior systems, and perhaps more nearly resemhle the Old Man mountain ores. The formation is similar to the Sailor canyon formation of the U. S. Geological Survey. The slates are strongly metamorphosed, especially near the contact with the granodiorite. Numerous dikes of phorphyritic rock and small limestone bands traverse the mountain. Calcite is of frequent occurrence in the ores found on the Gen. Otis claim.

The ores of the Otis ledge are heavily mineralized, and contain gold, silver, copper, cobalt (cobaltite), and traces of nickel, and may he classed as high grade. The Gen. Otis claim is situated just north of Signal Peak. On the west slope, south of and parallel with the Otis, is a strong ledge, ahout 300 feet distant, on which is located the Crystal Spring mine. On this a shaft has been sunk 40 feet, showing a ledge 4 to 6 feet wide. The Otis ledge has been developed in two places, an open cut about 300 feet from the top of the ridge down to the slope, or 250 feet vertically, where the ledge is 12 to 15 feet wide, the "pay" ahout 6 feet wide. The ledge is exposed about 6 feet deep, is heavily mineralized, containing over 20% of sulphurets, and assaying $30 gold, copper 4%.

A 1000-pound lot of this ore hy stamp milling yielded at the rate per ton in gold, $23.51, silver 24 cents; or 68% of the assay, which was, gold $33.07, silver $1.68 and copper 3%. The concentrates amounted to 33.6%, which assayed, gold $24.80, silver $1.92, and copper 6.5% per ton. Reduced to the original ore the gold would he $8.34, silver 64 cents and copper 2.15%. The loss in the final tails was, gold $1.24, silver 80 cents and copper $\frac{85}{100}$ of 1% per ton. The recovery can then he estimated as, gold 96.3%, silver 52.5%, copper 70%.

A chlorination test on the same lot of ore yielded, gold $30.79, silver $1.08, total $31.87 per ton, or 91% of the original value of the ore. Another lot of the ore was given a chloridizing roast with salt and 87% (fifty-four pounds per ton) of the copper contents extracted by leaching with water. The loss in roasting was about 3%.

Lots of several tons of this ore have heen given an oxidizing treatment in the roasting furnace, and after treatment it was found that 87% of the original value in gold could he saved hy amalgamation.

In conclusion it would seem that the Meadow Lake district offers considerable inducement for investigation and investment. The roads are built, comparatively little expense to he incurred in putting such of the roads as need it in good condition. While the snowfall is heavy in some winters, yet there is no climatic condition to prevent continuous operations in mining and milling. The district is within easy reach of the railroad; there is an abundance of timber for fuel and building purposes; water is abundant and cheap and can be delivered under excellent heads. Labor is no higher than at Nevada City or Grass Valley, and finally, pay ore is present in large quantity, and the extraction of the gold is practicable by ordinary, well known, simple and inexpensive methods.

Ankylostomiasis.

There is a disease which attacks laborers in tunnels and mines. It is as old as Egyt, but only recently has it been traced to a specific parasite. It is a painful and dangerous disease, resulting sometimes in death. A monograph on the subject of this malady, called ankylostomiasis, has been prepared hy H. F. Goldman, official physician in the coal mines of Brennberg, near Oldenburg, Germany. It attacks not only men, but animals, especially the horses and mules used in the building of tunnels and the operation of mines. It is caught by infection, like typhoid or cholera. It may he contracted in the air or by contact with the germs, which are really the eggs of the little worms, or ankylostoma, as it is called. This name means "hooked mouth," and refers to the six hooked teeth around the mouth of the

parasite, by which it clings to the interior of the human intestine. It is found, not only in the duodenum, but also in the smaller intestines, where it grows and flourishes. Male and female can be distinguished among the parasites, the females being larger and more numerous than the males. The males grow to the length of .3937 inch, and the female is on the average half as long again. They can be seen with the naked eye. This animal has neither breathing apparatus nor circulatory system, and varies in color from grayish white to brown, and even blood red, according to the conditions of the person in whom it is found. The female lays a large number of eggs in the human intestines, from which they spread the disease infinitely under proper conditions. The parasite and the egg develop best in a temperature between 65° and 85° F. It is on account of the moisture and heat to be found in mines and tunnels that this parasite develops. Darkness is also necessary, sunlight killing these animalculæ almost instantly.

Gold Placers of Nome, Alaska.*

An examination of the geological map of the Seward Peninsula, Alaska, will show that the important placers have a certain zonal arrangement, and, broadly speaking, group themselves into belts which have a northeasterly-southwesterly extension. The southern belt includes the auriferous deposits of Cripple river, the Nome region, the Kruzamepa valley and the drainage basins of Solomon and Niukluk rivers. The northern belt embraces the placers of the Bluestone, the Agiapuk and the Kugruk. These two zones are separated by the Kigluaik mountains and the Bendelehen group. The relation of the York region to the others has not been determined. These, with those reported from the Arctic coast, may form a third belt. Broadly speaking, the mountains owe their origin to the uplifts and to the intrusion of larger masses of granitic rock along their axes. One result of this structure is a duplication of the same metamorphic series on both sides of the range. As the placer gold is derived from these metamorphic series, its distribution will be effected by their occurrence, and there result two zones of placers corresponding with the two belts of gold-bearing bedrock. While these two areas lying on either side of the anticlinal uplift, which is the dominant structural feature in the region, can be claimed as auriferous, the writer does not wish to imply that the entire area of these two belts will carry workable deposits of gold. On the contrary, the facts indicate that the gold belts are not continuous.

Local Distribution of Placers.—The detailed descriptions which have been given lead to the conclusion that within these two zones only certain creeks seem to carry placer-gold values; some others carry colors of gold, while from many gold is, as far as known, entirely absent. These facts are so well known in the region by every intelligent prospector that they do not need to be here exemplified. The question arises: What is the reason for this irregular distribution of the placer gold? In answer, we must consider, first, the source of the gold, meaning thereby its immediate source in the bedrock, and, second, the manner in which the gold has reached its present position in the placer.

Local Origin of Gold.—In the discussion of the source of the gold the most serious difficulty is that the bedrock geology is not yet known in sufficient detail to afford a good foundation of fact. In a previous publication Mr. Schrader and the writer made the statement that the Anvil creek gold was of local origin. The studies of the last season would confirm this view and would extend it to include practically all the placers of the region. We are led to this conclusion by the character of the drainage basins, of the gold itself, and of the gravels with which it is associated. In nearly every instance the source of the gravel of any given auriferous deposit can be assigned to a local cause. Local origin, being only a relative term, does not admit of any exact definition. In most of the gulch placers the gold is believed to have its source in the drainage basin of the streams in which it is found. In the case of deposits that belong to an older drainage system, the same is true of the gold of their drainage basins. In the gravel plain and beach placers, local origin for the gold implies that the source is in drainage basins of the streams of the immediate vicinity, and that it has reached its present position by water transportation. Many theories are popular among the miners, which involve a glacial, volcanic and even meteoric origin for the gold. The facts to be presented will show that no such agencies have played any part in the formation of the placers.

Occurrence of Gold in Bedrock.—In many instances gold is found attached to fragments of vein quartz or of schist, showing conclusively that it is of vein origin or from impregnated zones. Assays have shown that traces of gold and silver are quite common in the veins and mineralized schists of the shear zones. In a few cases veins were assayed which carried commercial values, but they are relatively rare.

Derivation of Placer Gold.—These facts point to the conclusion that the placer gold of Seward Peninsula has its source in veins and impregnated beds which occurred close to the present location of the placers. The mechanical destruction of the bedrock and its included veins and mineralized zones has set the gold free, and it has been subsequently concentrated in the gravel deposits where it is now found.

It has been noted that in some localities there is evidence of an older drainage system and that the source of the gold is not, necessarily, to be sought within the drainage basin in which it is now found. The main point which seems to be established is that the gold has not been brought far and that its source is within bedrock identical in character with that which is now exposed.

Concentration of Gold in Placers.—The question is often asked: If the gold be of local origin, why is it that there are such rich placers in a region where the quartz veins seldom carry values, and, in fact, are often entirely barren of gold? This is a practical question and one which it is not always easy to answer. To tell the average miner and prospector that the gold has been concentrated out of a very large amount of bedrock, is but to state to him a fact of which he is already well aware. At the same time, one who is not accustomed to measure time in terms of geology can not, as a rule, easily conceive what geological time signifies. The average man knows by his own observations that rivers and streams erode their channels, and that the topography is more or less the result of erosion; but, unless he has made a study of the matter, he will hardly realize that nearly all topographic forms are due to destructive rather than constructive agencies, and that any given river system has been gradually developed by the erosive forces. Thus, in the region under discussion, the rivers and streams have incised their present valleys into what was, presumably, at one time, a nearly level surface. The thickness of material removed is to be measured in hundreds of feet, and, in some cases, in thousands. The amount of material removed, measured horizontally, varies, of course, with the size of the drainage basin. It is easy to see that in the carving out of a drainage system, such as that of Anvil creek, for instance, a very large amount of material has been removed, carried out and redeposited outside of the basin itself. The gold contained in this mass of bedrock, which has been gradually carried away by stream and frost action, remains, since it is, comparatively speaking, indestructible; while the parent rock in which it was contained has been ground up, dissolved and washed away. This gold is sorted by the water, accumulates and forms placers.

The chief reason why more veins are not found in the region is because much of the gold was widely disseminated in small quartz stringers and in impregnated zones of the bedrock. It was not derived from a mother lode, but in the course of the destruction of the bedrock the gold thus widely disseminated in small veins was concentrated in the sands and gravels. This does not by any means preclude the possibility of the presence of workable quartz veins in the region. In fact, some veins and impregnated zones carrying values have already been discovered. Compared with the amount of material which has been removed and destroyed, the amount of bedrock now exposed and accessible to the miner and prospector bears a relation of something like a thousand to one, if not a million to one. We have access to bedrock only along the stream channels and along valley walls. It is easy to see that the surface exposed, especially considering the thick coating of moss, which nearly everywhere hides the underlying rock, is but a small fraction of the amount which must have been removed during the formation of a stream valley.

A New Method of Prospecting for Gold and Silver at a Great Depth.

To the Editor:—The Comstock, Virginia, Nevada, has had many ups and downs. People connected with the lode once thought that the ore bodies had given out and just about that time always something new turned up to resurrect the old lode. Con. Cal. & Va., which was supposed to have seen its best days in 1879, came to the front again as an ore producer in 1886, and between 1886 and 1890 the mine produced about $14,000,000. Once more after that a small deposit of ore was found in the upper levels. About two years ago a movement was made and successfully carried out to unwater the Lode, and which so far has proven a great success, inasmuch as it enabled C. C. & Va. to become an ore producer again. Several years ago the Comstock mining companies purchased ground about one-half mile to the eastward, and which is now known as the Brunswick Lode. Two shafts were started, one on the ground belonging to the Best & Belcher and C. C. & Va., and one belonging to the Chollar, Potosi and Norcross. After going to a depth of 200 feet they encountered a body of ore in the Chollar which produced over $200,000. They continued sinking a shaft to a depth of 1000 feet, opened several levels, and, although the ledge retained its regular dip and size, the quartz encountered carried but little value.

These quartz bodies in the Chollar were evidently making to the south and when the drift from the Chollar ground was in about 300 feet in Potosi ground it encountered a body of quartz about 40 feet wide of low-grade ore. Circumstances over which the mining companies had no control prevented them from exploiting this body of quartz, and it is this that they are trying to prove with a new drill called the Davis Calyx Drill.

Seven Comstock companies owning ground on this East Lode, or what is called the Brunswick Lode, jointly bought one of these drills and concluded to make the first attempt to test the efficiency of the drill on the Potosi ground. The idea is to cut the downward continuation of the quartz body found on the 600-foot level at a depth of 850 feet. The inventor of the drill, F. H. Davis, considered the work of such great importance that he has come especially from New York to superintend the setting up of the drill and will likely remain until the hole is completed. The drill is expected to make from 20 to 40 feet in twenty-four hours.

People familiar with the Comstock know of the existence of ore bodies in some of the mines on the Comstock in the lower levels, now being under water. The expense of unwatering the whole lode is so large that it requires an actual demonstration of the existence of ore in these lower levels to induce the shareholders to pay assessments toward raising money to unwater these mines. It is expected that this drill will demonstrate at small comparative expense whether an ore body exists in the lower levels or not. Everybody connected with the Comstock is watching with a great deal of interest the workings of this new drill. Comstock.

Virginia, Nev., Jan. 18.

The Godbe Agitation Method of Leaching.

This is a new method, recently patented, of leaching fine or slimy ores by agitation and the separation of the solution from the ore.

It is a well known fact that the finer an ore is pulverized the higher is the extraction by the cyanide solution; but it is also well known that very fine or talcy ore can not be successfully leached by the ordinary method of percolation, owing to the material becoming so packed down that it will not permit the solution to pass through it. A much more thorough and perfect dissolving of the metals is obtained by stirring or agitating the pulp in the solution; but the difficulty has been to economically and completely extract or separate the gold-bearing solution from the fine ore or slime after solution was completed. This is the difficulty that the Godbe process overcomes.

The process consists of a combination of agitation and upward percolation, simultaneously, in the same vat. The pulp is stirred with a cyanide solution, containing lime, in a circular vat, the diameter of which is not greater than the depth, and, while being so stirred, a stream of solution is introduced from below through a false filter bottom and rises up through the agitated and suspended ore, and overflows at the top perfectly clear and free from slime. To do this the miller or stirrer is placed close to the bottom of the vat and does not revolve fast enough to throw the slime up to the surface of the charge, but just sufficient to keep the entire mass in suspension and flowing around in the tank, and, at the same time, always leave a few inches depth of perfectly clear solution at the top. The solution in its upward course makes an intimate contact with every particle of slime, as the latter is constantly changing its position in the tank and rises above the mass as clear solution at the top. The overflow of solution is ready for precipitation.

During the period of dissolving the gold the speed of the stirrer is increased so that the entire charge is in thorough agitation, and at this stage compressed air can be blown in to hasten the dissolution of the gold if the ore requires it. After the solution of the metal has been effected, the gold-bearing solution is washed out of the slimes by displacement with weak solution, until all the gold-bearing solution has been washed out of the charge, and in turn the weak cyanide solution is displaced with water. Finally a plug is drawn and the tailings allowed to run out through the bottom. Each displacement operation washes out about 80% of the solution contained, so that it generally takes three displacements—two of solution and one of water—to recover practically all the gold-bearing solution from the charge. These displacements, however, take place very rapidly, from four to six hours only being required for each one. The amount of solution to ore varies according to the specific gravity of the slime, being from 1.2 to as high as 3 parts of solution to 1 of ore. When used in connection with plate amalgamation, no settling is required, as the water is withdrawn by displacement with the cyanide solution. One important feature is that by using a large quantity of solution, which can be done, the upward percolation taking place so rapidly, a very much weaker solution can be used and still bring the proper or necessary amount of cyanide of potassium in contact with the metals to be dissolved, thereby reducing the loss of cyanide to a minimum, both as to the loss of the latter in attacking base metals and to the ordinary losses of solution. A warm solution greatly assists the operation, mechanically and chemically.

Mine and Mill Work at Hedges, Cal.*

[STAFF CORRESPONDENCE.]

The gold mine at Hedges, San Diego county, Cal., is in a spur of the San Bernardino range, 5 milles north of Ogilby station on the Southern Pacific road. The mine is a bedded ore hody that dips 33° east, with a north and south strike. The country rock is a schist. The vein walls are not well defined, the vein matter appearing to merge into the general formation. The ores carry some free gold that pans and amalgamates, also a considerable amount of a flour fineness that requires cyaniding to recover. These values are in a matrix of dark and white quartz, schist and granitic rock with more or less magnetic iron through it all. They carry a small amount of silver and copper and are stained with epidote in places.

The main property, called the Golden Cross, is opened by an incline that coincides with the general pitch of the formation, and which sinks to a depth of 1100 feet. From each 100-foot station a drift runs northward into the ore body, which adjacent to the shaft is pretty well stoped out from the 900-foot station to the surface, the stopes heing timbered with square sets from level to level. At each level is a dumping hin over the incline which discharges into the skip.

As new work is opened a winze is made in ore from one level to another, which estahlishes good air circulation. Present new work is between the ninth and tenth levels and on the eleventh. The production from the stopes ahove the tenth shows as rich ore as at any level ahove it. The ores at this depth comprise more of a white quartz than those from higher levels. At the 200 level there are a numher of chutes that convey the ore from the deep excavations at the surface. These chutes load into cars which carry the ore to the incline skips. From the 200 level a crosscut is being run several hundred feet southeastward to open another ore body which has some surface work. John Malone is mine superintendent.

The incline skip dumps the ore into hins, which load into tramcars, the latter carrying it to Gates crusher, located hetween the shaft and mill. A hoisting tramline conveys the ore from crusher to the mill hins, which feed automatically into hatteries of the 100-stamp mill. This is huilt in two sections—fifty stamps on each side, with the ore hins above and hetween them. The stamps are 1000 pounds weight, drop ninety-six, and crush four and one-half tons of ore per twenty-four hours. The screens are the No. 10 diagonal, slot-punched, equivalent to ahout 40-mesh. Below each hattery is a copper amalgam plate, 28 feet long, with a fall of 1½ inches to the foot. Mill superintendent R. R. Wheeler states that 70% of the total saving is made on the plates.

At the mill are four 100 H. P. hoilers, wood heing used as fuel. These drive a 300 H. P. mill engine. Besides the mill machinery and dynamo for light, this engine drives a 10-drill air compressor.

The mill has heen operated for over five years, and the impounded tailings from it now cover several acres, from 20 to 30 feet deep. A cyanide plant estahlished later is now operating on the accumulations of the first two or three years. This plant consists of five steel leaching vats, 300 tons capacity each, with four hottom-discharge doors, hy which the pulp is sluiced out to the wash helow; two 180-ton standardizing tanks, precipitating room, and two 180-ton sump tanks. It requires seven to eight hours to fill each tank, in which a three-pound solution is used for first treatment. The consumption of cyanide amounts to six-tenths to seven-tenths of a pound per ton of pulp. The presence of ahout $\frac{7}{10}$ of 1% of copper increases the requirement of cyanide. The zinc consumption amounts to one-tenth of a pound per ton of pulp. To neutralize the acids in the pulp ahout two pounds of slacked lime are added before leaching. H. W. Durrell, in charge of the cyanide plant, says: "In the cleanup the precipitates are carried hy launders to two vacuum filters and from here are carried to a two-ton lead-lined acid tank. After sulphuric acid treatment the precipitates are dried and given a thorough oxidizing roast. They are then given a treatment with dilute sulphuric (to remove copper), washed and dried. The resulting precipitates are easily fluxed and give a hullion from 920 to 940 fine."

In impounding the tailings an effort is made to keep separate the slimes from the more siliceous matter. The former heing of a clay-like consistency are a hindrance to percolation in the cyanide work.

This property, formerly known as the Golden Cross mine, now belongs to the Free Gold M. Co., of which Chas. W. Pauly is manager. Mr. Pauly states that the cost of mining and milling is within $1.25 per ton of ore; and that the cyanide work costs not over 50 cents per ton of pulp handled.

The water supply for the camp is pumped from a well at the Colorado river, 12 miles away, ahout 250,000 gallons per twenty-four hours heing delivered to a reservoir near the mill. At the pump station is a 60 H. P. Corliss engine, geared to a power pump. In this direction the water is raised 630 feet and conveyed through a 6-inch pipe.

Hedges, Cal., Jan. 2., 1902.

* See illustration on f.ont page.

Electric Locomotives.

Some interesting types of electric locomotives are herewith illustrated. The locomotive shown in Fig. 1 is intended for traction service in factories ahout mines where heavy material is to he moved on narrow-gauge cars. It is adaptahle for curves with a radius as small as 12 feet. The engine is carried on two swiveling eight-wheel trucks, with every wheel a driver, which enahles it to ascend steep grades. With a machine adapted to such short curves and steep grades almost any part of a factory may he reached.

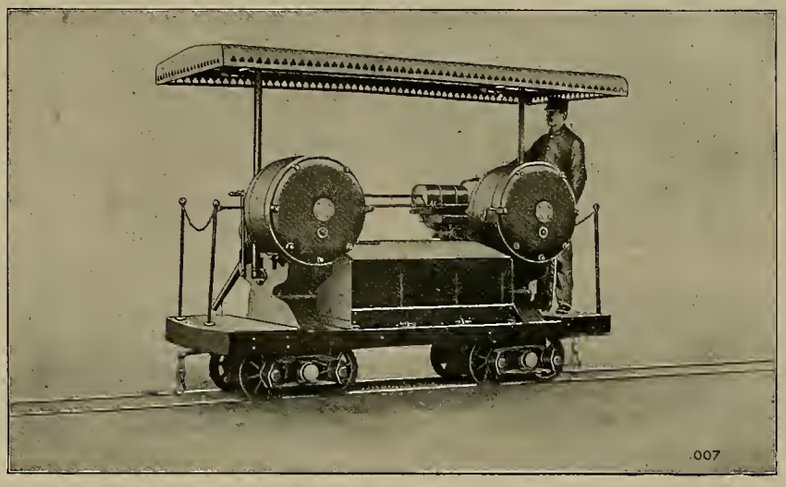

Fig. 1.—Electric Locomotive.

The locomotive makes a most economical use of power. When not at work no power is used. If it is at work just the power needed to do the work is taken. In service one man handles the locomotive, and usually does the coupling.

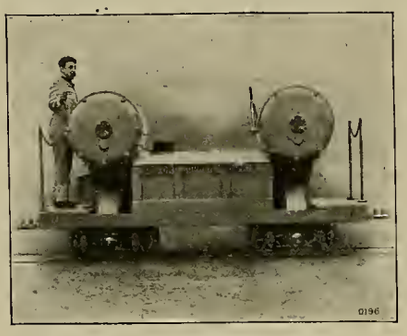

Fig. 2.—Electric Locomotive Without Cover.

The motive power for operation is furnished hy a storage battery, which is recharged at night, or during the day when the locomotive is idle. The daily recharging of the batteries, the manufacturers claim, requires ahout one-quarter as much time as the locomotive is in active work during the day.

The storage hattery on the locomotive is divided into sections, which are connected through the controller with the motor armatures and fields in various combinations of series-parallel connections, thus obtaining the different variations of draw-har pull and speed required for general shop work. Usually large and heavy hattery plates are used, which are not overworked even in starting the load, thus ensuring durahility and efficiency of the lead plates.

There are no rheostats or resistances of any kind, thus avoiding waste of electric energy either in starting or in running. The motors are proportioned to the normal output of the batteries, and to the weight of the locomotive so as to avoid overloading by the motorman.

Two independent electric motors are used, either in series or multiple, which at low speeds are said to give a large starting effort with a minimum consumption of electric current. It is evident that any increase in the efficiency of either the motors or the mechanism is equivalent to increasing the life of the batteries and the radius of action of the locomotive. These motors are said to possess the valuahle quality of pulling the hardest when the load is heing started and the speed is the slowest, and lessening the pull and increasing their speed as the car is accelerated.

In Fig. 2 and in Fig. 3 are shown the same locomotive without the canopy top.

The following figures show the structural and operative features: The approximate weight of the locomotive in running order is 5 tons; gauge of track outside of rail heads (Hunt standard), 21½ inches; Length of locomotive, over all, 13 feet; width of locomotive, over all, 52 inches; height of locomotive, over all, without canopy, 66 inches; height of locomotive, over all, with canopy, 100 inches; height of draw-har above the rail head, 13½ inches; speed per hour, variahle from 1 to 4 miles; range, in the usual run of shop and yard work, 10 hours.

The manufacturers also manufacture a type of electric switching locomotive for use on standard gauge track. The power for these locomotives is also furnished from storage hatteries and they are manufactured with different capacities for the purpose of meeting the variety of service required in yard work. They are huilt in accordance with the Master Car Builders' standards, and two motors used for driving them are so arranged as to make every wheel a driving wheel. By using storage batteries they are made much heavier than they would be if trolleys were used, but in this case the weight is considered an advantage, as it enahles them to pull much heavier loads.

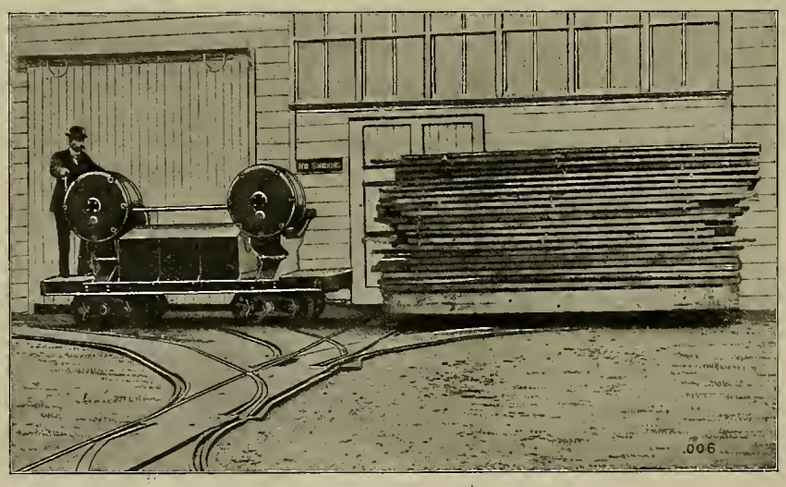

Fig. 3.—Standard Storage Battery Electric Locomotive in Service.

Telephone Troubles and How to Find Them.*

By P. Kerr Higgins, A. M. I. E. E.

Telephone trouble men are, as a rule, like poets and artists, born, not made, but the average man can, with patience and earnest effort, become quite expert at the work. A good telephone trouble man will understand not only troubles in instruments, but also in lines, cables, switchboards, etc. In short, his duties make him efficient in the whole trouble department. A line is usually drawn between the construction and the maintenance departments; this article will deal exclusively with the latter.

The first duty of the inspector, or "trouble man," is to become thoroughly acquainted with the circuit or circuits in which troubles may be expected to exist. Diagnosis is one of the first things he has to learn; he must get all the facts he can, put them together and then reason out what can and what can not cause the trouble, and this he must do before he touches the apparatus under his care. It is to be regretted that the majority of trouble men, instead of using reason and the thinking power God has given them, go after trouble in a blind manner, trusting to "luck" to find it, many of them doing more damage in one hour than can be set right in a week; and what is worse still, their carelessness is seldom found out until they have ruined the apparatus entrusted to them. Let me emphasize, then, the necessity of knowing what you are looking for and where the trouble is likely to occur before you begin dissecting the apparatus.

A telephone plant is divided into four great parts: (1) Instruments, (2) wires, (3) cables, (4) switchboards and their accessories, and the treatment and methods for location of trouble in them are very nearly the same, at least so far as the principle is concerned.

No man can properly clear trouble without tools. It can be done in a slipshod way, but not so as to give satisfaction. Show me a man's kit of tools, and by the selection and their condition I will tell you what kind of workman he is. His tools will depend on the class of work he is called upon to perform; usually the trouble man is an all-round man, and has a lineman's outfit as well as his instrument outfit. Seldom, however, if ever, are men called upon to attend to all four sections, so we will divide the trouble into two main sections: (1) Line and instruments; (2) cables and switch-room apparatus. The following list of tools will be found very handy and, although not complete for all work, it may be added to only as found necessary: One pair, 5 inches long, nosed pliers; one small hammer; three screwdrivers, 6 inches long, different size blades; one keyhole saw; one set of drills; one pair of tweezers; three small files; one pair diagonal cutting pliers; one box for fuses; one box for screws, tacks, etc.; one ratchet brace; one set bits—$\frac{1}{4}$, $\frac{5}{8}$, $\frac{3}{4}$; one small oil can; emery paper, crocus cloth; black tape (Manson); one small detector.

Instrument Troubles. — An instrument is composed of four parts: (1) The calling apparatus, (2) the receiver, (3) the transmitter, (4) the battery.

Calling Apparatus.—Calling apparatus is divided into two systems: (1) Battery, (2) magneto. In the battery system the call is usually made by depressing a button which sends the current out to the line in one of two ways (see Fig. 1). Either from a

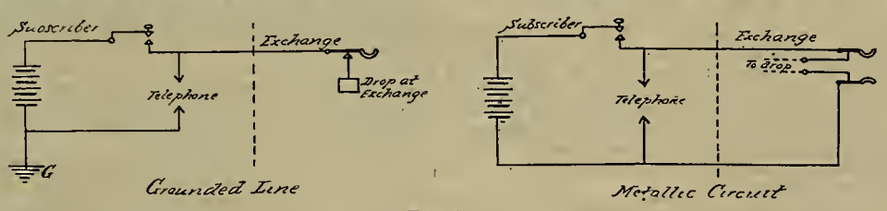

Fig. 1.

ground to a ground (a) or in the form of a metallic circuit (b), the circuit is simple and may easily be traced.

Trouble on such may be (1) weak or insufficient battery power, (2) wire broken, short-circuited or grounded, (3) a defect in the button or in the indicator at exchange end. A wire is short-circuited when the circuit is closed before reaching its destination and the term is only applied to a metallic circuit (wholly of metal, with no connection to the ground). To locate the trouble, disconnect the outgoing wire at the point where it leaves the building and apply a small detector (a battery buzzer or bell will do), to the ends of the inside wire; then depress the button, and if everything is right inside the bell will ring.

We will assume the trouble is inside, and the bell does not ring. Now take your detector to battery and see if it will ring there; if not, test out each cell separately until you find the defective one and renew it, or fix the broken pole or connection, as the case may be; if on testing you find the battery "O. K.," then tap your detector on your wires at different points until the trouble is found; before doing this, however, make a thorough examination of your wires and you will probably find the break. Sometimes the wire breaks inside the covering and can only be found by testing.

In testing for the trouble, first divide the circuit in halves and then in quarters, and so on, being careful always to start the test beyond the trouble. If on testing, the trouble is found in the indicator, then apply steady battery to the same by fastening down the button, and adjust the indicator until it responds; repair the break, if one is found. When the circuit is grounded, trouble is often caused by water or moisture on the wire; if the wire is exposed, it may also be due to a broken insulator allowing the current to pass to ground before reaching the exchange. Trouble in vibrating bells is either due to bad adjustment or broken or crossed wires.

Magnetos.—Two methods of testing the generator are used: (1) The fingers may be placed on the terminals, the crank turned, and, if the generator is in working order, a shock will be felt. I prefer this method of testing, as, if the magneto is bridged, the ringer might be open and the generator O. K. Another method is to place a piece of metal across the terminals, and turn the crank; if the bell rings it is O. K., if not, trouble is inside, but, as stated before, in the case of a bridging bell, this is not specific, and the former test should be made first, then the latter. The latter test then, we will assume, has been made, and the bells ring clear and strong, but when tried on another instrument or indicator will not work; the fingers were placed over the terminals, and the current seemed strong, then wires were taken off the terminals and it tested clear (bells not ringing). We take it apart and examine it closely, and find that trouble is due to the cutout not working properly on the armature. Now suppose, after our tests we receive no shock, the fault will be due to a short circuit (crossed wires), or to a broken wire; if, however, we received a shock, but the bell did not respond, then the fault is in the ringer and may be due to bad adjustment, broken or crossed wires; if the shock is weak, it may be due to defective or weak magnets. All contacts in magnetos should be made and kept tight, and the springs should be examined often, as holes are frequently worn in them and cause trouble. Very little oil should be used, as it is liable to cause trouble. Magneto troubles are usually easy to locate by making the above tests.

The Receiver.—Receiver troubles are mostly due to bad adjustment, dented or bent diaphragm, broken wire or weak magnets. The magnet should hold up eight ounces of metal. It will frequently be found that tampering with the diaphragm through the small aperture, indicated by indentations caused by a pencil, has been done. In this case the only thing to do is to change the diaphragm.

The adjustment of receiver magnets is different in each style. Some have a screw at the end, while in others it is on the inside. A good way to test the adjustment is to lay a long pencil across the earpiece at end of magnets, with the cap and diaphragm off, and adjust magnet so that it is $\frac{1}{32}$ of an inch clear of pencil. A part of the receiver is the cord attaching it to the instrument, and this frequently causes trouble by being broken or having tinsel worn, in which case the aggravating "intermittent" trouble presents itself, and must be patiently looked for and repaired; it is generally caused by the tinsel being worn and making poor contact; it can, as a rule, be found by twisting or pulling the cord while holding receiver to the ear. The interior of the receiver should be kept clear of dust, as also the front of magnets.

Transmitters.—Black style common faults are due to poor adjustment and to a hole being worn in the carbon button; this latter is remedied by rubbing the button on a piece of crocus cloth and then polishing it with a common leadpencil. Another source of trouble is bad contacts, especially at the hinges, and rusty or dented diaphragm.

Solid back or granular carbon style: The most frequent faults in these are packing of the carbon, loose contacts, bad joints or damaged diaphragms. The packing can be remedied by tapping the transmitter lightly on the side, or turning it upside down; it is best not to take it to pieces, unless thoroughly acquainted with its construction, to know which it is best to practice on a defective instrument. Loose contacts have to be cleaned and tightened, or soldered, as the case may be. Damaged diaphragms must always be changed.

Receiver Hook.—The receiver hook, or gravity switch, is the cause of many complaints, which are generally due to dirty contacts or weak springs, and can be found and remedied very easily by cleaning or retempering the springs; the latter may be done by heating the spring to a red heat and then dipping it into water; if this makes too hard a spring, it may be softened slightly by using oil, instead of water.

Battery.—Battery troubles are due to exhausted solution—as shown by the formation of crystals on zinc and carbon elements—impure or worn out zinc, corroded poles or connections.

In renewing batteries do not use more solution than is specified in directions, as it will be more injurious than helpful; always throw away the old solution. In the Fuller cell the solution, when weak, is a very dark color. It is folly to use very cheap zinc, as it generally contains arsenic, or some form of iron, and is known by the honeycombed state of the zinc or its black appearance. Porous cups are past repair when they become rusty in color. All connections should be kept clean and protected from the fumes or acids of the battery. Use soft water in making battery solutions.

Line Trouble.—Troubles on lines are of four kinds: (1) Grounded, (2) crossed, (3) open, (4) cut-out or intermittent trouble. A line is grounded, either wholly or partially, by coming in contact with the earth or any conductor connected to the earth; if the line is long, experience will enable one to know, more or less, the distance of the ground by the amount of noise or induction on it; or it may be tested, as previously stated, with the detector; if a short line, it may be gone over, having the cause in mind. In removing the fault, if due to a slack wire, do not tie the wire back with a string, as is sometimes done, but pull it up and cut out the slack.

A crossed wire is a wire crossed with another circuit. There are two kinds of crossed wires—a true and a false; both are real, but the first is on the line, the other is due to two or more subscribers being connected to a ground, or return, which is or has become defective, and, instead of carrying the current to ground, the resistance being too high, it goes over to the other line or lines. A cross on the line may be found and cleared in the same way as a grounded wire. An open line may be due to a break and will be easily found by going over the route of the line; but, if caused by an open joint, it is not so easily found. To locate this, and many other faults, a trouble man should have a portable instrument, or test set, consisting of a generator and a band telephone, or receiver, which is also used as a transmitter. With this he can go out on the line at any point, connect his test set and call in; he can start in middle of line and test, as already described in the battery test (Fig. 2). If a cut-out or intermittent fault

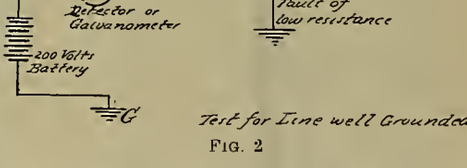

Fig. 2

presents itself, test as previously given, using one cell of battery. To avoid trouble, keep your line routes clear of broken insulators, etc., and avoid having slack wires. Noisy lines, due to cross-talk or induction, may be made quiet by judicious transposing, the number of transpositions necessary being determined by the length of line under treatment, and its proximity to disturbing wires. By transposing, is meant changing the exposed wire at regular intervals from a few inches, as in cables, to every quarter of a mile, as on long lines. (See Fig. 3.)

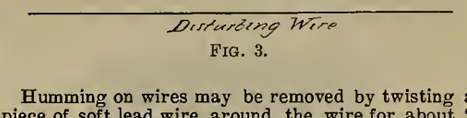

Fig. 3.

Humming on wires may be removed by twisting a piece of soft lead wire around the wire for about 2 feet, near the house or pole, or by placing a piece of flat wood on top and bottom of wire and tying them together.

The Sparse Distribution of Tin.

Tin is the most sparingly distributed metal in common use. In this respect it compares interestingly with gold, the known workable deposits of which cover 1,500,000 square miles, while the workable tin deposits are confined to less than 125,000 square miles; from which it appears that for every square mile of tin ground there are 132 square miles of gold-yielding territory. Furthermore, while there is scarcely a country in the world in which gold might not be profitably obtained, or from which it has not been obtained in the past, there are at the present

*Condensed from The American Telephone Journal.

time probably not more than a dozen districts in the world from which tin is obtained. The tin deposits of Cornwall, famed in history as the source from which the Phœnicians obtained their tin supplies, and which have yielded immense quantities continuously down to the present, are now practically exhausted, and the same may be said of the condition of the ore deposits of Bohemia, Tuscany, southern Spain and the Pyrenees.

In all the vast area of Asia, but two districts are known in which workable deposits of tin exist; namely the Hunan district of China, and the Straits Settlement and adjacent principalities, from the latter of which hy far the largest quantity of the metal has heen ohtained for many years.

Thus far no workable tin deposit has heen discovered in Africa. In North America at present there is not a single tin mine in operation, though promising deposits have been located in at least four widely separated localities, viz.: Virginia, Dakota, California and Alaska. In Mexico extensive deposits of tin are known to exist in the province of Durango; when facilities for transportation are provided they will douhtless add greatly to the world's supply. At present, however, they remain untouched. Brazil, Bolivia and Peru in South America have paying tin ground, but the yield thus far is comparatively small, and is confined to the last-named two States. Lastly, Australasia is the source of a considerahle supply of tin from lately discovered deposits in Australia and New Zealand. At present the product is only ahout one-tenth that of the Straits, but it is steadily increasing.

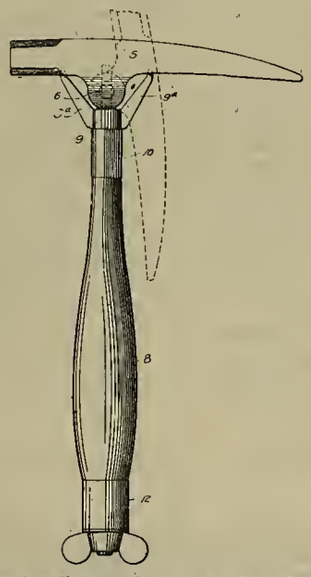
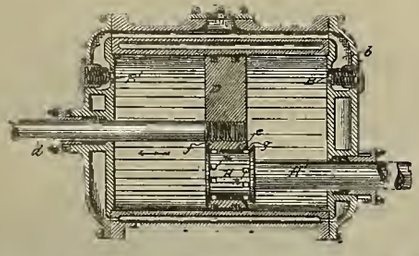
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

PROSPECTOR'S PICK OR SIMILAR TOOL.—No. 691,309; F. S. Goldsmith, Denver, Colo.



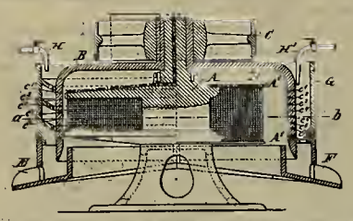
A hollow handle, a rod passing therethrough and protruding at hoth ends, one extremity heing threaded, a tool head hinged or pivoted to one end of rod, a hrace swiveled on rod adjacent head and provided with two arms whose extremities engage recesses formed in head on opposite sides of pivot and in a plane at right angles to axis of pivot, rod being formed polygonal in cross-section adjacent brace, and adjacent handle extremity having counterpart socket in which polygonal part of rod fits, and a nut applied to threaded extremity of rod remote from head for holding assembled parts in position.

PISTON VALVE FOR AIR COMPRESSORS.—No. 691,042; B. L. Brinton and W. P. Brinton, Bradford, Pa.



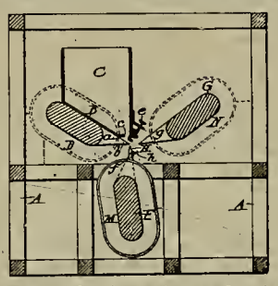
A cylinder, a piston working in cylinder, a piston rod rigidly connected to piston for operating it, a valve traveling with and moved hy piston hut having a limited movement in an opening therein wherehy position of valve is changed at each reversal of direction of travel of piston, and a hollow stem on and movahle with valve working through on opening in one end of cylinder and adapted to communicate with interior of cylinder on one side or other of piston according to position of valve relative to piston.

MAGNETIC SEPARATOR.—No. 691,262; G. Grondal, Pitkaranta, Russia.



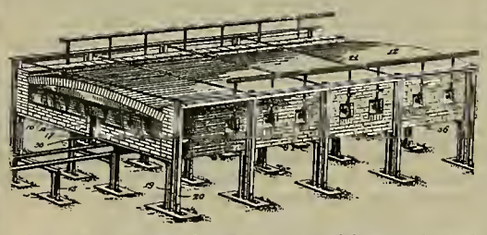
A magnet with a vertical core and circular pole pieces, hut cut away on one side, a cap of non-magnetizable material mounted to revolve around and envelop core and magnet, lamellæ of magnetizable material inserted in cap hut magnetically insulated from each other, means for feeding water with material to he separated, means for revolving cap and means for spraying water on material at weakest magnetic point of revolving cap, water feed and arrangement of lamellæ causing particles to turn during revolution of cap wherehy non-magnetic materials pinned down by the magnetic ones hecomes freed and can he carried off.

MAGNETIC SEPARATOR.—No. 691,007; F. A. M. Schiechel, Frankfort-on-the-Main, Germany.



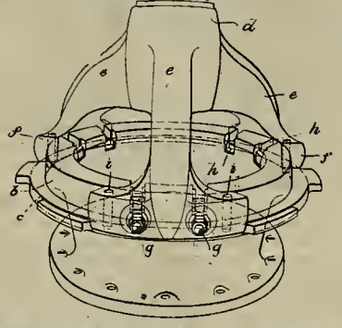
A supply magnet having a tapered pole piece and arranged in a horizontally inclined position so that material to he treated will gravitate over its edge, and a plurality of magnets whose pole pieces are of opposite polarity to that of supply magnet, one of last named magnets having its pole piece arranged helow and in vertical plane of that of supply magnet, and another of last named magnets being arranged in a horizontally inclined position with its pole piece in horizontal plane of that of supply magnet with intervening spaces between respective pole pieces.

ORE ROASTING FURNACE.—No. 691,112; J. P. Cappeau, Joplin, Mo.



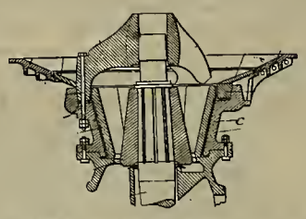
An ore roasting furnace, comprising a hearth having a longitudinally disposed slot in floor for admitting air to hearth; of a rake for stirring and advancing ore; a carrier disposed externally of hearth and connected with rake; a series of gates in slot; and adjustahle means for controlling passage of air through slot into hearth, and mounted to give way to rake operating device during its travel from end to end of furnace.

ROCK OR ORE BREAKER.—No. 691,339; A. J. Gates and T. W. Capen, Chicago, Ill.



The crushing chamher wall of a shoulder upon wall of crushing chamher, a spider comprising a heavy cast stationary hub and heavy arms integral therewith which extend independently outward to wall of crushing chamber and downward to shoulder on it and are seated within recess formed hy shoulder and crushing chamher wall, and means for attaching ends of the arms firmly to shoulder and wall of crushing chamher.

ORE CRUSHER.—No. 691,135; E. E. Hanna, Chicago, Ill.



A main frame portion provided with a recess in upper inner surface, crushing concaves in frame portion, upper ends extending ahove hase of recess to form it into a groove, and a spider portion provided with a hase portion resting in groove and secured therein.

A New Graham County, Ariz., Mine.

[STAFF CORRESPONDENCE.]

The Consolidated Gold Mountain M. Co. of Tucson, Ariz., has acquired a group of twenty claims in the Galiuro mountains, Graham county, 50 miles northwesterly from Wilcox and 30 miles west of Fort Grant. The locations cover about 6000 feet of the strike of a ledge that strikes north and south through quartzite and porphyry formations. By the outcropping this ledge is traceahle about 6 miles in length. Rattlesnake canyon cuts through the ledge at one point, leaving the ore exposed on hoth sides of the canyon, showing width and character of vein matter to a considerable depth. This erosion is taken as the starting point for development work. On one side of the canyon a crosscut has heen made, better exposing the face of ore, and a tunnel drift run on the vein. On the other side of the canyon a second tunnel drift has heen driven on the ledge. This development, as well as some surface work elsewhere, shows the ledge to he at least 250 feet hetween walls, the ore heing quartz, carrying free gold. It is stated that an average of forty samples taken across the vein at different depths showed gold values of $6.10 per ton. The canyon referred to cuts the ledge ahout 250 feet helow the general surface outcrop.

Camp of Consolidated G M. Co., Graham County, Arizona.

The property includes two millsites and two power plant sites. It is claimed the company can develop 1500 H. P., which will he utilized to provide electric power to operate mine and mill machinery. It is stated that plans are now heing made for a 200-stamp mill on the property. The company is made up C. R. Fleming, P. W. Fleming, J. B. Wright and associates.

The same company own the Narragansett mine, east of Helvetia, in Pima county. It is heing developed. Former owners shipped sorted ore from the mine which averaged 17% copper, realizing in all ahout $20,000. Present work includes a 50-foot crosscut in ore from a 60-foot shaft sunk on the vein. From the same shaft is a 100-foot drift along the course of the vein. At another point a new two-compartment shaft is heing sunk, designed to go to water level, which is estimated to be hetween 200 and 300 feet from surface. The surface ores were copper oxides and carhonates, hut with depth have hecome chalcopyrite. The intention of the company is to erect a concentrating plant for this ore.

The south extension of helt is controlled by R. Fleming and E. B. Knox, who are doing some development work, the showing heing similar to that above noted. The north extension is owned hy C. S. Fleming and others. E. S. Dodge and G. Bronson also have locations on the same helt, 4 miles south of the canyon.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

KETCHIKAN.

Stevens, Fenton & Blanchard have a skid-sled road from their mine at Khyam, on Prince of Wales Island, to the head of the east branch of Skowl Arm. The skid-road consists merely of an ordinary corduroy road in the center of which there is a rail which serves to keep the sleds on the so-called track, the incline being such that no traction power is needed, except in hauling the empty sleds back up the mountain to the mine. In the moist climate the logs of which the road is constructed, having been peeled of their bark, have a smooth, slippery surface, upon which the sleds glide as if on snow or ice. The sleds carry down one ton each. The developments at the mine at present consist of a crosscut tunnel which shows an ore body 18 feet in width, and a drift on the trend of the vein 25 feet, the latter all the way in ore which carries from 18 to 22% copper, $6 gold and $4 silver to the ton, and some nickel. They expect returns of over $50 per ton from the 100 or more tons they have ready for shipment.

The Valparaiso mine at Dolomi, Prince of Wales Island, has shipped fifty-six tons of gold quartz ore, the value of which is estimated at $12,000. A previous shipment of thirty toos from this mine gave returns of $185 per ton.

The development work on the Puyallup mine, near Hollis, on Prince of Wales Island, is being continued and some very rich ore is being trammed down to the beach for shipment. R. Allison, manager, has ordered the machinery for a 5-stamp mill, complete, to be operated by water power. It is expected to have it set up and ready for operation by May 15.

ARIZONA.

COCHISE COUNTY.

The Tombstone Con. Mines Co. is putting in an electric light plant to furnish lights at the hoist, engine room, machine shop and throughout the mine. This is intended partly as a precautionary measure against possible fires, the timbering being dry. A telephone system will extend throughout the underground workings of the mines and will connect with the company offices in Tombstone.

GILA COUNTY.

(Special Correspondence). — The Pinal Copper Co., composed chiefly of St. Louis, Mo., men, are opening the old Black Copper mine, 8 miles west of Globe. The ledge ranges from 25 feet wide, is at a contact of rhyolite and schist, carries copper oxides and chrysocolla and is supposed to be on the same belt as that of the Black Warrior. Supt. L. C. Mott states that the ores run from 16% to 20% copper and that they are well suited to leaching. Former owners worked the mine through an incline shaft 340 feet deep. This company has sunk a vertical shaft 250 feet deep, from which crosscuts and drifts have been run on the 100 and 200 levels. A gasoline hoist is in use.

W. M. Williams of Globe is developing a property 16 miles from San Carlos which makes a good showing of iron and copper sulphide ores, carrying good values.

The United Globe Co. use a furnace blower at their Gray shaft to supply air to the different levels, conveying it down the shaft through a 10-inch pipe and from the latter through 8-inch pipes to the levels.

Paul Michaelson, an employe of the Old Dominion mine, at Globe, has devised a swinging frame for a cut-off saw, of use in framing mine timbers. The frame that holds the timber to be sawed swings on a pivot under the saw and is gauged by a graduated scale, which enables the sawyer to cut an exact bevel at any required angle. He has also devised gate bars at the collar of the shaft which are considered an improvement in protection devices against accidents.

Globe, Jan. 15.

S. Alexander, who owns the Alexander property, consisting of two claims near Globe, says he has struck a body of ore 18 inches wide which assays 71% lead and 100 ounces to the ton.

GRAHAM COUNTY.

The Shannon Copper Co. has decided to commence the erection of a 500-ton concentrating plant at Clifton as soon as the plans can be drawn by W. Carkeek, of Butte, Mont., who is engaged in their preparation. It is estimated that the concentrators and converters already installed will save the company from $3 to $5 per ton on every ton of ore treated, and that at least $300,000 saving will result by erecting the new plant at once, over and above what could be made during the time which would necessarily elapse before it could be paid out of the net earnings of the smelter alone. Upon the completion of the new plant the company will be able to treat at least 700 tons of ore per day. The amount required to complete these new improvements to the plant will be $600,000.

MARICOPA COUNTY.

The Lime Creek Copper Co. is erecting a thirty-ton smelter at Alhambra and expect to start it up in February.

Work on the Independence group, near Morristown, has been started by B. Swenginger. About 600 feet of work has already been done on these claims. The ledge varies from 6 inches to 3 feet and is a free gold proposition.

MOHAVE COUNTY.

Ewing & Heimrod of Kingman, who have bought the Ruby group of gold claims on the Big Sandy from W. H. Chapman, are starting work on the mines. A run of fifty tons of ore will be made, to test methods of extraction. A survey is to be made for a water power from the Sandy canyon. Ewing & Heimrod contemplate the erection of a milling plant, with concentrators and cyanide outfit.

PIMA COUNTY.

A. J. Shotwell, president of the Rescue Copper Co., located at Ajo, states that his company will open their copper mine and employ a large force of men.

SANTA CRUZ COUNTY.

The sale of the World's Fair mine in the Harshaw district near Patagonia, and owned by F. Powers, is reported for $500,000.

YAVAPAI COUNTY.

F. M. Williams has sold the F. Lee and J. Wheeler mines, near Bigbug, for $7000, to George & Co., of Los Angeles, Cal. About $2000 worth of development work has been done on the two mines, principally upon the Fitzhugh Lee, upon which there is a shaft 70 feet deep on a vein of ore 10 feet wide which carries about $18 per ton gold and silver, principally gold.

YUMA COUNTY.

The Planet copper mines, situated on Bill Williams Fork, 150 miles northeast of Yuma, are to be operated by Eastern people. Supt. J. A. Carrow has taken in a steam hoist to sink a two-compartment shaft to 500 feet. The Planet mine, it is said, was one of the first copper mines operated in Arizona, having been producing back in the '60s.

CALIFORNIA.

ALPINE COUNTY.

The Morning Star Syndicate propose to tunnel on the Morning Star group, near Loope, to intersect the copper lode at a depth of 500 feet below the deepest present workings in the mine.

BUTTE COUNTY.

At Oroville the machinery is being placed on three new dredgers, two on the west side of the river and one on the Oroville side. The west side dredgers are situated in South Thermalito and are owned, one by the Oroville G. D. & Ex. Co., the other by the Boston & Oroville Co. That on this side is the Wilcox-Leggett dredger. Another new machine is soon to be started by the Wilcox-Leggett Co. Work has been begun on the new machine shop near the Continental dredger, which is undergoing extensive repairs.

CALAVERAS COUNTY.

At the Beatrice mines, near Murphys, operations have been commenced after a shut down of some weeks.

Work has been resumed at the Yellow Aster mine, at West Point, owned by G. Congdon. He is extracting high-grade ore.

The Texas mine, at West Point, worked by Sheridan & Rumperi, is showing in development some very rich ore.

At the Paragon mine, at West Point, for a long time idle, preparations are being made to resume operations.

At Sandy Gulch a mine is owned by F. Walker of Pine Grove, who is extracting ore and grading a site for an arrastra.

Fifteen tons of ore from the Continental mine at West Point were recently worked in the Paragon mill with such good results that the operators propose to erect a stamp mill near the mine. A few men are employed extracting ore.

At the Gallna mine, near West Point, under bond to J. W. Shute and P. Porovich, a ledge of good ore has been discovered 2 feet wide.

EL DORADO COUNTY.

Development work is being made with two shifts on the 1000-foot level at the Josephine mine at Volcanoville, owned by the San Francisco M. Co. The tunnel is in 553 feet and for the last hundred feet is alongside the ledge, which shows 8 feet wide. Supt. J. M. Nougues, Jr., is preparing to pipe the mine water from this tunnel and from the No. 4 tunnel to obtain a 500-foot head for power to drive a Durkee electric drill. It is also contemplated to drive a crosscut at 625 feet in the tunnel to a point 165 feet west to intersect the footwall ledge.

Work has been resumed at the Boulder mine, near Placerville, four men being employed in running a tunnel to tap the ledge.

The Gignac gravel mine at Texas Hill has started up for the winter's run. Two hundred inches of water is being used under 250-foot pressure.

At the Craddock mine, Placerville, W. Craddock and G. Swansborough are working the vein averaging from 1 to 6 inches wide but exceedingly rich and continuous.

The Giebenhain Bros. are opening up their mine near Placerville. They propose to put up a mill at the mine in a few months. A three-ton test of the ore yielded $37.15. None of the ore or porphyry tested, it is claimed, has gone less than $12 per ton.

Development work at the Levitt mine, on the Mother Lode, near Kelsey, is being done by F. Levitt of Los Angeles. The mine is on a well defined ledge of free-milling ore, and the owners contemplate putting additional machinery on for further development work.

P. Stingle has returned from Boston, Mass., and it is said comes prepared to commence development work immediately on the old Chaparral mine, now known as the Golden Queen, at Kelsey.

MARIPOSA COUNTY.

In 1900 the Whiterock copper mine was discovered near Lewis P. O. The principal owner is C. C. Burrill of Ellingworth, Maine. E. L. Foster, late of the Hite mine, is Supt. The shaft is now over 150 feet in depth and has disclosed a large body of carbonate ore that it is claimed assays about 50% copper.

The copper mines, near Lewis P. O., owned by O. R. Sydney of Green Mountain, are working. The Lone Tree mine below the Star group is being worked and some copper oxide ore is being taken out. At Green Mountain Mr. Sydney is sinking a shaft to connect with a 600-foot tunnel.

MONO COUNTY.

J. B. Kennedy is milling fifty tons of ore taken from his lease in the Snowflake mine at Bodie at the Syndicate mill.

NEVADA COUNTY.

High-grade ore has been struck on the 400-foot level at the Texas mine at Grass Valley. The Texas mine has had expended on it over $150,000 in the way of machinery and development work.

New hoisting and pumping machinery and suitable buildings will be put on the La Suerte mine, near Grass Valley, to replace the old plant destroyed by fire in November last. Supt. Kirkham will have the shaft retimbered as soon as the machinery is in place. Sinking and drifting will then be resumed.

J. O'Connor, Supt. of the Conlin mine on Osborn Hill, near Nevada City, is planning to install considerable machinery, including air compressors, at the mine. All the drilling is now done by hand.

Operations are to be started at once on a mine situated on Selby Flat and owned by W. J. Britland of Nevada City. S. Blight of Grass Valley has been appointed Supt.

PLUMAS COUNTY.

J. J. Sullivan, representing the company which owns the Blue Bell copper mine at Genesee, shipped 18 tons of ore to the smelting works which yielded $84 per ton. An oil-burning smelter is to be placed on the mine for the reduction of the ores.

The Plumas C. & S. Co. at Genesee have several men, under the superintendence of C. L. Adams, sinking a shaft on a 4-foot vein. Most of the owners reside in either Minneapolis or St. Paul, Minn.

E. N. Mitchell and G. W. Brunk are developing a gravel channel near Genesee.

J. C. Borden & Son are developing the Pilot mine at Genesee which contains several ledges, the ore deposit being from 6 to 9 feet wide.

G. F. Brown reports a vein 6 to 8 feet wide in the Green ledge at Genesee. The ore contains gold, copper and silver.

On Mt. Jura, near Taylorsville, C. D. Biglow has made development of copper ore in a vein reported to be 5 feet wide. He is sinking a shaft.

SAN DIEGO COUNTY.

At the American Girl mine, in the Cargo Muchacho district, near Yuma, they are now running three sets of rolls and have lately installed eight concentrators It is stated that below the 350-foot level the ore has changed to the sulphides. The principal vein has a width of from 30 to 50 feet. They are now sinking to the 600-foot level. The ore runs from $6 to $8 in gold per ton. The company has a 12-mile pipe line from the Colorado river to the mine.

SHASTA COUNTY.

On the Oro Fino mine, near Shasta, the drifts are running on the ledge through nearly solid sulphurets that assay very high. C. H. Behrens, Supt, states that they will soon make a shipment of ore to the smelter.

SIERRA COUNTY.

J. Bothwell and associates have discovered a quartz ledge carrying high-grade ore on the bank of Jim Crow canyon, near Downieville, by sluicing off the surface.

J. G. Wolf, formerly at the Gold Bluff mine at Downieville, has bought the interest of F. R. Wehe in the Sailor Boy mine, formerly the Liberator, at Deadwood.

C. B. Wingate of Oakland, representing the English owners of the Thistle Shaft gravel mine, at La Porte, has the drain and working tunnel now in about 1500 feet and is making about 70 feet a week. The tunnel, when completed, will be 5000 feet long.

SISKIYOU COUNTY.

A large number of asbestos claims have been located in the Siskiyou mountains at the head of a branch of Sciad creek, north of Sciad P. O.

The Hidden Treasure mine, owned by J. Russell, located on Boulder creek, near Etna, has been bonded to H. L. McAllister of Etna, who proposes to commence work in a shaft on the ledge. The ore, it is said, requires to be smelted to obtain the values.

TRINITY COUNTY.

(Special Correspondence): At the Brown Bear Supt. Dobler keeps the 10-stamp mill running to its full capacity from upper and lower works. The usual winter force of 50 men is employed.

Deadwood Jan. 18.

The Hay Fork gravel mines are reported to be showing excellent prospects. The company has sunk 12 feet through good pay gravel and has not yet encountered bedrock. In the early spring work on the 21-mile ditch will be commenced. The ditch will take water out of Hay Fork creek.

The water of East and West Weaver creeks has been turned into the Sweepstake ditch and pipe line and through them into the reservoir on Oregon mountain. To the upper giant is a fall of 300 feet. Water has been run in the mines and in four hours 4000 cubic yards of gravel was worked.

TUOLUMNE COUNTY.

At the Olsen copper mine, near La Grange, the Santa Cruz Co. is working five men. Six carloads of copper ore have been shipped. Among the improvements soon to be made at this property is the putting in of a steam hoist.

A. Brown of Milton, representing San Francisco people, has been negotiating with claimants for the bed of the Tuolumne river with a view to mining it with dredgers.

Over 200 men are at present employed at the Shawmut mine at Jacksonville installing the machinery and working on the mill, which when completed will have 200 stamps.

The Jumper and App mines at Quartz are running with full crews, 75 men being employed at the latter with 40 stamps going in the mill.

At the Harvard mine at Jamestown the hoist house at No. 1 shaft is completed and covered awaiting the machinery. In this shaft they are raising from No. 7 to No. 5 level. Three skips, each 2 tons capacity, will be placed in No. 1 when hoisting is resumed, in place of the cages heretofore used.

The Mohican mine is on the Tuolumne river a few miles southeast of Carters. F. Chappellet, Jr., is manager. The company has received returns from its second run of three weeks and four days, amounting to nearly $6000. The rock worked has averaged over $20 to the ton. The 5-stamp mill is driven by a gasoline engine. The principal stockholders, residents of Oakland, are H. C. Chesebrough, G. H. Collins, G. W. Fisher, F. A. Leach, J. W. Classen and A. Higgins.

The Star M. Co., operating near Sonora, under Supt. Olsen, is preparing for the immediate resumption of work.

YUBA COUNTY.

It is reported that arrangements have been completed with J. O'Brien for land required for retaining hydraulic debris on the Yuba river at the figure originally offered by the Debris Commission. The suits to condemn the property will now be dismissed.

COLORADO.

BOULDER COUNTY.

The Montezuma tunnel, at Wall Street, now in 400 feet, is making regular shipments of ore, said to be going from thirty to fifty ounces in gold per ton. The vein runs 2 to 3 feet.

The Trojan mine, at Wall Street, is said to be producing more and better ore than ever before. The mine is owned by Meyer Bros. Two leads are being worked through the shaft down 250 feet.

The Smoky Hill lode, at Wall Street,

owned by the Ermanie G. M. Co. of Allentown, Pa., has a new shafthouse and plant. Steam drills have been substituted for hand labor. The shaft is now down 200 feet. G. E. Lake is manager.

CLEAR CREEK COUNTY.

Work has now been commenced on the Mint property on McClellan mountain, near Georgetown. A contract to drive the crosscut tunnel has been let for 1400 feet and three shifts of men are at work. W. H. Ross is manager.

G. L. Torrey of Colorado Springs has been arranging for operations at the King Edward's mine, at Idaho Springs, by installing a plant of machinery to push the tunnel ahead to a group of lodes in forty-three claims owned by his company.

The Detroit M. & R. Co. of Idaho Springs has been incorporated, capital $75,000, by W. P. Gillingham, T. B. Crow and C. H. Gillingham.

W. W. Kirby of Colorado Springs says of operations at the Lucania tunnel, near Idado Springs, that it is being driven by hand at the present time and making 2 feet per day. A compressor and machine drill will he added. The Kinda, Specie Payment and Champion veins will be cut and opened at a depth of from 1000 to 2700 feet below the outcrops.

EAGLE COUNTY.

J. Sands of Leadville is opening up the old Bleak House mine, at Red Cliff, with J. W. Stonebreaker as Supt.

EL PASO COUNTY.

The annual cleanup at the Economic mill at Colorado City is under way. The overhauling ordinarily results in the recovery of several tons of powdered quartz and containing from $10,000 to $20,000, which is shipped to a smelter for reduction. It has been recently demonstrated that this mill, which has been treating only Cripple Creek ores of low grade, is capable of treating mineral of any quality. A car of high grade was delivered to the mill hy mistake and it was decided to run it through as an experiment. The ore was subjected to the usual nine-hour treatment in the barrels, after which the barrels were recharged and the material run through again. The result was most satisfactory, as much gold being obtained as is usually secured by the smelters. But the second run, which seemed necessary, made the operation rather expensive.

GILPIN COUNTY.

B. Campbell, of the Cashier G. M. & R. Co. at Central City, says returns from a lot of Pittshurg ore gave values of twenty-eight ounces gold and 14% copper per ton. The second-class ore brought from $80 to $100 per ton. The ore came from the shaft heing sunk, and will more than exceed the cost of sinking it. Manager McCann reports for the month of December, 1901, the output of ore from the Kansas-Burroughs mines at Central City was 2482 tons. The shaft is now over 1400 feet in depth. Steam pumps are being used for freeing the mine of water.

C. W. Baldwin and associates of Chicago, Ill., have bought the Boer tunnel, at Black Hawk, consisting of a tunnel site and ten claims, and the work of development has been commenced, Mr. Baldwin being in charge. The tunnel has been driven 600 feet into the Dory hill and has opened several veins of good ore.

Omaha, Neh., people are starting up the Foot & Simmons mine, at Central City, under the management of H. Higginbotham, with R. Morris underground Supt. The property has been idle for eight years, and the shaft is being retimbered. The operators figure on installing a gasoline hoisting plant of sufficient capacity to reach a depth of 1000 feet.

GUNNISON COUNTY.

The Dubois Tunnel M. & D. Co., near Gunnison, has its tunnel in over 1200 feet and has cut four large veins. The first is 14 feet wide and, it is claimed, averages $7.20 in gold; the second, 3 feet, with the same value; the third and fourth are larger and average higher. The company proposes to put in a large concentrating mill this summer.

The Forest Hill Con. M. Co. owns about 300 acres of patented mineral ground at Tin Cup. The principal development is the Springfield shaft, over 400 feet in depth. From this shaft six levels run off into ore, which averages hetween $15 and $20 a ton. The company has recently completed a thirty-ton concentrating plant. The Springfield shaft ore is concentrated seven to ten tons into one, making three shipping products. The first runs $75 in lead, the second $60 in iron and lead and the third 40% to 50% in zinc. The Tourist shaft ore concentrates ten to twenty tons into one and produces a concentrate valued at from $50 to $150 per ton.

Three shifts are worked on the North Star tunnel at Whitepine. It is to go into the mountains 3800 feet and open the May-Mazeppa vein of lead ore at 400 feet depth. The Akron, Ohio, M. & M. Co. is doing this work.

HINSDALE COUNTY.

The new compressor lnstalled hy the Auric M. Co. on the Ute and Ulay mines at Lake City has been started up. The new compressor weighs 100 tons. It is guaranteed to run twenty 3½-inch drills. The new tunnel is in 2700 feet and is still being driven ln ore. A second upraise will soon he started from the lower tunnel to connect with No. 4 tunnel, a distance of 285 feet.

LAKE COUNTY.

Operations on the Bug Gold mine at Leadville will be resumed, according to Manager W. P. Dewey, who states that the work done late in 1901 shows a large hody of good milling ore, with the principal value in gold. New York people have become interested and arrangements are to be made to open up on a large scale. It is likely that a mill will he built.

At the Hap Hazard mine in Lake Park the new plant of machinery is in place. The main vein has been developed in a winze. The vein ls oxidized near the surface, but changes to a sulphide as depth is gained. An important feature of the mine is the immense quantitles of low-grade ore that can be quarried out at the surface. This will carry $4 to $5 a ton free gold, which can be recovered by cyaniding. It is expected that the new company will put a mill in early in the summer months.

The Big Evans M. Co., at Leadville, has started a new shaft which is now down more than 100 feet. The territory has never been explored, hut the outcroppings of the contact can be traced on the northern portion of the company's ground.

The Canterbury M. Co. of Leadville is negotiating for a larger plant of machinery. Arrangements are heing made to put in an electric plant with a new boiler and other necessary machlnery. While figuring on a plant of new machinery, the company will look into the matter of securing electric power for its hoister as well as drills.

It is reported that the A. Y. & Minnie and the R. A. M. mines at Leadville are to close down. The A. Y. & Minnie last year produced 19,000 tons of sulphides and 924 tons of zinc. The Small Hopes combination, of which the R. A. M. is a part, produced 32,280 tons of sulphides, 2402 tons of oxidized iron, 1727 tons of carhonates and 1074 tons of zinc.

LARIMER COUNTY.

The Empire mine at Bettls, 8 miles west of Fort Collins, has developed into a regular shipper. It is owned by New York and Denver people, Mr. Stark of the latter city being managing director. Since November the mine has shlpped over 800 tons of copper ore to the smelters. Additlonal men and machinery are being put in.

SAN JUAN COUNTY.

E. W. Walter, Supt. of the Kendrick & Gelder Smelting Co. at Silverton, is getting blds and estimates for machinery for the construction of a 400-ton reduction works or concentrating mill, lncluding an aerial tramway, for the Oliver Reduction Co. at Silverton.

Reports from the Kankakee mine, 18 miles east of Silverton, at the source of the Rio Grande river, 11,000 feet ahove sea level, predict a new mining district there. The tunnel is in 300 feet. In the discovery working, a 12 inch streak of telluride ore, the returns from the smelter were $100 gold to the ton. Mill runs, it is stated, gave an average for the entire surface ore body of 3.80 ounces gold and 4.07 ounces silver. The property is owned by a company of Denver people, of whom J. Frank is the president.

SAN MIGUEL COUNTY.

The new mill of the Telluride Reduction Co. will begin operations about Feb. 1. The portion of the mill which is to he started is the experimental plant, which will he in charge of Head Assayer Faber. Experiments to test the bromination process for the reduction of ore will be conducted. The mill, as it is now constructed, will handle fifty tons of ore daily, and it is the present intention to enlarge the capacity to 500 tons daily by June.

TELLER COUNTY.

Cinnahar specimens are being taken out of the E. Porter Gold King mine on Gold hill, Cripple Creek. No commercial amount of it has been found.

Work has been started on the 2000-foot shaft on the Plymouth Rock claim at Cripple Creek, owned hy W. S. Stratton.

Ore containing free visible gold ls being taken from the Ellen McGregor mine of the Fair Chance M. Co., at Cripple Creek, rlght on the surface. The mine was operated and a shaft sunk 300 feet in the early days, though no ore was ever taken from lt. The discovery was made in work done for the company; J. Kelley is Supt.

IDAHO.

BLAINE COUNTY.

The Torbanehill M. Co. has been incorporated in Salt Lake City, Utah, to develop the Torbanehill group of seven claims situated in an unorganized mining district in Blaine county. L. G. Young is president and D. Smellie secretary and treasurer.

BOISE COUNTY.

Stevens Bros. have bonded their Klondike gold quartz claim to H. Pope of St. Louis, Mo., who will develop it. An air connection has been made hetween the tunnels, and the lower tunnel is being pushed ahead.

IDAHO COUNTY.

Operations by the Boston & Seven Devils Co. at their Decorah mine near Landore are confined to the 335-foot tunnel, which is being retimbered throughout. The buildings near the mouth of the tunnel are being rebuilt. The work is in charge of Superintendent T. G. Jones.

The Thunder Mountain M. & M. Co. has been incorporated in Spokane, Wash., to operate a property in the Thunder Mountain district. The capital is $50,000, and the trustees are J. W. Shearer, J. H. Conklin, J. B. Johnson, J. F. Pasold, E. A. Patrick, L. L. Jones and F. W. Girand. J. F. Pasold says the property is 55 miles southwest of Warren and is located on a vein 30 feet wide between well defined porphyry walls with outcroppings exposed for 1200 feet. Average samples, he says, assay from $4.13 to $28 a ton. It is the intention of the company to commence work on the mine in the spring and to erect a 10-stamp mill.

The Midas mine at Dixie has shipped $3000 in gold bullion. The mine is a medium grade free milling proposition and has a large ore body, with a considerable tonnage already exposed. It is owned by Finch & Campbell of Spokane, Wash.

Reports from the Thunder Mountain gold district show that development work is being continued in spite of the deep snow and confirm the first reports of richness and extent of the fields. It is stated that it is almost impossible to pack in provlsions over the trails in winter. At Mackay, Boise, Salmon City, Ketcham and Weiser hundreds of prospectors are already gathering to start in as soon as the trails are passable. A stage line from Ketcham, to he started about May 1st, has been arranged for.

The Crooked Rlver M. & M. Co. is doing development work on its group of quartz and placer claims at Elk City. A 10-stamp mill is at Stites to be frelghted in and installed. The quartz has been developed and is said to show large hodies of milling ore.

R. W. Purdum of Nampa has concluded the sale of the Hidden Treasure and Rainbow groups of claims at Thunder Mountain to a Pittsburg, Pa., company, which has put twenty-five men at work on the Hidden Treasure group of three claims, and another force on the Rainbow group. A 3500-foot tunnel will be driven on the claims. Assays of the ore give values from $6 to $9 a ton. If a good showing is made a 100-stamp mill will be put on the mines. The main office of the new company, of which Mr. Purdum is manager, will he located at Nampa.

KOOTENAI COUNTY.

Manager Ferguson of the Rebate mine, near Hope, in the Pend d'Oreille country, reports a rich strike of gray copper and hlack sulphurets, assaying over 700 ounces in silver to the ton.

OWYHEE COUNTY.

The mill on Twilight Gulch, near Flint, built by White Bros. and D. Adams, has been started up. The mill is a 5 stamp battery from which the pulp runs over two Frue vanners, one behind the other, and thence over tables, the values heing saved in concentrates. It is expected to reduce ten tons of ore to one, in which shape it will he shipped to smelters. The owners estimate that the concentrates will he worth about $1000 per ton.

The owners of the Addie mine have hought the Calaveras, Omega and Josephine claims at Silver City from J. S. Meyer, and have incorporated the property as the Addie Con. M. & M. Co. The company is prepared to erect a mill and do extensive work.

SHOSHONE COUNTY.

The Hecla mine has resumed operations. Since it was closed down, almost a year ago, a large force of men has been employed ln development work, but this week about twenty more were put on and mining was resumed. The mill at Gem will not he started. The ore will be concentrated in the Standard mill.

MONTANA.

FERGUS COUNTY.

On the Oro Grand claim at North Moccasln, owned by W. Smith, exploration work has developed lt to he a continuation of the ore deposits on the cyanide belt of the North Moccasin.

A new sapphire field has been discovered in the northeastern part of this county in Blood creek. Blood creek is a small stream located in a wild and hroken country. All that locality is a series of had lands, and, being an arid, barren region, it is almost totally devoid of settlement. According to C. Deo of Lewiston, the discoverer, the gem-bearing district covers an area of 15 miles long and 4 miles wide. The stones hrought out have been pronounced sapphires of an excellent quality, similar to the white sapphires found in the Yogo district.

FLATHEAD COUNTY.

(Special Correspondence).—The Butte Co., which is drilling for oil in the Flathead county oil fields, has its well now down ahout 300 feet.

The Rustler M. Co., with D. P. Bowers as manager and a force of thirty-five men, have hegun operations at the Snow Shoe mine, near Lihby. The shaft will be sunk 500 feet deeper. The concentrator is being repaired, and, when in shape, a full force of about 200 men will probably be employed. The Snow Shoe has been closed down during the past year.

A new tunnel is being run on the Silver Cable property, two shifts being worked. It is planned to start up the mill in the spring.

The hydraulic plant for the Vaughan & Greenwell placer mine, on Libby creek, has been ordered preparatory to operating in the spring.

J. L. Scarlett of Lihby has had some tests made on ore taken from his Cedar group which show as high as $160 gold per ton. The ledge, it is claimed, has widened out from 2 to 5 feet.

The Mustang M. Co. of Spokane, Wash., has begun operations in the West Fisher mining district.

The American Kootenai M. & M. Co. have ordered an electric light and power plant and air compressor.

The Brick & Brannegan mine and mill are working full capacity. The ton value of the ore, it is reported, has increased considerably with the greater depth of working.

The plans for the new Mother Lode mill are being made in Helena. The mine is considered to show enough ore in sight to keep the proposed mill running for two years. The large ledge, which runs from 6 to 12 feet in width, is a free-milling gold-bearing quartz.

Libby, Jan. 15.

LEWIS AND CLARKE COUNTY.

A large hody of hlgh-grade ore averaging, it is said, upwards of $30 per ton in gold, silver and copper, with 10% lead, has been discovered in the Empire mine, near Marysville. The ore body is from 6 to 10 feet ln width and has been opened for over 110 feet in length. The gold in the ore is partly free and can be saved hy amalgamation; the remainder, and the copper and lead, by concentratlon. The Empire is under bond to the Superior & Montana Dev. Co., of Houghton, Mich.

NEVADA.

DOUGLAS COUNTY.

In the tunnel heing run by W. Virgin near Genoa, the rock encountered ls so hard that but 6 inches a day is made. It costs from $15 to $20 per foot to run lt.

HUMBOLDT COUNTY.

Supt. Miller is having some development work done on the group of claims near Golconda owned hy the Enterprise M. Co. Five men are employed.

LYON COUNTY.

A gold prospect has been discovered hy I. W. Johnson, near Cambridge, from whlch assays of over $300 per ton were obtained.

The report that the Nevada Reduction Works at Dayton would receive no more ore from Tonopah, as it was not worked up to the required standard, is not a fact. At the mill in Dayton the ore is steadily coming ln and the mill is working double shifts to handle it. Mr. Davis, manager of the mill, states that the mill is working the Tonopah ore to the required standard and that no complaint is being made hy the parties that ship the ore.

The Roger's cyanide plant at the Douglass reservoir is heing pushed to completion and is expected to he running by the 15th of February.

At the Bluestone group near Cambridge, owned by the Excelsior Copper Co., no work is being done above the 200-foot level. On this level a drift has been run about 330 feet from the bottom of the winze, and the last 45 feet is in chalcopyrite ore averaging, it is claimed, not less than 10% copper.

At the Ludwig mlne, near Cambridge, ore carrying 12% copper is heing taken from the 100-foot level and worked ln the company's smelter. On the 200-foot level it is claimed the ledge ls 20 feet wide of oxide ore which averages 17% copper. The ore contains sufficient iron for a flux and there is also in the mine a large

ledge of calcspar carrying 45% lime and 4% copper.

NYE COUNTY.

The Tonopah M. Co. is taking up the work on the mines at Tonopah where the leasers left off and will sink a number of shafts. A new working shaft has been started about 200 feet north of the Mizpah ledge in the hanging wall. It is the plan to erect over this main shaft a new steel hoist with a 150 H. P. double reel cross compound hoisting engine and a large compound air compressor. The small gasoline hoist at present at shaft on the Mizpah ledge will be used for a prospecting shaft, which will he sunk quickly as possible to prospect several veins to a depth of about 600 feet. The shaft on the Cutting lease will also be sunk, as that will cut the rich ore shoots towards the center of the Mizpah ledge. It is contemplated to start a deep working shaft on the Valley View claim in the near future.

ORMSBY COUNTY.

A 5-stamp mill is to he erected in Carson for custom work and sampling.

WASHOE COUNTY.

It is claimed that there are at least twelve mines in Olinghouse district, which are sufficiently developed to keep the mills there running constantly on low-grade ore.

R. R. Arnold, general manager of the Colorado-Nevada M. Co. of Cripple Creek, Colo., states that before March a large steam hoist will be erected over the company's shaft at Wedekind.

WHITE PINE COUNTY.

The Olympic group of mining claims at Cherry Creek has been bonded to C. E. Hayden of Colorado Springs, Colo., at $20,000.

NEW MEXICO.

GRANT COUNTY.

J. L. Schofield and C. Derbyshire have leased from the Pinos Altos G. M. & M. Co. the tailings of the old Bell & Stephens mill at Pinos Altos. They have started treating the ore by concentration and amalgamation.

Work on the Gettyshurg group of twenty-one claims at Burros has developed a vein of ore 3 feet wide which runs 15% in copper and a few ounces in silver.

LINCOLN COUNTY.

A rich strike is reported near Nogal. From a mill run of 500 pounds of the ore the returns amounted to $1200.

SANTA FE COUNTY.

J. H. Cook, in charge of the electric power plant of the Cochiti G. M. Co. at Madrid, has made a continuous run of 1752 hours, closing down for a few hours. The engine of the plant is 800 H. P. The three-phase system of transmission is used, delivering from 400 to 600 H. P. at the Albemarle mine, 35 miles distant.

OREGON.

GRANT COUNTY.

W. C. Rutter, president and general manager of the Kittanning M. Co. of Seattle, Wash., has arranged for the development of the Big Four group of mines, near Granite, on an extensive scale, stating that hetween now and next July his company expects to spend a large sum in development work.

The Concord mine, near Granite, is reported to have heen sold to Godfrey & Tahor, the owners of the Red Boy, for $300,000. C. B. Wade of Pendleton is the principal owner of the Concord.

JACKSON COUNTY.

A quartz vein, the ore of which yields from 35 cents to 50 cents per pan in free gold, has heen uncovered in the Dry Diggings district, near Grant's Pass, hy Andrews Bros. The discovery was made by the continued sinking of a shaft heneath a pocket. Instead of ceasing work after the pocket was worked out, the shaft was continued down and struck a rich ochre seam which, on heing followed, developed into a 6-inch vein of soft crumbling stuff, with the free gold richly sprinkled through all parts of it.

W. Mayfield, the discoverer of the rich Mayfield cinnabar claim in the Meadow district, has made another rich strike. At a depth of 10 feet on the Hydrargyrum he has uncovered a ledge that has a width of several feet and carries 30% mercury.

JOSEPHINE COUNTY.

The Gold Bug mine, situated on Mt. Reuhen, near Glendale, is steadily operating with its 5-stamp mill. About 20 men are employed. The company has put in a cyanide plant to handle the stamp-mill tailings which carry assay values of about $15 per ton. A depth of 300 feet has heen reached in the shaft and the ore hody has increased in size and richness with the depth. A new hoist is soon to he added and other improvements in equipment will be made.

The Lucky Queen mine on Jump Off Joe, near Grant's Pass, is now being developed, with C. D. Crane as Supt.

G. Bolt, owner of the Sugar Pine mine at Gallce, is taking out ore in which free gold is visible. The mine is under bond to Dr. Ray of Grant's Pass and is being opened hy a 600-foot tunnel.

UTAH.

BEAVER COUNTY.

W. H. Penrose of Salt Lake City has made arrangements for erecting the new shaft house on the Estelle at Milford. He expects to have the new 25 H. P. hoist in operation hy the 15th of February. A well is to be sunk to provide a water supply for the mine.

The Copper Mountain M. Co., operating at Frisco, has been reorganized in Salt Lake City and B. T. Lloyd made secretary and treasurer. The company owns six claims, with a shaft 275 feet deep sunk on the ledge. The ore runs, it is claimed, from 9% to 15% copper, seven ounces silver and from $1.60 to $2 in gold per ton.

IRON COUNTY.

The new mill on the Ophir mine at Stateline has been closed down, it is stated, because of insufficient water supply, and to increase which a pipe line will be constructed at once. Work in the mine is being continued.

JUAB COUNTY.

The Tintoretto M. Co. has heen incorporated at Salt Lake City, capital $30,000. B. B. Mann is president and H. O. Jackson secretary and treasurer. The company owns the Valley View and Valley View Fraction claims near Tintic.

F. Morehouse, Supt. of the Martha Washington mine at Silver City, says that from 90 feet depth in the new double-compartment shaft he is crosscutting to the vein that will be tapped at a depth of 246 feet on its dip.

A. D. McLean, Supt. of the Trapper's Pride mine at Gold Mountain, owned by the Madsen G. M. & M. Co. of Salt Lake City, reports that from No. 1 tunnel over 20,000 tons have heen stoped for the mill, which will he erected during the summer, while No. 2 tunnel has been driven into the group a distance of 700 feet.

SALT LAKE COUNTY.

The New Hope M. Co. has been incorporated at Salt Lake City, capital $900. The officers are J. E. Frick president and A. Kee secretary and treasurer. The company has a lease on the Liheral claim at Bingham.

It is stated that the New England G. & C. M. Co., operating the Nast group at Bingham, has decided to sink another 100 feet to 200 feet below tunnel level. The working force at the mine has been increased.

SUMMIT COUNTY.

H. Bowdich, Supt. of the O'Donovan group, near Park City, for Jones & Walker, is sinking the shaft on the Spring claim of the group.

UTAH COUNTY.

Z. Lot, M. Mills and W. Davis, who have heen working on a prospect in the Wasatch range, near Provo, claim to have struck ore running high in gold.

WASHINGTON.

CHEHALIS COUNTY.

Some fine specimens of minerals are reported to have been discovered on the Clearwater river in the Olympic mountains. The specimens assay 20% copper, with traces of gold and silver. It is stated wages can he made in the placer digging. The country of the discovery is tributary to Hoquiam.

JEFFERSON COUNTY.

Gold-hearing hlack sand has been discovered near Fort Flagler which may be worked.

SPOKANE COUNTY.

D. L. Huntington, secretary and general manager of the Washington Water Power Co. of Spokane, has completed plans for increasing the capacity of its Spokane Falls power plant from 7500 to 15,000 H. P. The cost of the improvement is estimated at $500,000. The increase of the power plant is to furnish electrical power to the mines in the Cœur d'Alenes. Contracts have heen secured from the principal mine owners for at least 1500 H. P., to be used at once.

WYOMING.

CARBON COUNTY.

The cost of construction of the aerial tramway from the Ferris-Haggarty copper mine at Battle Lake to the smelter at Encampment, work on which will he commenced as soon as the material can he hrought in, will he ahout $300,000. Specifications are heing prepared and hids will be called for as soon as these are completed. It is reported that if this tramway is a success others will be put in connecting the smelter with the New Ramhler mine in Douglas Creek district, with Pearl, Colorado and other camps.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The granting of 200-foot claims at Atlin has greatly increased winter drifting. Ahout forty men are working on upper Pine creek—"tar flats"—in the north hank. Some sixty men are drifting successfully on the south bank of Spruce creek hetween discovery and 140 helow. Carmichael & Moran are continuing two successful tunnels on upper Otter creek. So far the ground averages $4 per cubic yard; size of drifts, 4½ feet width and 6½ feet high. Winter drifting is also heing pushed on Boulder creek, above the De Lamare hydraulic works, and into the bank from the hydraulic pit.

The hydraulic operations of the Minard Syndicate on McKee creek will he douhled in capacity. It is reported that a plant will he installed to work the henches controlled by Hawkins & Christopher. On Spruce creek the Columhia Hydraulic M. Co of Chicago is well installed to operate for a full season ahove discovery. The Blue Canyon property on upper Spruce creek has been taken over hy Lamhert, Jackson & Letherdale. A plant will be installed. S. O. Wheelock of Juneau will work the Gladstone lease an an individual property. The Gorgon lease will be worked hy Rohinson & Sageman.

The Consolidated Spruce Creek Placers will operate on a large scale on Spruce creek. The company will install a plant to cost $150,000 and bring water from Pine creek. W. M. Brooks is general manager, Mr. Blakemore Supt of construction. The company's head office is at Seattle, Wash.

Atlin, Jan. 9. J. B. H.

The Mines Exchange, Ltd., of Nelson reports that the Canadian Smelting Works will proceed at once with the construction of a refinery at Trail, of sufficient capacity to handle the present bullion output of British Columhia.

The Canadian Pacific R. S., which last summer bought the group of iron properties near Kitchener, has taken over another group of four claims at the same point, paying, it is reported, $25,000 cash.

The ore shoot recently struck on the Ottawa mine at Slocan has been drifted on 21 feet and two carloads of ore, carrying 1329 ounces of silver, 1½% copper and ½% lead to the ton, is being shipped to the smelter. The vein is 2½ feet wide of solid ore, the above being given as an average value of the entire vein.

The total exports of ore from ten properties in the dry ore belt in the Slocan during the past year were 6514 tons.

The following is the estimate of the output for 1901 for the southern portion of Yale and Kootenay:

District.	Tons.	Value.
Nelson	105,000	$ 850,000
Slocan Lake	14,000	1,250,000
Lardeau	3,232	450,000
Ainsworth	22,500	1,750,000
Trail Creek	293,201	3,811,000
Boundary	371,832	3,750,000
East Kootenay	25,000	852,200
Mines not reporting	....	350,000
Totals	805,765	$13,063,200

The tonnage of ore smelted at the British Columbia Copper Co.'s smelter at Greenwood since it started work last February was 117,565 tons. This quantity represents ten months' run of a single furnace of a nominal capacity of 250 tons, the last month's run heing a record one, totaling 13,098 tons, or 422 tons a day.

On the advice of Engineer Blakemore the Similkameen Valley Coal Co. recently purchased nine more quarter sections of coal land, on which they have coal that will coke, giving a return of 75% of fixed carbon.

A lease and bond has heen taken by G. W. Holmes of Nelson on the Queen group of gold claims adjoining the Yellowstone mine. The lease calls for 15% of the receipts from ore shipments and $50,000 for the mine. It is intended to use the Yellowstone mill for the reduction of the ores.

The bond on the Tamarac group, Slocan, has been lifted and the deeds turned over to the company. The price paid for the property was $18,000.

W. Harvey has bonded the molyhdenite claim owned hy W. Brasch of Nelson and located in the Slocan. The price stated is $2000 cash at the end of three months or $4500 at five months.

Nelson, Jan. 10.

Trade Treatises.

THE merits of the Truax automatic ore cars are finely shown in a hooklet just issued by the Globe Iron Works of Stockton, Cal, who have the Pacific coast sgency for their manufacture and sale. The hook tells ahout all any one wants to know on this subject, is handsomely illustrated and will he sent to any address on request.

Personal.

W. H. WILEY of Idaho Springs, Colo., is at Tucson, Ariz.

J. A. KIRBY succeeds J. Keetly as Supt. Little Bell mine, Park City, Utah.

E. W. WALTER will he general manager Oliver Reduction Co., Silverton, Colo.

C. L. HENRY has heen elected president Technical Society of the Pacific Coast.

W. R. SHILLING has been appointed Supt. American G. M. Co., Ogilhy, Cal.

DR. HAANEL is in charge of the new government assay office at Vancouver, B. C.

HARVEY HARDY is now Supt. Hecker mine, Summerville district, Emery county, Utah.

W. WATSON of Quincy, Cal., has gone to Magdalene, Sonora, Mexico, to remain two months.

CHARLES L. LANO has resigned as Supt. of the Mack Con. M. Co. at Big Oak Flat, Cal.

C. B. DERBY, Supt. of the Inyo Marble Co. at Marmol, Nev., is sojourning in San Francisco, Cal.

WILLIS MCCORNICK of Utah has gone to his Siherian mining property, where he will remain till 1903.

J. LUCE this week began operations at the Hardie Mt. Cinnibar syndicate, Hardie Mountain, B. C.

A. A. GRAY is Supt. of the Gray-Wing drift placer mine, near Mormon Island, Sacramento county, Cal.

H. C. ANCHOR of Boise City, Idaho, is in Owyhee county of that State examining several mining properties.

W. H. STORMS, Supt. Baliol mine, Amador Co., Cal., has returned there from a visit to San Francisco.

H. A. SHIPMAN, general manager of Stratton's Independence mine at Cripple Creek, Colo., is in New York.

W. R. MARDEN, M. E., of New York, has returned from Siheria and is in San Francisco, Cal., en route home.

H. C. BELLINGER, late smelter Supt. Montana Ore Purchasing Co., is succeeded by former Asst. Supt. Blossom.

G. DECKER of the Stillwell-Bierce & Smith-Vaile Co. of Dayton, O., has returned from a trip to Germany.

ROY D. HUNTER, Western manager Sullivan Machinery Co., has returned from Salt Lake City, Utah, to Denver, Colo.

G. T. COFFEY of London and G. Hothersall of Nevada City, Cal., are en route to the Klondike in the interest of London mining companies.

C. ROSE has heen appointed Supt. of the electric power plant of Cochiti G. M. Co. at Madrid, New Mexico, succeeding J. H. Cook, resigned.

J. W. NEILL, former manager of the United States Co. mine at Bingham, Utah, has returned to that place from several months sojourn in New York.

H. A. COHEN is at Bully Hill, Cal., arranging for the forwarding of the copper, gold and silver hearing hullion to Capt. De Lamar's new refinery in New Jersey.

JNO. M. BECKWITH, formerly manager Silver King, Calico, Cal., and subsequently of Goongarie, West Australia, is now general manager Las Minas, Becerrea, Lugu, Galicia, Spain.

D. S. RICHARDS has been appointed Supt. of the Liberal mine, near Hailey, Ida., succeeding C. W. Courtney, who has accepted engagement with a company developing Thunder mountain, Ida, mines.

Commercial Paragraphs.

JAMES LEFFEL & CO. of Springfield, Ohio, have an order for a 35-inch horizontal turhine to he shipped to the Caucasus.

THE American Steel & Wire Co. has created a pension department, which provides for the pensioning of old and faithful employes, in accordance with their terms of service. All employes of the American Steel & Wire Co., or its predecessors, are eligible The funds to provide pensions will he furnished hy the company. Between 25,000 and 30,000 men are employed by the company.

AN order hy the Santa Fe Railroad Co. calls for an engine that will haul a load of 2100 tons up a 50-foot grade. The rigid wheel hase is 20 feet and it weighs 137½ tons. On the drivers there is a weight of 230,000 pounds, or 115 tons. The type is the decapod, with ten drivers. To the top of the stack the height is 15 feet, and to the top of the hoiler 12 feet 7½ inches. The heaviest engine now doing mountain work for the Santa Fe has a weight of 163,000 pounds on the drivers, and a number of engines are heing huilt for the company which will have a weight of 191,000 pounds on the drivers.

Latest Market Reports.

SAN FRANOISCO, Jan. 23, 1902.

SILVER.—Per oz., Troy: London, 25 9/16d (standard ounce, 925 fine); New York, bar silver, 55½c (1000 fine); San Francisco, 55½c; Mexican dollars, 45½c San Francisco, 44½c New York.

COPPER.—New York: Lake, 1 to 3 casks, $11.25; carload lots, $11.00; Electrolytic, 1 to 3 casks, $11.00; carload lots, $10.87½; Casting, 1 to 3 casks, $11.00; carload lots, $10.75. San Francisco: $14.15. Mill copper plates, $17.15; bars, 24@18c. London: £48 per ton.

LEAD.—New York, $4.00; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £10 16s 3d per ton = 2.26 cents per lb.

SPELTER. — New York, $4.30; St. Louis, $3.90; London, £16 15s per ton; San Francisco, ton lots, 5c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, $16.00; gray forge, $15.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27.00; open hearth billets, $29.50; San Francisco, bar, 7c to 12c per lb.

TIN.—New York, pig, $23.50; San Francisco, ton lots, 26c; 1000 lbs., 26¼c; 500 lbs., 26½c; 200 lbs., 26½c; less, 27c; bar tin, per lb, 30c.

PLATINUM.—San Francisco, crude, $19 per oz.; New York, $20.50 per Troy oz

BISMUTH.—New York, per lb., Subnitrate, $1.50; San Francisco, $2.50 to $2.75 lots.

QUICKSILVER.—New York, $51.00 large lots; London, £8 17s 6d; San Francisco, local, $48.00 per flask of 76½ lbs.; Export, $45.00

MAGNESIUM.—New York, $2.90 per lb.; San Francisco, $3.75.

ZINC.—San Francisco, 5½c; slab, 5¾c; bar, 7c; zinc dust, N. Y., 6c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 17c; San Francisco, Plumbers', 100-lb. lots, 14.25c.

NICKEL.—New York, 50@60c per lb.

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $53.50, large lots.

TUNGSTEN.—New York, per lb., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 32c; San Francisco, 65c (60%).

ASSAY LITHARGE.—San Francisco, 10c per lb, small lots.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c per set; 14 oz., 40s., 9c.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CURTAIN HOLDER AND POLE RING.—No. 691,155. Jan. 14, 1902. Emil Marsky, San Jose, Cal. This device is designed for convenient attachment of curtains and draperies of any description to the rings and the rings to poles or rods upon which they may be slidable. Each holder consists of a strip of spring metal bent into a curvature to surround a rod or pole and having intersecting notches at the point where the two ends cross each other. These notches may be interlocked to form the ring, and the parts which extend beyond are then given a reverse curve, so that the ends will close together by the spring of the part encircling the pole. The meeting ends thus closed together may be serrated or otherwise formed so as to grasp and hold the curtain or drapery. To disengage them it is only necessary to slip the interlocking notches away from each other sidewise, and the entire rings can be enclosed and removed from the pole.

NOTICE TO ENGINEERS.

Send $1.00 for complete instructions how to erect and start up a compound condensing Corliss engine; how to set the valves on all sizes of engines; rule for finding M. E. P. without the indicator; changing engine speed; setting eccentrics, etc

W. H. LA PEARLE, Salt Lake City, Utah.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JANUARY 14, 1902.

691,229.—TELEPHONE—Andriano & Herhstritt, S. F.
691,244.—POURING METAL INTO MOLDS.—J. V. Coleman, S. F.
691,127.—PENCIL SHARPENER—A. T. Fox, Tacoma, Wash.
691,311.—LIFE PRESERVER—C. Gore, S. F.
691,146.—LEVEL AND PLUMB—J. V. Janin, Seattle, Wash.
691,270.—WATER BANDAGE—C. H. Jones, Tempe, Ariz.
691,061.—JACK SCREW—G. L. & S. W. M. Kollock, Seattle, Wash.
691,277.—POSTAGE STAMP CARRIER—J. H. Lasserot, Berkeley, Cal.
691,155.—CURTAIN HOLDER—E. Marsky, San Jose, Cal.
691,163.—PULVERIZER—W. F. McClellan, Seattle, Wash.
691,175.—CAR AXLE BOX—J. L. Petithomme, Oakland, Cal.
691,077.—BUTT HINGE—F. W. L. Schafer, Los Banos, Cal.
691,013.—MENUGRAPH—W. H. Smyth, Berkeley, Cal.
691,015.—HARNESS SADDLE—E. A. Spaulding, Phœnix, Ariz.

To Hydraulic Gold Miners.

Well prospected gravel mine in ATLIN DISTRICT, British Columbia, containing One Million to One Million and a Half, can be controlled and equipped for FIFTY THOUSAND DOLLARS. Full reports and maps. References exchanged.

J. H. BROWNLEE,
Civil Engineer and Surveyor,
319 BOURNE AVE., SEATTLE, WASH.

SITUATIONS WANTED.

WANTED.—Position ae Superintendent of a quartz mine. Have had years of experience. Can do anything about a mine or mill. Am holding position as mine superintendent at present. No objection to South Africa, Korea, or Mexico. References given. Address L. W., care of this office.

WANTED.—Position as Assayer and Milliman by a practical man Am a practical miner. Understands cyanide work and mine accounting. Competent to act as assistant superintendent. Can handle men. No objection to Mexico or British Columbia. Address XZ, care of this office.

WANTED.—SITUATION IN MEXICO OR South America by experienced cyanide operator who speaks Spanish, is skilled in assaying, surveying, sampling, examinations, etc., and is practical. Address L. J. B., this office.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.

Two Mechanical Draughtsmen Wanted for Northern Part of Mexico.

State experience and salary expected. Address C. C, care of Mining and Scientific Press.

WANTED.
A Free Milling Gold Proposition.

One with a well-defined vein, either a prospect or partially developed mine. State price, terms, location, and full description. Only owners dealt with; no brokers recognized. Address Box 3452, Boston, Mass.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from J. C. Murphy, in the Hidden Treasure Hydraulic Mine, at Kelsey, El Dorado Co., to deposit tailings in Kelsey Canon; from John Pascoe and W. H. Secombe, in the Chili Ravine Gravel Mine, near Placerville, El Dorado Co., to deposit tailings in Chili Ravine; from Warren T. Russell, in the Happy Flat Placer Mine, at Garden Valley, El Dorado Co., to deposit tailings in Happy Flat Creek; and from Wentz Bros., in their mine, near Pleasant Valley, El Dorado Co., to deposit tailings on a flat below the mine, gives notice that a meeting will be held at Room 59, Flood building, San Francisco, Cal., on February 3, 1902, at 1:30 P. M.

Quartz Mining in the Klondike.

With increasing frequency reports from Dawson, Yukon Territory, discuss the development of a commercial quartz mining industry in the placer gold region of the Klondike. The first quartz mill, it is declared, started crushing in Novemher last and a second one a few weeks since. The capacity of hoth, it is stated, is exceeded hy the quartz offered for crushing. The winter cold is not permitted to interfere with operation.

The hints as to the charges for crushing indicate an exceedingly high grade of ore heing mined. One mill is offering to crush quartz for half of the gold recovered. To pay Klondike mining costs and transportation costs from the mines to the mill from one-half only of the gold in the ore, and have anything left, implies very rich ore. This is an incident, however, of the beginning of development of an industry novel to the country. Once the miners are sure of their mines, mills will multiply and grow like the vegetation in the short summer of that northern land.

The development of quartz mining in the Klondike has more than a local significance. It is the beginning of an industry that will populate and make rich and prosperous not alone the British Yukon, hut much of the vast interior and Arctic coast country of Alaska. It has taken some years to convince people that the Klondike had a resource in quartz mines that would long outlive the exhaustion of the placer mines. Gold-hearing quartz veins were discovered early, hut the comparison with the adjacent much easier exploited placers put them at a commercial disadvantage. With placer mining now well estahlished, and with its end in many localities measurable as not many years distant, the quartz veins are now receiving the exploration which is, it seems, more than realizing anticipations.

The Klondike has no monopoly of quartz mines associated with placers. The other placer mining districts of the north land have their quartz vein system also. In many they are yet to be discovered. In others they are simply located prospects with no actual work of development. This is the heginning that the industry must pass through. First, it will be declared there can he no quartz mines since there are none. Next, opinion is positive that there can he no quartz mines since the veins found are only prospects. Finally, some one actually gets gold in paying quantities out of one or more of the prospects, and opinion yields to the accomplished. The gold quartz mining industry of the Klondike is like the first swallow, which, while it does not make spring, nevertheless indicates that it is coming.

Gold quartz mines in interior Alaska mean roads, railroads, towns and cities, commerce and manufacture, the opening of coal mines and the huilding of great water power plants—all of which it will support. The country is too distant and isolated for it to remain entirely dependent on Canada and the States. It will have to build much for itself and become measurahly self-supporting. Gold quartz mining will provide a permanent basis for this as nothing else will. Ultimately with the multiplication of these facilities that entrain after it, the cost conditions of quartz mining will become equalized downward till they hecome ahout the same as in lands now regarded as more favored.

It is with much interest that this journal records the advance of quartz mining in the far inland north. It firmly estahlishes the existence of a vast storehouse of wealth which can become the suhstantial hasis of investment for surplus capital, and furnish the industrial life-hlood not alone for itself, hut for the producing and manufacturing industries of this older country. It will make a new permanent field for its surplus population and surplus production. .

Pride of the West Mill and Smelter, Washington, Santa Cruz County, Arizona.—(See Page 64)

Liberal Mine, Near Hailey, Idaho.—(See Page 60.)

CHROME IRON ORE deposits in California are hecoming profitahly workahle in a small way to supply the demand for a new service. The mineral is highly infusihle and resistant to corrosion hy melted metals and furnace slags. Its new use is as the furnace hearth lining of copper matte smelters. The California chrome iron which carries hetween 40% and 50% of chrome acid is found to be well adapted to this service, for which ore containing as low as 40% of acid is availahle. Where deposits are located close to railroad lines the mining of the chrome iron affords a fair margin of profit. The husiness should increase, as the adaptability of the ore for this purpose has only lately hecome known and hut few smelters have hegun to make use of it yet. For the manufacture of ferro-chromium the California ore is considered too low in chromic acid percentage by the manufacturers in Pennsylvania who import for that purpose the Turkish ores which run over 50% in chromic acid. The same ohjection has been made to the use of the California mineral for the manufacture of chromium salts and pigments. Considerable had been done in the way of development and commercial production in California in former years, and there is some promise of permanence in the industry.

The Handling of Explosives.

Familiarity with high explosives develops a tendency to carelessness in their handling, which is the cause of many avoidable accidents. The manufacturers of dynamite are doing what they can toward producing an article that will be "fool proof" against reckless handling. They have not succeeded yet in accomplishing it. There is no real knowledge of the cause of many spontaneous explosions where every precaution that experience could suggest had been taken to protect against the possibility. Nevertheless these precautions should always be taken and the neglect of them by miners or subordinate employes should be cause for the peremptory discharge of the offender. The storage of stock supplies of dynamite should always be in a structure or magazine at a considerable distance from places where people congregate at work or in moving about. The temperature conditions should be as near constant as can be obtained all the year around. It is better that the powder be kept continually above freezing temperature, or continually below it, rather than alternately frozen and thawed. The latter produces changes in the mixture that free nitro-glycerine from the absorbent and thus increase the risk of handling. At a mine a disused adit, not connected with the mine workings, if dry, makes an excellent storehouse. Blasting caps and fuse should under no circumstances be stored with dynamite. The presence of the fuse is not an element of danger by itself, but it leads to the bringing into the magazine of the blasting caps, which are very dangerous. Powder from the magazine in transit to the point of use should be always handled by the same man or crew. The preparation of the fuse for blasting should be at a point where there is no dynamite even temporarily. The thawing of frozen powder is probably, more than anything else, the cause of accidents. No way of thawing is absolutely safe. Some methods are positively dangerous. Experience has shown the least risk to be by a not too rapid thawing by dry heat, not exceeding 130° F. The vessel used in thawing should be washed and dried after each using. The best grades of fuse and strong blasting caps should invariably be used. Lots of fuse found with defective lengths, and lots of caps, some of which miss exploding, should be discarded and destroyed. Better to lose their cost than to risk accident from their use. The same consideration applies to powder. There should be no hesitation about discarding lots of powder that are uncertain in action. There should be no missfires to investigate. When defective explosives are discarded they should be immediately destroyed. Burn them up under such conditions that if they unexpectedly explode they can do no damage. Some risk is inevitable where dynamite is used, but the rule should be no avoidable risk taken under any circumstances.

Facilities for Mines.

One of the old-time mining men, after listening to a promoter's glowing description of how the mining property he was offering possessed all the facilities, cheap transportation, good climate, fuel and water, turned it down with the comment that if the property had all the facilities described, it could not be a good mine. The old-time mining man said he had always observed that the good mines were always in some inaccessible place, with no kind of a climate at all, and were always short of fuel or water, or of both.

While all good mines are not necessarily where there are no facilities, or indifferent natural provision of them, there are perhaps enough of such good mines so situated to justify the generalization. It is notable also that capital is rather inclined, if its investments can be considered to indicate inclination, to take up the mines that are short on facilities. Instinctively a mining proposition that looks easy is overlooked for one that has difficulties. In some undefined way the overcoming of difficulties in the exploitation of a mine is associated with the idea of larger speculation in it.

The climate of the country where a mine is discovered has to be taken as ready made by nature. In some districts, notably in Colorado, the change from the independent operation of individual mines by shaft openings on the high mountains or slopes, to the joint operation of several mines through a common tunnel outlet into the valleys at the lowest possible elevation has improved the climatic conditions. Differences of climate made by differences of elevation of from 1000 to 2000 feet do make differences in the cost of mine operation. The removal of the base of mine operations from a mountain summit to its base improves the climate and lessens the cost imposed by the climate, independent of all the other improvements in facilities and lessening of costs that it brings.

Cheap transportation is a facility for mine operation that is only exceptionally provided ready made by nature. A partial compensation for this is found in the fact that the discoverers and operators of mines rarely have to provide the facilities for transportation themselves. Where there are good mines found, trails, roads and railroads are built in succession on the expection of sharing in the division of the profit of the mining. The exception is where the mining is a monopoly. Outside capital does not build transportation facilities for mines the operation of which is a monopoly.

Fuel—which means power—and water supply are two facilities in obtaining which the common practice has been for each mining operation to provide for itself. The last half dozen years' indications of a change in the practice, so far as fuel, or power supply, is required, are appearing. The economy of large units of power supply over small ones, and the simplicity of the distant distribution of power afforded by electric transmission, have made the joint provision of power in one undertaking for several mining operations commercially profitable. It is being undertaken more extensively as its economic advantages become more appreciated. In the long run it means lower costs of mine working. The water supply of nearly every mining district has natural limits which lead to its early monopoly. Perhaps more than any other facility, the lack of it makes exploitation of mines impossible, deters it, or limits it. It is notable that many districts in which the showing of value in mines is excellent remain undeveloped indefinitely, solely because there is no available water supply for exploitation. Of all the facilities essential for successful mining, it is so far the one which has received the least development from joint action. It is the one at this time from the development of which the most is to be gained for the mining industry as a whole.

There seems to be no valid reason why the mine operators of a district cannot unite to jointly provide all the facilities for the operation of their mines. They are already directly or indirectly so uniting in some districts to provide some of the facilities. The advantage of a common system of drainage for mines that can be drained by one system is so obvious that union for this purpose is quite common. Union for the joint provision of power and the joint provision of water supply are just as advantageous, though the special local problem to be solved are undoubtedly more difficult. As the mining industry is now carried on, the point of economic efficiency, or the lowest possible cost of metal production is only obtained when all the conditions are measured out into costs, and the separate facilities so balanced that their separate costs charged against mine production added make the lowest of several possible sums. For example, it may be that it makes a lower cost charge against mine production to build a railroad to take ore to a source of water supply than to build a pipe line and pump the water to the mine. In individual mining operations such problems are or should be worked out in advance of construction. They can just as well be worked out for a mining district in advance. The cost of common facilities divided among several mining operations is less to each than the same facilities provided separately for each. Again, they may be possible for all jointly and be prohibitive for each separately.

The most advanced problems of mining engineering are now those which deal with the districts of mines as units rather than with the single mines as the units. They are well worth even tentative discussion. A common waste is just as undesirable and just as much to be avoided as an individual waste. There are substantial advantages gained from individual ownership and operation of individual mines which are lost when mine consolidations are made. The only possible gain by consolidation is a lessening of the cost of facilities that comes from making the unit larger. The purpose of this article is to suggest that mine owners and operators can retain the advantages of individual ownership and operation, and gain those of consolidation, by combining without consolidating to supply the facilities which in greater or less degree all must have.

THE town of Havilah, Kern Co., Cal., one of the oldest mining settlements in the State, is threatened with being wiped off the map by the National Government. The reasons stated are its location within the boundaries of a forest reservation and the neglect of the inhabitants to take a town-site patent to the land. There is an inconsistency here which makes what appears to be an injustice. In the first place, the forest reservations are created by the executive action of the President designating the boundaries. Within some legal limits the President is given the power to modify the boundaries. Existing mining claims and existing grant and agricultural claims are not included in the reservation except through reversion, and there is a question as to reversion with mining claims. Town settlement, however, as an occupancy does not acquire any rights by prescription, and it is not a grant right that an individual by any procedure provided by law could initiate. Only a community has a procedure provided for initiating a grant that would be a vested right. The action of the community must be voluntary. It cannot be made adversely to a claim of mining grant or even to an agricultural claim. The limitations of its initiation are exceedingly narrow. The statutes of prescription have many years since established vested individual possessory rights. The facts will undoubtedly show that when Havilah was first established the public land survey did not include its site, so that no town-site claim could have been made; also that through the early years the site of Havilah was appropriated in mining claims and worked profitably for gold. A town-site claim could not have been made. Doubtless it will show that, even though the mining claims were largely worked out, they have been maintained to an extent that would prevent a town-site claim being lawfully made. The position of the inhabitants of Havilah hardly seems to be due to the neglect of doing something the law makes impossible. The fact that they have no vested title is due to the defect of the law. It hardly seems possible that a court of equity can sustain the Government in wiping the town of Havilah off of the map simply because it is little. It is an injustice that its inhabitants should be at the cost of fighting the attempt.

THE proposed legislation by Congress, to amend the law of mining location in Alaska by making placer mining location by agent or power of attorney void, should go further and make lode locations by agent and power of attorney in Alaska void.

Concentrates.

TONOPAH, Nevada, is situated at an elevation of 6300 feet.

AN electric current can be used to free water of some impurities.

GRAPHITE, or plumbago, is found with gold and silver ores in California and other States.

A METRIC TON is 2204.6 avoirdupois pounds. An English long ton is 2240 avoirdupois pounds.

MANAGEMENT is about 50% of any enterprise, whether it be running a wheelbarrow, a mint, a shop or anything else.

WOOD may be made flexible and non-inflammable by coating it by immersion in a 6% solution of caustic potash or a 5% solution of caustic soda.

FIGURES have been compiled showing that the reduction of copper ores into matte with hot blast can be done at $1.64 per ton. The Granby Smelter, B. C., states it is reducing copper ores to matte at $1.90 per ton.

LONG plumb lines used in transferring connection with surface survey lines into deep shafts are made of fine piano wire. To steady them very heavy plumb bobs are used, which are immersed at the bottom in buckets of water, oil or molasses. The latter is perhaps preferable, owing to its low viscosity.

THE bullion obtained from retorting amalgam should be melted down into a bar at the mine, but the quantity obtained from the average sized stamp milling operation does not justify parting or refining at the mine. It will cost more done at the mine than to have it done at a refinery where it is made a regular business.

IN a Sterling boiler the water should be carried as low as possible on account of the back drum and steam delivery. The amount of water carried on top of the tubes in a horizontal boiler should be about 3 inches on the front end, and, if the boiler is set properly, about 1 inch lower in the back end. Generally a lime water will not foam.

A NOTICE OF LOCATION of placer claim should declare the valuable mineral discovery made or sought to be made. If it is made for oil or gas it should so state. The other provisions of the statute being fully complied with, the courts might hold that the declaration was not essential to the validity of the location. A statement of the fact, however, avoids the possibility of having to refer the question to the courts.

THE decisions of the courts have tended to limit very materially what were supposed to be the broad rights granted tunnel site location claims. The privilege of making such tunnel claim locations is of doubtful value. If possible it is preferable to accomplish the same purpose by making lode claim locations covering the unoccupied surface in the line of the projected tunnel and then use the tunnel construction as the assessment work for all of the claims.

THE tunnel law of Colorado has not been declared unconstitutional by a court of last resort. In respect to its conferring the right on the tunnel owner to drive his tunnel through the claim of another without the latter's consent, a hearing on injunction in the case of the Seaton M. & M. Co. vs. the Tropic M. Co., at Georgetown, Colo., indicated that the courts would decide that it was unconstitutional. The case was withdrawn by the consent being obtained.

THE mining law of Yukon District, Canada, allows a miner the right to stake or claim only one placer claim on each stream or tributary of a stream. The Gold Commissioner at Dawson has decided that the distinction between streams and tributaries must be strictly observed. The decision disallowed the second claims of a number of miners on Conglomerate creek who undertook to get them by giving the upper portion of creek another name, as if it was a real tributary.

"CONCENTRATES" is not able to give individual advice as to mining investments. An honest endeavor is weekly made to give correct technical answers to the multitude of questions received, but it is manifestly without the province of this paper to answer either on this page or by mail any inquiries as to the value or lack of value of any special mine investment. The news is weekly given elsewhere, and special effort is made to have it right, but to pass upon the merits or demerits of specified mine investments would not be practicable.

IN the case of the Cosmopolitan M. Co. vs. Foote et al. (101 Fed. Rep., U. S., 518) it was decided that where by mistake a mining claim was located across, instead of along, the vein passing through the location point, the rights of the locator were governed by the facts as they exist with regard to such vein. His side lines, as located, in that case became end lines, and he is not entitled to any extralateral rights thereunder, although another vein, extending transversely to the one intended to be located, may have apex itself inside of such surface lines.

THE temperature of steam in contact with water depends upon the pressure under which it is generated. At the ordinary atmospheric pressure (14.7 pounds per square inch) its temperature is 212° F. As the pressure is increased, as by the steam being generated in a closed vessel, its temperature and that of the water in its presence increase. Saturated steam is steam of the temperature due to its pressure—not superheated. Superheated steam is steam heated to a temperature above that due to its pressure. Dry steam is steam which contains no moisture. It may be either saturated or superheated. Wet steam is steam containing intermingled moisture, mist or spray. It has the same temperature as dry saturated steam of the same pressure.

TO temper or harden steel it is cooled or chilled rapidly from a temperature of over 1000° F. If the metal is desired soft it is heated to the same high degree of temperature as above and is then cooled very slowly. With brass the processes are reversed. Quick cooling of the heated brass produces a soft malleable metal. To make brass hard, and to give it temper, it must be reheated and then cooled very slowly. It is by this slow cooling that the Chinese prepare the metal of which they make their gongs.

JADE is the common name of a gem stone, or rather rock, which may be one of two minerals distinct in composition. One variety is a silicate of sodium and aluminium called jadeite, corresponding to spodumene, in which the lithium is replaced entirely by sodium. The other variety is a magnesia lime silicate in mineralogy nephrite. The color ranges from almost white to dark green. The stone is hard, tough, breaks with a splintery fracture, and takes a high polish. It is not very common. The discovery in California cannot be considered unusual. It occurs with amphibole and serpentine, both very common formations in California.

ASSAYERS' RETURNS on mill or treatment tests should always be reduced to the original ton unit of ore under examination. This is frequently overlooked and if not understood can be the cause of incorrect deductions from the figures. For example, the assay figures of the final trials where a percentage of concentrates has been taken out in the test assay higher per ton than the real figures of loss per ton on the original ore. The difference is quite important where the percentages of concentrates run very high. Some assayers get into the habit of depending on duplicate assays for the check on the accuracy of their assay work and omit the check on the sampling work which is made by reducing the value and metal quantity figures to the base of the original ton of ore.

FAILURE of a co-owner in a mining location to contribute his proportion of the assessment work creates a forfeiture, after the advertisement of the failure, as provided by the statute, and after neglect by the defaulting co-owner to pay his proportion and costs within ninety days after the publication of notice to pay is completed. The forfeiture is to the other co-owners who do pay and title is vested in them by the operation of the statute. If an outside party, not a co-owner, pays the defaulter's share and costs of publication under an agreement to have the defaulter's share in the event of the latter's failure to redeem, he can only get title by deed from the other co-owners. The deed is best made after the expiration of the ninety-day period during which redemption could be made.

HYDRAULIC rams have not been the subject of close analysis as to efficiencies. There is little information of actual working tests published. Exact uniformity of conditions for comparison has been seldom made, and if made, still more infrequently published. A good hydraulic ram should give over 70% efficiency. A very good one will give over 80% efficiency. Some figures have been published showing efficiences over 90%, but are doubtful. In estimating efficiency allowance should be made for the friction head of the pipes. To get high efficiency use good perfect-seating valves and clean smooth pipes. It is no disadvantage to have the delivery pipe of slightly larger diameter than the makers advise, particularly where the length is considerable. An increase of water delivery is obtained by using two or more rams tandem.

REVERBERATORY smelting of lead ore consists of a combined roasting and reaction process in which the two operations are repeated one after the other. In hearth smelting these two operations, which also constitute the process, are not consecutive but simultaneous, roasting and reduction going on at the same time. In the reverberatory furnace lead is reduced from the ore by the interaction of the unaltered galena, that is, the sulphide, with the sulphate and oxide; in the hearth furnace there is additional reduction from the lead oxide by carbon. The reverberatory is worked without a blast, the hearth with one. In the latter furnace the ore and fuel do not rest upon a solid bed, but upon a bath of molten lead. The charge in the hearth furnace is never fused, but at intervals the blast is stopped, a portion of the charge removed, the poor slag separated from it, and after cooling and an admixture of lime to stiffen it, the charge portion is returned to the furnace.

STAMP MILLS or other crushing machinery are used in working some California placer mines because the gravel containing the gold has become so hard and cemented that washing alone will not break it apart and free the gold. The cementing material is in some mines silica or lime; in others it is ferrous oxide and in still others pyrite. The ferrous oxide is the result of the oxidization of pyrite by a continuous submerging flow of surface waters. It gives the characteristic color to "blue gravel." Where the flow of surface waters is intermittent, and its place taken in the intervals by the atmosphere, the oxidization is carried further and ferric oxide results, which is only lightly, if at all, cementing on the gravel mass. This oxidization makes the red gravel. Pyritic cementation almost certainly is produced by uprising sub-surface waters, and silica and lime cementation most probably by surface waters. Generally the cementation is only partially complete, making an agglomerate rather than a conglomerate, the distinction being that the first disintegrates into its original constituent particles and masses, and the latter does not, the cementation being complete, making the mass of equal hardness throughout. Some of the cemented gravels require quite fine crushing to free the gold, others only a stirring or tearing apart under water.

IN ordering or designing hoisting engines it is absolutely necessary that the exact meaning of the word "load" shall be thoroughly understood by both maker and buyer. It is accordingly becoming the custom to have all the details described and so stated that they can not only be understood, but that they can not be misunderstood. The amount of ore raised may be called the net load, and the weight of ore, cage and rope the total load. In the case of flat rope hoisting in a deep shaft, the weight of the rope may be greater than the remainder of the total load. So that the weight of the rope has manifestly great influence in determining the size of the hoisting engine to be employed. Where hoisting is done with the weight of certain parts of the total load counterbalancing the weight of others, the hoisting is in balance. The remaining weight is unbalanced load, and is that which the engine must lift; but the strength of the various parts, such as clutches, shaft, etc., must be proportioned to stand the total load.

THE first process in refining petroleum is selective distillation, during which the petroleum is passed through various stills at different temperatures, the temperature of the petroleum being increased at intervals during the process. At the lowest temperature gases are given off, which remain as such at the ordinary temperatures of the atmosphere. Then, as the temperature is increased, petroleum, ether, benzine, C naphtha, B naphtha, A naphtha, illuminating oil (kerosene), lubricating oils, paraffine wax, tar and coke come off in the order named. They are the so-called naphthas that are of special interest to the gasoline engine user. C naphtha ranging in density from 80° to 68° Baume, is that which is used on a gasoline engine, the common densities for the purpose being 76° to 74°, the latter being known as stove gasoline. Each of these petroleum products may be further subdivided by selective distillation, into substances having different densities. In fact, the ordinary gasoline of commerce is in reality a mixture of various hydrocarbons of different densities, the average density of the mixture being that at which the gasoline is rated. It is this circumstance that is the cause of nearly all the troubles with carhureters, as it is the tendency of the lighter products contained in the mixture to evaporate before the heavier products.

AT the Minnesota iron mine, Tower, Minn., as first mined, the ore comes out in huge chunks of nearly the hardness of steel, expensive to handle, both at the mine and during transit to the furnace, and requires more fuel to smelt than ore in moderate-sized pieces. Huge crushers were erected near the shaft-houses and the ore trammed directly to them. Ponderous iron jaws, weighing ten tons each, crush it to pieces that will pass a 4-inch aperture, after which it is dumped on the stock piles. Previous to this, during the shipping season, it took several hundred men, using shovel and barrow, to load the ore into cars. One immense steam shovel, with six or eight men, now does the same work, making a record in keeping with the improvements elsewhere about the mine. Its dipper holds 3½ tons, and, when working steadily, fills a 25-ton car in two minutes. It has loaded 192 cars in a day of fourteen hours, approximately 4800 gross tons. Another improvement which has greatly reduced the cost of mining is the substitution of machine drills, driven by compressed air, for the hammer and drill in the hands of the old-timer. There are now employed 600 men, who get out nearly the same amount of ore as ten years ago, with a daily average of more than two tons per man, and at a cost of less than $1 a ton.

A VOLUMETRIC DETERMINATION of copper by potassium cyanide solution is as follows: Dissolve 10 grammes of potassium cyanide in 250 cc. of water and mix thoroughly. Weigh 2 grammes of pure copper wire, transfer to a one-fourth liter flask, add 25 cc. nitric acid and warm gently until the copper is all dissolved; boil to expel oxides of nitrogen; cool, dilute with water to the mark and mix well. Take 50 cc. of this copper solution, transfer to a No. 3 beaker, add ammonium hydroxide until the precipitate formed dissolves and the solution is alkaline. Fill a 50 cc. burette with the potassium cyanide solution, and gradually drop the cyanide solution into the copper solution until the blue color disappears and the solution becomes colorless. Note the number of cubic centimeters of potassium cyanide solution required to do this, and mark upon the potassium cyanide bottle the value of 1 cc. in terms of copper. Thus: Suppose 50 cc. of the copper solution required 31.3 cc. of potassium cyanide solution, then 31.3 cc. KCN = 0.40 gramme Cu and 1 cc. KCN = 0.0127 gramme Cu. Having thus obtained the value of the potassium cyanide solution, it can be used for determining percentages of copper in alloys, bronzes, etc. For example, brass: Two grammes of brass are weighed out and treated with 25 cc. nitric acid, and the solution made up to 250 cc; 50 cc. of this solution are made alkaline with ammonium hydroxide and titrated with the potassium cyanide solution. Having determined the number of cubic centimeters of potassium cyanide solution required to decolorize the 50 cc. of the brass solution, the percentage of copper is calculated from the above data.

Treatment of Refractory Silver and Gold Ores at the Mine.

Written for the MINING AND SCIENTIFIC PRESS by R. C. CAMPBELL-JOHNSON, M. I. M. M.

British Columbia has a problem to solve of such importance that its satisfactory solution means the difference between life and death to her silver mining industry.

The fact is that nature has been bounteous in placing immense mineral wealth in her mountains, this mineral not necessarily more phenomenally rich than that in other lands, but in endless quantity. Having this natural advantage, how is British Columbia to transmute this mineral, when wrought so cheaply, into marketable metals that they may compete with profit in the world's great emporium?

There are other interests which try to make a living out of the mining industry, and which go further, taking the cream off the profits, though their share of the risks and work is a very secondary part. Transportation interests and smelting works are the interests referred to, against which mine owners at present have to contend. It is no illusion to believe that British Columbia in the near future, if successful in solving this trade problem, will regulate the price of silver and lead to the world from her abundant store.

Let us take and examine a map of the North American continent showing the mountain chains. Mexico has mountains, but less than those in the United States. British Columbia, however, has all the ranges between Colorado and the Pacific, which have been and are producing such untold riches, converged into her territory for 800 miles north and south, and for 400 miles east and west, covering 390,000 square miles, all of it mineralized with some metal of commercial value. This mineralization is no fairy tale, but a fact proved by the work of the hardy prospectors.

The transportation companies of Canada are wisely made subservient to the dictates of the Government as to rates when bonused by the people's money. Smelter trusts fail if the mine owners can produce marketable metals without their aid. In showing how British Columbia is to avoid dependence on these interests, the writer remembers that there are other mining districts in other lands that have the same problem, and that perhaps an account of her means will be of interest to miners in these districts.

As an universal treatment for all ores indiscriminately is an impossibility, and since modifications for each individual ore have to be introduced as found necessary by the metallurgist in charge, we must describe the character of the ores in British Columbia which we propose to enrich by mechanical means first. They are known as dry and wet ores, sometimes carrying both the precious metals—gold and silver—and sometimes only one. By a wet ore is meant one that in its composition contains over 10% of lead, probably also zinc, with small proportions of antimony, copper or iron, each combined with sulphur. By a dry ore is meant one that contains less than 10% of lead, or very little at all. In these ores the precious metals are partly alloyed with the base ones, and partly unalloyed in the form of native metals, or sulphides, as in argentite, ruby silver, etc. Chloride of silver is sometimes present. As all chemical treatments, whether by heat or solution, cost money, it is evident that the first stage must be to enrich the values by reducing the bulk. This is accomplished by mechanical concentration to eliminate valueless rock, but at the same time not to concentrate so closely as to throw away values with the discarded tailings.

In this class of silver-bearing ores experience has taught metallurgists that wet concentration, to save 95% of the values, is not effective on account of the silver slimes continuing in suspension in water. Therefore a system of dry concentration is a sine qua non. To crush large quantities dry there are many machines for sale—stamp mills, crushers, rolls, ball mills and many others. In choosing a mill there are two special conditions to be thought of besides rapidity—first, the loss of iron on the castings through wear and tear, which means cost per ton of ore ground in replacing parts and repairs, and, second, even more important, the size required for the material ground. Many machines grind the stuff to pass screens of eighty or more holes to the lineal inch, for our purpose unnecessarily fine, and giving more trouble in making a satisfactory separation in fines of value from waste. The most easily treated sizes are from thirty to sixty mesh, according to the needs of the ore being treated.

Having now crushed our ore with all the requisite contingencies carried out, as previous drying, if necessary, fans to draw off the dust, and the other complements known to the profession, the next stage is classification into sizes, dividing stuff of thirty mesh from forty, and so on, that specific gravity may have full play in separating good from waste.

There is an English-made machine which has a revolving hopper perforated around the lower end which stands vertically in a large iron, stationary, rounded basin. This basin has at intervals in height shelves riveted around the inside. Specific gravity throws the heavy material from the revolving hopper into the shelf farthest away, and the lighter material into those shelves nearer, making an excellent separation. Revolving brooms and hoes deliver the material from the shelves through holes on the outside into launders leading to bins. This simple machine makes wonderfully clean separation for sized material say larger than sixty mesh. To separate finer stuff again sized, we must use something of the "terra seca" pattern, as employed to separate gold from sand on the Arizona desert. These machines are inclined wire screens, onto which the fines fall from distributing feeders. There is an intermittent puff of air made to rise through the wire screens with force under control. This is an effective separation for the fines. Having now eliminated the bulk of our waste with loss of very little of the values, we have to treat the concentrated material and produce marketable metals.

A process commercially used on Broken Hill ore in Australia would seem to be available here. The plant is a species of bessemer converter, with mouth leading into a closed chamber. These metallurgists have discovered how, in a sulphide ore heated to a low temperature, chlorine gas will drive out the sulphur, taking its place and not combining with it; so in this converter heated by electrical poles, not by fuel, on the introduction of dry chlorine a chloride of zinc, lead, gold and silver is formed, leaving the silica (quartz) unacted upon.

Metallic zinc has greater affinity for chlorine than lead, gold and silver, and is, therefore, introduced in sufficient quantity to satisfy the chlorine present, forming chloride of zinc and molten metallic lead, carrying the gold and silver. The molten metal is now tapped off, refined and the metals sold separately, for acid can be produced from the sulphurous fumes.

The chloride of zinc is leached out, precipitated, reconverted into metallic zinc and free chlorine, as much of the zinc being used again in fresh charges as is required and for desilverizing the lead, and the balance is ready for market. A successful process to separate by electricity common salt into its component elements—free chlorine and free sodium—has been invented. Thus to treat silver and gold ores at the mine the only material to be transported is common salt, electricity carrying out all the rest of the process and working the machinery.

As British Columbia has abundant water powers from her creeks throughout the mountains, this complete process seems suitable to her ores, producing marketable metals as cheaply as elsewhere, if not cheaper.

We hope, therefore, to avoid dependence on the smelting trust here, to get more favorable transportation charges, and to justify our promise that British Columbia will regulate the price of silver and lead to the world.

The Liberal Gold Mine, Hailey, Idaho.*

Written for the MINING AND SCIENTIFIC PRESS by F. C. MANDELL.

The Liberal mine comprises thirty full claims, located on the gold belt, 27 miles west of Hailey, Blaine county, Idaho. The illustration herewith shows the mine buildings and environment.

Practically all the development has been made in the past eighteen months and consists of a crosscut adit 150 feet long to the lode, whence the vein has been drifted upon for 400 feet. From this tunnel an upraise 159 feet long follows the vein to the surface. There is also an incline shaft dipping 45°, sunk beneath and parallel with the vein, 100 feet deep, from the bottom of which the ore has been recently tapped by a crosscut.

The vein is quartz, having an average width of 8 feet, carrying, as far as developed, an auriferous iron pyrite. Values as high as $100 per ton are found, but the average value throughout the workings is between $8 and $9. A continuous shoot of ore is exposed along the 400 feet of drift and up the raise to the surface, as well as in the crosscut from the bottom of the incline 100 feet below. The ore is readily concentratable and ultimately some mode of concentration treatment will be adopted and a plant built. The strike is northwest and southeast and the dip is 45° to northeast. The country rock is an eruptive granite somewhat metamorphosed, locally, by a porphyry dyke, 25 feet wide, which forms the front wall. D. S. Richards is Supt. and F. R. Reed manager.

*See illustration on front page.

THE U. S. Geological Survey states the number of springs of mineral water on the list as utilized during 1900 is larger than for any previous year, the net increase over 1899 being twenty. Thirty-seven springs have been added and nineteen dropped, making a total number for 1900, 561 as against 541 for 1899. The number of springs actually reporting sales is 491, more by twelve than the number for 1899. The amount of waters sold in 1900 exceeds the record for 1899 by about 8,000,000 gallons, and shows a loss of about $700,000 in value. The price per gallon fell from 17.5 cents in 1899 to 12.5 in 1900.

The Homestake, S. D., Milling Process.

Written by a Former Mill Foreman.

As the ore is hoisted from the mine, it is dumped into Gates crushers, where it is broken the sizes of 3 inches or under. Large ore bins that have been excavated from the solid rock immediately under these crushers receive the broken ore, from which it is drawn through chutes into two-ton cars. These are drawn into the tops of the mills by steam locomotives (which are soon to be replaced by compressed air locomotives). The ore is brought in by trains of about twenty cars each. The mill bins, into which it is dumped, have a capacity of about 1700 tons, or forty-eight hours run. The bins being in the top of the mill, the ore passes through by gravity. Ore passes from the bins into automatic feeders that feed it into the stamp battery as required. The feeder is operated from one of the stamps which throws a little ore into the battery each time the stamp drops. These feeders are regulated and attended to by two men on each shift. There is one of these automatic feeders to each battery of five stamps. These stamps weigh from 800 to 950 pounds, the weight depending on the length of time the iron has worn. A stamp is composed of stem, tappet, hosshead and shoe. The shoe is a case-hardened casting weighing 150 pounds and has to be renewed every sixty days. The die in the bottom of the mortar that the ore is crushed on is renewed every forty days. The ore is crushed to pass through what is known as a No. 8 diagonal slot steel screen, equal to about 35-mesh. Mercury is fed into the battery every thirty minutes by a man who examines the outer plates to see the amount required, which depends, of course, on the richness of the ore. The usual amount at one feed is about a wooden mustard spoonfull. The mercury forms an amalgam with the fine particles of gold as they are freed from the encasing rock that encloses them. This amalgam has a great affinity for copper or silver. About twenty gallons of water per minute is discharged into each battery with the ore. This forms a thin pulp that passes out through the above mentioned screens, and in doing so, it passes over copper plates. The first one is inside the battery and immediately under the screen. It is 54x6 inches in size. After passing through the screen, it passes first over a plain copper plate 10 feet by 54 inches in size, then over 36 by 54 inches of silver-plated copper. The coarser and heavier amalgam is caught on the first plates, which is shown from the value of the amalgam. That caught on the inside plate is worth about $8 per troy ounce, while that recovered from the last 12 feet is only worth $1.50 per ounce. These outer plates are cleaned up every twenty-four hours with heavy whiskbrooms, always leaving a good coat of soft amalgam on them. When the amalgam is found to be a little too stiff, mercury is sprinkled on from a bottle with a piece of eight-ounce canvas tied over the mouth of it. It requires nearly $1000 worth of amalgam to put a new copper plate 12 feet by 54 inches in good working order.

The chuck block, as we call it, or the inside copper, is cleaned every fourteen days. The amalgam becomes very hard on this copper and has to be removed with steel scrapers. There are about 10,000 ounces of mercury used a month in one of these 200-stamp mills. Of this, there is lost about 10% by its being divided into such fine particles that it floats off in the tailings. The other is recovered when the amalgam is retorted and it is used again.

The amalgam is retorted every ten days and the resultant bullion is immediately taken in charge by the American Express Co. The tailings pass from the mill to the gig plant, where they are concentrated to save the sulphides that refuse to amalgamate. From there they are conducted to the cyanide plant.

The mills are the Golden Star, which has 200 stamps, Homestake 200, Amicus 140, Deadwood Terra 160, Caledonia 100, and the DeSmet with 100 stamps. These stamps crush a little over four tons each per twenty-four hours. They are lifted by a cam coming in contact with the tappet and drop of their own gravity eighty-eight times per minute. The 200-stamp mills are driven by 500 H. P. Corliss, compound, condensing engines. Steam is furnished by four upright tubular boilers that consume about fourteen tons of coal per day of twenty-four hours.

It has been found by repeated tests that the best temperature of water used for saving in the battery the greatest amount of amalgam is between 45° and 55° F. When the water becomes too warm the amalgam softens and is dragged off the plates by the action of the pulp. When the water is too cold amalgamation takes place too slowly.—Black Hills Mining Review.

IMPROVEMENTS in the efficiency of generators have been for some years a matter of little moment to the electrical designer. The electrical generator is the most efficient mechanism in the world. The loss of energy in it is only 2% or 3%, and if there were any special object in doing away with this slight loss it could easily be reduced to a fraction of 1%.

Driving Tunnels by Hand.

Written for the MINING AND SCIENTIFIC PRESS by J. H. SHOCKLEY, A. I. M. E.

Having driven hy hand in the past two years over 2 miles of tunnel in the mountains of San Juan, where the metalliferous bearing formation is principally an igneous rock, consisting of bedded tuffs, breccias and commingled agglomerate of andesitic materials, covering the greater portion of the mining districts in an immense sheet in which the principal mines are found to a maximum thickness of perhaps 6500 feet, it would seem that in this extensive and intensely mineralized area nearly all the features encountered in ordinary tunnel work might he found. Rocks so metamorphosed hy replacement as to he difficult to detect andesitic origin have been driven through. Their normal constituents have heen so indurated, so subhstituted with secondary siliceous matter, pyrites, etc., that they form close-grained rocks, hard to drill and which hreak in a most "short" and unsatisfactory way. On the other hand, faulted, fractured zones, carrying great water courses, filled with unctuous masses of oozing talcose material, large and small irregular boulders—attrition products necessarily formed in these profound lines of weakness in the crust of the earth, which, no douht, have more than once acted their part in the mountain building—have heen encountered and opened under conditions where skillful work is necessary to hold the ground and procure economical, rapid headway. All of the above conditions were found in the Turkey Creek tunnel in Watton Basin during the past year, yet an average headway of 125 feet per month was made. As a practical art, aye, almost a science, tunnelling is perhaps not so fully understood as it should be, and after an experience of nearly twenty years throughout North America, a few points thought to he of value may he suggested, to wit:

In hard, close-grained, tight ground, in single track hand-worked tunnels, keep your tunnel not less than 4½x7 feet, room enough for the ground to hreak and work double handed. Don't let the miners get too much ground on their holes therehy causing a lot of "guns" to he in constant evidence. If miners persist in reloading "guns" discharge them. Never let the breast "coop" in on you so that it looks concave, that is, don't gouge out the center. Keep the corners out, the hottom down, the roof up, and the sides straight, these are vital points. See that the shift going off leaves the hreast in good shape for the one going on, don't let one shift gouge on the other, for if a shift has to take up "hottoms," heighten the "roof" and widen out the sides it means material loss of headway, and neither will good miners do this very long for the other shift. Have a hlacksmith who is an expert with steel, as poor drills are an aggravation to the whole works, and give the men plenty of them; ⅞-inch steel is hest. Don't be stingy of powder in hard ground.

In medium, easy drilling ground, work two men in the hreast on a shift, single handed. You cannot do good work without good air; see that the men have it. Keep the track up close to the breast and give the muckers steel plates to shovel off of; see that the dirt from the hreast is turned hack on these after shooting; they must he laid down, of course, before shooting. As an average give the track a grade of 7½ inches in 100 feet, and see that the trackmen always use the grade sticks in laying the track. Cars that hold about a ton of rock are the hest. Make the muckers use the chain when dumping so that the car won't be going over the dump all the time. Use good hig ties, that will hold the spikes, and put them 30 inches apart for ordinary track. Keep the track up and clean. Don't let the dirt accumulate hehind the miners in the hreast; keep it trammed out so that you can see how things look and the men he ahle to judge about laying their track and putting in their holes. Mucking is the hardest work around that joh, so have enough muckers so that they can keep caught up. Remember, that they will handle more fine stuff in less time than if it is coarse: another good reason for plenty of powder.

In soft, caving ground, where close timhering is necessary, the drills can most often he done away with; then use the "hull stick;" a 42-inch or 48-inch pointed har of steel, 1⅛-inch at the hig end, with a head on it or a ring to get it out with after it is driven in. Using this is far hetter than drilling. And if the ground is quite stiff go at it douhle handed, that is that let one man pound the "hull stick" for a while with an eight-pound hammer, and then let his partner go at it, while the other is taking a hlow, as this work is very fatiguing at times. More often, however, in this character of ground one man can fill the hreast pretty well with holes during his one-half shift. A set of timhers a day should he put in 5 feet apart, mudsills, caps, posts, lagging and all. Don't give the ground a chance to cave and get away from you, hut keep the timhers well up to the hreast, and have the tunnel wide and high enough so that when you are ready for the set that you have not got to monkey around and cut a lot more ground before they will go in, and therehy keep one-half the gang doing nothing. Point the roof lagging a little up, so that in driving them they will he sure and land over the top of the next cap in front. In swelling ground have the lagging a little way apart, so that you can pick out the ground and relieve the pressure; also put in mudsills, for posts without sills will settle and conscquently cause endless trouhle.

Have long, light, well-handled picks without too much of a hook to them, and keep all tools in a perfect condition at all times. Often tunnels are driven on veins and in ground so constituted that holes will hreak no matter where they are put, hut frequently on veins there will he a small, soft streak, with the rest of the veiu very resistent; here use the "hull stick" in the soft streak, and cut it out ahead for several feet, say from 3 feet to 6 feet, then drop hack and with the drills, a long half upper with one or two down holes, will form the drift; especially if the vein pitches, which most always is the case. This cutting ahead process of course gives the other holes a fine show to hreak. The ahove points, coupled with a due appreciation of your men, should give good results, and while it is difficult to lay down a hard and fast set of rules for any kind of work similar to hand tunnelling, it will he found that the application of the ahove suggestions, as far as practicahle, will increase the average headway maintained in the ordinary tunnel.

Valuable Testimonials to Value.

A Silver Star, Mont., suhscriber writes: "I have the hest work on the cyanide process in existence. It consists of clippings on that suhject from your paper."

A Cripple Creek, Colo., mill man says: "I have learned more from the MINING AND SCIENTIFIC PRESS ahout concentration than from any other source."

A Prescott, Ariz., mine superintendent says: "Yours is emphatically the paper for the miner, and I always trust your advertisers. You have never yet fooled me with a fake advertiser, and I've heen taking your paper for twenty years."

A Deadwood, S. D., cyanider sends a list comprising forty-seven different expert articles on the cyanide process, and says: "Each one of those is in my scrap book, clipped from the MINING AND SCIENTIFIC PRESS, and I consider the collection of unequaled value anywhere."

A Grass Valley, Cal., reader writes: "I find more value in "Concentrates" than any other printed page received from any source. I consider the MINING AND SCIENTIFIC PRESS the best mining publication in existence, and I get ahout all there are."

A Kalgoorlie, Australia, suhscriher says: "When one copy of your paper is missed there is prompt complaint. We all look for it and think it the hest of all of them."

A Hailey, Idaho, suhscriher says: "Find enclosed $3 for renewal of suhscription. I part with this money with more satisfaction to myself than with any laid out for any other puhlication, and I take many of them."

A New York City mining engineer says: "Enclosed is $3 for another year's suhscription to the hest mining paper puhlished. It is worth $1000 a year to me."

A Nelson, B. C., suhscriher says: "Reliahility in your statements and in the advertisements you puhlish makes your paper respected in this section, where it has many friends."

From Chihuahua, Mexico, a writer asserts that "We all like the MINING AND SCIENTIFIC PRESS. It is not afraid to tell the truth and always gives information of great value to every miner."

One southern California subscriher makes an assertion that we have heard hefore, hut to which we are not prepared to implicitly assent. He says: "In this place when a witness is to be sworn in the justice court, in the ahsence of the Bihle we swear him on a copy of the MINING AND SCIENTIFIC PRESS." Still, the idea is all right.

"The original articles, 'written hy the men who do the things they talk ahout,' are to me of the utmost value. I learn a great deal from your paper and keep every issue," is what an Antofagasta, Chile, suhscriher writes.

"I read much of what you weekly print copied in other papers, hut like to read the advertisements of reliable concerns that you weekly puhlish," is the statement of a Nogales, Ariz., reader.

"There is a lot of things that I like about your paper—its truth, accuracy and scope—hut I helieve I hold in highest value the many original papers you puhlish, written for you hy practical mining men," is how a Cripple Creek, Colo., mine manager views it.

The ahove are from a large number of similar statements received during the first month of 1902, and are indicative of how our readers feel toward this journal."

IT is claimed that the hest luhricant to use on aluminum when turning it on a lathe is either petroleum or water, and when stamping it in the press or drawing it, vaseline.

The Rio Tinto, Spain, Mines.

R. E. Palmer, formerly of Rosslaud, B. C., and now assistant manager at the Rio Tinto copper mines in Spain, in a letter gives some details of the method of mining employed.

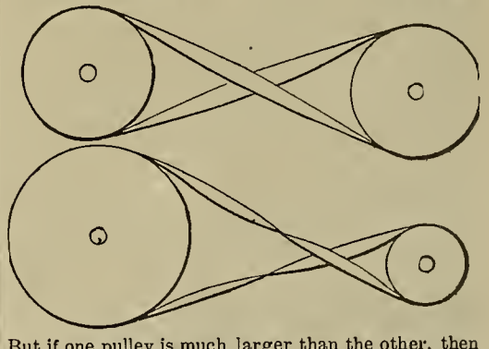
"This is such a huge place that it is difficult to describe," says Mr. Palmer. "This year we have moved a little over 2,000,000 tons of copper ore, hesides 700,000 to 800,000 cuhic meters (ahout 3,000,000 tons) of iron cap. We have a smelter and hessemerizing plant, hig copper washing tanks, sulphate of copper works, sulphuric acid works, two hig open quarries working, two hig underground mines, 60 miles of railroad from here to Huelva, hig loading piers, workshops, and so many other minor things that it would take hours to describe each. We employ 11,000 men and hoys, the average pay heing 15 reals per day, or 60 cents in gold. We have every kind of pyritic ore, from ore containing 50% sulphur and no copper to that containing varying sulphur and 20% copper. The mineral is in hig masses, lying in porphyry or hetween porphyry and slate, and covered hy 50 to 60 meters of iron cap, fairly well decomposed and soft. This is removed in terraces and henches hy locomotives, and the mineral is quarried down to a certain level. Below this limit the mineral is mined, and all this work is mine. This year I made a good record, raising 765,000 tons of ore through two shafts.

"The masses of mineral are enormous. One on which I am working is ahout 3000 feet long, never less than 50 feet wide, while at one point ahout 1000 feet down it is 660 feet wide of solid mineral. There is no hunting for ore—the question is economical extraction and classification, the latter an important item. Timher is very expensive, and although we use a great quantity our mining operations are conducted practically without it. The system of mining here is what is termed 'pillar and stall'—that is, every 12½ meters a floor or level is opened 4 meters high, and the whole floor divided into galleries and crosscuts 4x4 meters, leaving in place supporting columns 6 meters square, the extraction of ore heing provided by the openings. This is expensive work, the mineral heing very hard and tough, and the operations are practically of an explorative nature. One man, hand work, with a douhle-handed hammer, hreaks ahout one and one-fifth tons per shift, all on contract or piece work. Between the roofs of these galleries and the floors ahove were left, of course, 8½ meters of solid mineral.

"The Spaniards do a good day's work if put on a task, hut will do nothing hy day's lahor if they have no contract or task. It is next to starvation for a man if he is discharged, so we have control over the miners. They are more or less like children, and if they don't do their duty we fine them a couple of days' work or send them home for a week. We have to he very stern with them. We don't work the men on Sundays, and their tasks are generally done in eight or nine hours."

To Make Cross Belts Run Smoothly.

What are usually known as cross helts are very common in driving machinery, and it is a well-known fact that they run hest when the two pulleys which they connect are somewhere near one size. But sometimes it is necessary to use a cross helt on pulleys of very different diameters. This may he done and still have the helt run smoothly. If the helt connects two horizontal shafts on the same level, and is given the ordinary turn or twist, it will naturally stand in a vertical position at a point midway hetween the two shafts. Now, if the two pulleys are of one size, this midway point is the natural crossing place for the two parts of the helt and all goes well.



But if one pulley is much larger than the other, then the helt must cross at a point much nearer the small pulley than the larger one, and with the ordinary twist the two parts of the helt are apt to quarrel, so to speak, at this point. To remedy this, in many cases it is only necessary to give the two parts of the helt an extra twist as they pass from one pulley to the other. The helt then will stand vertical at two points, marking the thirds of the distance hetween the shafts, and if the pulleys are of such sizes that the helt crosses at or near one of these points they will run smoothly again and with very little friction.

Thunder Mountain and Mackay, Idaho.

Written for the MINING AND SCIENTIFIC PRESS by ROBERT BELL.

The extension of the Salmon River Railway through the central part of Idaho to the western horder of the State promises to mark a most important period in the mining history of this commonwealth, as it will open up an easy means of access to one of the largest, richest and at present most inaccessihle undeveloped mining fields in the United States.

This region of rough mountains and canyons is well watered and timhered, and is especially adapted for metalliferous mining. It is a region occupied almost exclusively hy primary and igneous formations, the richness of which in metals is already demonstrated in a measure hy the fact that from within the Salmon river drainage, to which it is principally trihutary, there has heen produced to date fully $75,000,000 worth of placer gold. In addition to gold, which is found associated with almost all the ore of this region, the other metals, particularly copper, are exceptionaly well represented.

The new Thunder Mountain district, which promises to prove a great producer of gold, is situated hetween the head of Marhle creek and Big creek, two trihutary streams that lap past each other at their source and enter the main Middle Fork of Salmon river 60 miles apart from the west side.

The Government map of Idaho does not show the location of Thunder mountain nor of Marble creek, hut hy measuring off 20 miles on the map northwest of the mouth of Loon creek, which enters the Middle Fork from the east, ahove Camas creek, you will have the initial point.

The formation of Thunder mountain consists almost entirely of eruptives, principally in great heds, dikes and overflows of rhyolite porphyry, with immense accumulations of hrecciated material and occasional domes and vents of hasaltic andesite. Pieces of charred and petrified wood that seems to have heen picked up hy a stream of rhyolite mud are occasionally found rich in gold, also hands of smooth-grained felsite rock, slaty sections of which have a very resonant sound, like phonolite, when struck with a steel tool, hut lack the grain and structural characteristics of Cripple Creek phonolite.

The rock formations of the region hounding Thunder mountain to the northeast are principally crystalline schists, gneiss, and great systems of diorite, syenite and porphyry dikes, which carry some immense hedded deposits of copper sulphide ore, rich in gold. Southwest of the mountain the formations are principally granite. with extensive igneous intrusions.

The hest known development of this new El Dorado at present is the Dewey group of claims, situated near the summit of Thunder mountain at an altitude of 8000 feet. This property was hought last fall from the original locators hy W. H. Dewey and associates of Pittshurg, Pa., for $100,000. It has heen visited and examined hy a numher of mining men and is described hy them as a hed or zone of soft friahle rhyolite porphyry of a light gray color fully 600 feet wide, and exposed on the Dewey property for several thousand feet. The deposit has already heen developed hy 700 feet of tunnels and crosscuts that have gained a vertical depth at one point of 140 feet. The entire length of all these workings is in pay ore that is said to carry an average value of $7 per ton in free gold, with one quartz seam 4 feet wide, assaying $1000 per ton. Some astonishingly rich specimens have heen hrought out from this pay streak. One of them recently on exhihition in Boise weighed thirty pounds and was estimated to contain over $300 worth of visihle gold.

With unlimited water power in the near vicinity of the mines it is estimated that this ore can be mined and milled on a large scale for not to exceed $1 per ton. The company already have a 10-stamp mill on the mine, which was packed in on mules and is now in operation, for the purpose of making practical working tests, and they are now planning for the erection of a 100-stamp mill as soon as a wagon road can he huilt into the property.

The gold occurs native in the rhyolite matrix, in size from the finest particles to large dendritic accretions lining the joint planes, some of them as large as the palm of a man's hand. The material is perfectly free milling so far, and, with the exception of a faint yellow stain, suggesting the presence of lead, and a slight accumulation of live iron pyrites in the fracture planes, shows no other evidence of hase ore. The Thunder mountain gold is light colored; it carries a large amount of silver and is worth ahout $12 per ounce.

A large numher of claims were located in the immediate vicinity of Thunder mountain last summer, hut a vast region of practically unexplored country surrounds it for many miles, and several similar centers of eruptive activity are known of that may prove equally as rich upon investigation. The ahove is helieved to he especially true of the country lying east and along the road approaching Thunder mountain from Mackay and from Salmon City. At Carmen creek, Deep creek and Silver creek in Lemni county, and at Lava creek, Stanley hasin and Jordon creek in Custer county, centers of volcanic activity have occurred which greatly resemhle Thunder mountain, with great heds and dikes of light colored volcanic material that carrys gold values at the surface, from a trace to $6 or $8 per ton, and occasional specimen values that run up in the thousands.

There are half a dozen ways of approaching Thunder mountain, all of which possess local geographical advantages, hut most of them are over highly elevated mountain roads and trails, where the snow usually lies deep and late in the spring, making travel not only slow and difficult, hut also somewhat dangerous at that period of the year.

The nearest railway approach to the new El Dorado is Mackay, the present terminus of the Salmon River Railway, from where there is an excellent wagon road to Singiser, 100 miles distant, and from Singiser it is only 60 miles over a good trail to Thunder mountain. This route will he open to safe and convenient travel fully a month or six weeks earlier than any other, owing to the fact that on an average it traverses a much lower line of elevation, with the only one important summit to cross, the Morgan Creek pass, at an elevation of 7500 feet, where deep snow is likely to he encountered for a distance of ahout 6 miles, as against 25 to 100 miles of heavy snow country over the various other roads. Geologically this road to Thunder mountain traverses the most varied and interesting section of Idaho, while the facilities it offers for prospecting, hunting and fishing, and for good water and grass during the open season, are unexcelled.

One railway company has a large corps of engineers in the field at the present time permanently locating their Salmon river line from Mackay toward Thunder mountain, and it is reported that active construction will he commenced as soon as a 25-mile section of the survey has heen completed, and the line pushed on to the Salmon river at Challis as rapidly as possihle.

The Salmon River Railway leaves the Butte hranch of the Oregon Short Line at Blackfoot, a station 24 miles north of Pocatello. The new railway strikes due west from Blackfoot hottoms across a hroad sagehrush plain to Arco, distant 60 miles out and situated at the entrance to the Big Lost River valley. Arco dates its existence from the arrival of the railway last Septemher. It already has a numher of very suhstantial huildings. It is the natural supply and shipping point for extensive mining in Little Lost river to the north. The ores of this district are principally lead, silver and copper, hut all carry a little gold. Some of the deposits are very large concentrating propositions. The formations consist principally of quartzite, dolomite, hlue lime and shale, and great intrusions of gray diorite and quartz porphyry. South of Arco the Lava Creek district is 16 miles distant over a good road. This district has heen noted for its production of very rich horn silver ore. It has as well mines on large, well defined fissure veins carrying silver-lead ores. There is also a dike of vesicular gray porphyry several hundred feet wide that carries from a trace to $10 per ton in gold. The formations are similar to Little Lost river, with a good deal of lava added.

The town of Mackay, the present terminus of the Salmon River Railway, 85 miles from Blackfoot, was laid out on the level hottom of Big Lost River valley Oct. 1, 1901, at a point 4 miles ahove the old town of Houston. It now has 150 suhstantial huildings, including a first-class hotel, and, though less than four months old, already has a population of 1200 people.

The White Knoh Copper Co., in which John W. Mackay and associates of New York are interested, has heen developing the White Knoh group of copper mines with a force of from forty to fifty men for the past three years, and are at the present time employing over 200 men. They have, it is claimed, pay ore already hlocked out sufficient to run their large smelting plant for several years to come. It is estimated that the improvements projected hy this company and now well under way will have cost not less than $1,000,000 when completed. Among the principal features of this equipment is a complete copper smelting plant, with a daily capacity of 600 tons, nearing completion, planned to make copper direct from the ore in one operation. The ores are thoroughly oxidized for considerahle depth helow the surface, and, from the comhination of their enclosing formations and matrix, are practically self-fluxing. The foundations of this plant are so designed that it can he very conveniently changed to a matting plant when the sulphide ores make their appearance at deeper levels.

The White Knoh copper vein is a contact hetween a hlue lime hanging and porphyry foot wall. It is from 10 feet to 300 feet wide and has an aggregate of fully 2½ miles of connected development openings, including one vertical shaft 700 feet deep. In the lower levels some very high-grade glance and other sulphide ores are commencing to make their appearance. All the ores are said to carry enough gold and silver value to cover the cost of mining and smelting. The mine is so situated that it can he opened at the surface and worked as a quarry to a considerahle depth, which will admit of the mineral heing delivered at the smelter at a small cost.

The smelter is situated in the valley 2000 feet vertically helow the mine and on the southwest side of the Mackay townsite. The ore will he delivered at the smelter over an electric switch-hack tramway 10 miles long, to he supplied with power from the smelter plant, where five 100 H. P. hoilers have already heen installed for that purpose. The grade for the tramway has already heen completed, track laying is now progressing and it is anticipated that the whole plant will he put in commission hy April.

From Mackay a first-class stage road follows up the valley of Big Lost river, over a low grassy divide at Willow creek and strikes the Salmon river at Challis, 50 miles distant. At Challis, which is the county seat of Custer county and an excellent outfitting point, the traveler may take his choice of several well-estahlished roads and trails to Thunder mountain, hut for the henefit of those intending to visit the new district early in the spring and wanting to avoid the inconvenience and dangers of deep snow, we will first describe the Singiser route, which will he the earliest to open.

Thirty miles northwest of Challis over a good wagon road, with easy grades, we cross the Salmon River range through the Morgan Creek pass at an altitude of 7500 feet. This is the only snowy stretch on the whole road and its extent does not exceed 6 miles in length, all the way through dense pine timher with no hald sidehills or danger from snowslides. Beyond the pass the wagon road extends hy easy grades down Panther creek to Prairie hasin, 10 miles. Thence over a low grassy divide to Silver creek and the waters of the Middle Fork of Salmon river, we land in 10 miles more at the Three Forks of Camas creek, a short distance helow Singiser, which is at present the end of the wagon road.

From Three Forks there is an excellent trail down the main Camas creek to Middle Fork of Salmon river, 16 miles; thence up Middle Fork to the mouth of Marhle creek, 25 miles; thence up Marhle creek 25 miles to the heart of the Thunner Mountain district, making the distance from Mackay hy this route to Thunder mountain 166 miles, over the easiest road that at the present time penetrates the new district. This route can he shortened 16 miles hy following an excellent trail up the west fork of Camas creek, over a summit to Warm Spring creek, which connects with the Middle Fork river trail at the mouth of Loon creek.

The last 60 or 70 miles of this route traverses a country of remarkahly varied mineral resources that should he of especial interest to the miner and prospector.

At Prairie Basin a discovery of heautiful gem opal was made a few years ago in great houlders of gray trachyte. These gems were of exceptional heauty and quality. They have heen classified as heing of the hydrophane variety and worth $10 per carat.

On Panther creek, which is the main stream of this grassy hasin, the Minert placers carry a hedrock pay streak worth $1 per cuhic yard in coarse gold, and in addition to the gold a good handful of 70% stream tin to every pan of hedrock pay gravel. With particles of porphyry matrix sticking to some of the nodules as a guide, the original vein source of this stream tin still remains to he discovered.

Fifteen miles northeast of Prairie hasin, near the headwaters of Copper creek and Deep creek, an area several miles in extent is occupied hy beds and dikes of rhyolites, trachytes and hreccias, from which some good gold assays can he ohtained, and where specimen gold float of fahulous richness has heen found.

Northwest of Prairie hasin 12 miles the Yellow Jacket mine, carrying a 40-foot vein of $5 free gold ore, is equipped with a 60-stamp mill, and within a mile of the mill some copper-gold deposits are heing opened up. The principal copper showings are the New Columhia, which has a large vein of rich copper, gold and silver-hearing ore in a contact with shattered quartzose schist and a dike of diorite. This vein is soon to he tapped at considerahle depth hy a 1500-foot crosscut tunnel, which has already advanced 1300 feet. Adjoining the ahove property the Steen mine, 1000 feet down the mountain, is developed to a depth of 150 feet, and shows a stockwork 100 feet wide of copper-iron sulphide hands that carry an average value of 3% copper and $3 gold, including some pay veins of very much higher grade mineral.

Immediately southeast of Prairie hasin the Silver Creek–Singiser district, which is quite extensive, is occupied almost exclusively hy light-colored igneous rock and hreccias, principally of rhyolite varieties, and very much resemhle Thunder mountain.

The placer gold found on Silver creek is only worth $12 per ounce, in contrast with the $18 dust of Panther creek, 2 miles distant. The principal source of this low-grade gold is at the Ramey mine, near the head of Silver creek.

The Ramey group covers a dike of mottled rhyolite porphyry 200 feet wide, carrying talcy shear lines very rich in gold, associated with specks of silver sulphurets. The whole width is said to carry paying values that would yield a good profit hy cyanide treatment.

At Singiser the True Blue mine has heen developed hy an incline shaft 250 feet deep and 2000 feet of levels. This is a vein of quartz and porphyry hreccia 30 feet wide hetween walls of white rhyolite hreccia and mottled hlue pyritic porphyry, and carries an average value of $14 a ton, with a pay streak on each wall 6 inches to 6 feet wide going from $60 to

$100 per ton in a proportion of about 50% gold and 50% silver.

Placer bars rich in high-grade fine gold are found all along the trail up Middle Fork. Loon creek, with a $5,000,000 record of placer gold produced, drains a formation of pink-stained granite very much resembling that of Pike's Peak, Colo.

Passing over the trail up Marble creek, the characteristic eruptive formations of Thunder mountain commence to make their appearance a few miles above its mouth.

From Challis several other roads and trails lead to Thunder mountain. Going from Challis over the old Custer wagon road up Garden creek 10 miles, we strike a trail over a low ridge to Challis creek, where a new trail is now being cut through the Challis Creek pass to Loon creek and the Middle Fork of Salmon river. This trail will be gotten in shape for later spring travel and will make the most direct and shortest route possible from railway connection to Thunder mountain. The distance from Mackay by this way will be 140 miles, and when the railway reaches Challis, about next August, the distance will be reduced to 90 miles.

From Challis the State road follows up the main Salmon river, over which an excellent daily stage service connects via Clayton, Bayhorse and Robinson with Custer and Stanley basin. At the latter place it connects with the Ketchum-Thunder Mountain road. And from Custer, Clayton and Bayhorse good trails can be found passing directly over the Salmon River mountains to the Middle Fork trail.

At Bayhorse the Ram's Horn mine, which is opened on a true fissure vein in metamorphic slate and greenstone, has 10 miles of connected open development, including one adit tunnel, driven on the vein for 3000 feet, that has gained a face depth of 2000 feet. This mine carries gray copper ore in a gangue of high-grade iron carbonate. It has a bullion record of over $2,000,000 and is claimed to have over $2,000,000 worth of measurable ore blocked out at the present time. This mine shipped two twenty-ton cars of ore last summer from development work that samples 900 ounces in silver and 30% copper per ton.

Adjoining the Ram's Horn on a parallel vein, the Sky Lark mine has over 30,000 feet of development and a bullion record of $2,800,000. This mine has been continuously operated for the past twenty years and shipped 500 tons of high-grade ore last summer. Ten miles south of these mines, from the same formations and character of ore, the Poverty Flat group of mines have produced $700,000 from a vertical depth of less than 200 feet.

The Custer district is one of the most remarkable volcano centers in the West. It consists of at least a dozen volcanic peaks fully 10,000 feet high, composed of syenite, diorite, porphyry, andesite, rhyolite and basalt. This district is fully 15 miles square and is surrounded entirely by a granite country. It has two distinct systems of fissure veins that have made an aggregate production in gold and silver of $12,000,000, the bulk of which being derived from the Custer-Lucky Boy group.

The Lucky Boy mine is being very successfully operated at the present time with a force of 75 men and a 25-stamp mill. There are also several other properties that are being quite actively developed in this district at this time. The value of the ores of the Custer district are about equally divided between gold and silver and have shown some high values.

South of Custer 16 miles, the Stanley Basin district offers a very inviting field for the prospector. This is an old placer district with a production of over $1,000,000. The formation is soft crumbly granite, and the basin is ribbed with parallel dikes of quartz porphyry and trachyte, associated with veins of curly agaty quartz, intermixed with a good deal of fluorspar.

Some of the placer gulches were worked right up to and into these big dikes, and the original source of the gold was found lining the shrinkage and structure planes of the porphyry. It is associated with brown oxide cubes after iron pyrites and produces some very handsome specimens.

Some of these dikes carry live iron pyrites that do not show a color of free gold by panning, but assay several ounces of gold to the ton. The combination of conditions at this district resemble Cripple Creek in some respects, and may result in the discovery of rich tellurium compounds.

Such are a few of the principal mineral features of the country approaching Thunder mountain via Mackay and Challis, and associated with them are hundreds of fine prospects and hundreds of square miles of practically unexplored country, whose varied conditions offer close comparisons with some of the most famous mining districts of the world, and exceptional chances for the discovery and development of rich mines.

SEVERAL processes for the production of silicides in the electric furnace have lately been discovered. A new use for these compounds has been proposed, founded on their decomposition, when cold, by water. They are formed by the reduction with carbon in the furnace of any salt of the alkaline earths with quartz or sand, and, being very fusible, readily flow out from the mass. They are not new compounds, magnesium and calcium silicides having been discovered in the middle of the last century. But it is stated that the $CaSi_2$, $BaSi_2$ and $SrSi_2$ prepared as above yield, with water, a copious and cheap supply of hydrogen, leaving hydronides of the alkaline earths, which are of commercial use. The freedom of the hydrogen, so prepared, from impurities makes the process of considerable commercial importance.

The Edges of Drill Bits.

TO THE EDITOR:—There are two kinds of bits for hand drills (in mining) in vogue, viz: The "square" and the "round" bit. As Fig. 1 shows, the cutting

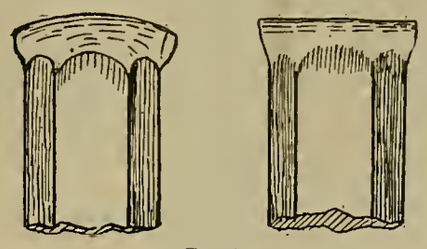


FIG. 1.

edge of the square bit is a straight line, that of the round bit the segment of a circle.

Everything else, such as bevel, quality of steel, temper, etc., being equal, which bit will cut the fastest in any kind of rock with the same work with the hammer?

Everything again being equal, will one bit stand more punishment, particularly referring to the corners, than the other, and, if either, which one and why?

In dressing the tool some blacksmiths draw the corners of the bit with the side of the drill-sharpening hammer and then hammer the steel back with face. Others "squeeze" the corners out with the face of the hammer and then dress it back into shape with the side of the hammer. Does either method possess a superior merit in regard to the lasting quality of the drill bit, and, if so, why?

Octave, Ariz., Jan. 17. C. P. SCHACHMAN.

[The surest way of obtaining an indisputable answer to the first query is to make two drills, one with the straight bit and the other with the round, and try them under the same conditions for speed of cutting. Without doing it, and without ever having done it, the writer's opinion is that the round bit will cut the fastest. The straight-edge bit will wear on the corners, round and dull at the same time, and will diminish the bore of the hole more rapidly than the round-edged bit. It will have a tendency to fitcher, which will make its speed of cutting uncertain. Generally the round-edged bit should cut faster, because it will cut more.

The round-edged drill will stand the most punishment. In Fig. 2 is a sketch of the bottom of a drill

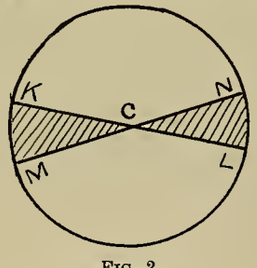

FIG. 2.

hole. The drill, in cutting, is turned after each blow of the hammer, so that the edge of the bit by the next blow is driven into the rock in a line, making a more or less acute angle with the line of the preceding blow. The effect is to split off the two rock chips filling the two acute angles. Referring to Fig. 2, the first cut of the bit being in the line K–L, and the second cut being in the line M–N, the effect is to cut out the two rock chips in the angles K–C–M and L–C–N. It will be noted that these two lines of cut cross in the center, C, and that all the successive cut lines must pass through the common point, C. With a straight-edge bit it is clear that the load of the work on the cutting edge would be unequally distributed, the center having the least load of work, since it is all on one point and the load of work increasing from the center out to the corners, as the distance increases the width of the angle of the chip. The heaviest load of work is on the corners, where the width of the chip is greatest and where it is joined to rock on the side of the hole, making its resistance to chipping greatest. The constant tendency would be, therefore, to make the center cut go ahead of the circumference cut. The whole force of a blow of the hammer, then, comes on the corners, instead of being distributed equally along the whole cutting edge. The drill may then break on the corners, or, if it misses that, it wears down rapidly on the corners and has to be retired. The round-edge bit is the fitting of the tool to meet the condition of its use. The bearing of the bit at the instant of striking the hammer blow is put on or near its center. The full force of the blow is more evenly distributed along the entire edge of the bit. It might seem that the result of successive blows would bring the curved edge in the same relation to the bottom of the drill hole as described for the straight-edge bit. This is not, however, the fact. The cutting force at the edge of the curved bit takes a direction radial to the curve of the edge, instead of being direct in the line of the blow. More of the effect of the blow is thus taken up by the rock toward the periphery of the drill hole.

To be exact, the corners of the round-edged bit do not stand more punishment than the corners of the straight-edge bit. They simply have less work thrown on them, and so last longer.

As to third question, the writer does not see a conclusive answer as to the preferable practice. It would seem to be a matter of the personal equation. The first-described method would possibly have a slight advantage over the second, in that the fiber of the metal is laid when it is hottest—at the beginning of the working. The steel crystals are not so readily elongated in direction perpendicular to the cutting edge by hammer-face blows as by the "squeezing" effect of the drawing blows of the side of the tool. What is here written is intended as suggestive, rather than conclusive. It is one of the problems of practical mining which in the end must be worked out by practical doing. It can not be settled by the most refined analysis by the pen of a writer. The limitation of the latter is the expression of the meaning of the results of many trials.—ED.]

Nitrate Deposits, Humboldt County, Nev.

Written for the MINING AND SCIENTIFIC PRESS by THEO. H. VAN WAGENEN, E. M.

There is plenty of low-grade nitre rock in the lower valley of the Humboldt, not far distant from Lovelock, Humboldt county, Nev. The region has, at some time in the distant past, been the seat of numerous hot springs rich in minerals. These springs lie along a line extending in a general north and south direction, upon the east side of the valley, and probably issued from a fault fissure having a length of 25 miles or more. Most of the cones built up by these springs have been buried since their extinction under the enormous amount of alluvium which the river has brought down during recent geological time, and which makes its broad valley at the present such a fine agricultural region; but a few are still partly or wholly exposed. In addition to the sodium and potassium nitrates which the material in and around these dead springs affords, analysis shows the presence in greater or less quantity of sulphur, salt, iodine, bromine, copper, gold and silver. Some who have given the region study believe that much of the stuff that is exposed in the shape of cones, cliffs and dust beds, can be successfully worked for their precious metal contents, as well as for the numerous other valuable substances they contain.

At the foot of Humboldt Sink these minerals (mainly sodium nitrate) have been found in considerable quantity in and around an extinct hot spring that at some time must have been of huge dimensions. Some Lovelock people have located and patented 320 acres of this deposit, and have bonded it to a Detroit, Mich., company, who are preparing to explore and exploit it thoroughly. Work will begin upon it early in the spring. The people interested are making no large claims as to the value of the stuff, and in fact make no claim at all, being as yet quite uncertain whether it can be handled and treated at a profit. They propose to give it a careful and thorough trial this spring, by endeavoring to develop a quantity of material of sufficiently high grade in the nitrates to permit of its being worked at least for its nitric acid contents; and if it appears that the rock can be successfully leached, and the desirable chemicals economically crystallized from it, large works will be erected before the end of the current year.

CONGRESSMAN CUSHMAN of Washington has introduced a bill providing "that hereafter all locations of placer mining claims in the district of Alaska shall be made in person by the claimant, and hereafter all locations of placer mining claims in the district of Alaska by agent or representative or under and by virtue of power of attorney shall be void."

Compressed Air for Operating Pumps.

Aside from the simple Pohle air lift, there are six other systems for raising water in which compressed air is used as the working medium:

1. Displacement pumps—full pressure.
2. Displacement pumps—expansion.
3. Direct-acting pumps—full pressure.
4. Direct-acting pumps—expansion.
5. Air lift pump—combined with displacement pump.
6. Pumps operated by air motors.

The simplest of these is the displacement pump for direct and full pressure. In certain industries acids and commercial liquids have been transferred for some time by air pressure acting on the surface of the liquid-confined tank, and strainers and agitators are often used in the same way.

The principle has been extended more recently to a form of displacement pump for raising and forcing water from a distance when the source is a pond, dug well, river or other surface supply. The same apparatus in a slightly modified form is also used to raise acids and heavy chemical solutions or to lift sewage to a higher level; for pumping marl, paints and other semi-liquids.

In its simplest form the device consists of two chambers of a material unaffected by the liquid to be handled and submerged in the liquid. The chambers fill alternately through openings in their bases and the material is forced out through a common discharge by direct air pressure, acting without the friction, leakage and wear incidental to friction pumps. The valve for alternately filling and emptying the chambers is above the liquid surface and where it can not be affected by direct contact or by any fumes or corrosive gases given off.

The height to which water can be raised by this means is limited only by the pressure of the air used to operate the pump, and the quantity raised will in a like manner depend upon the volume of air forced into the chamber per minute. These pumps are built in sizes up to 1500 gallons per minute for all varieties of service, such as draining sumps or dips, for which purpose they are unsurpassed, because of their automatic starting and stopping—according to the presence or absence of water. They use air only in proportion to the accumulation of water.

They form a very reliable pump, use no oil or packing, are unaffected by grit and repairs are insignificant, there being practically no repair or maintenance expense when once they are installed and adjusted.

The system lends itself most satisfactorily to small municipal water works and effects noticeable economy, the water being supplied to the pump cistern from wells by the air lift, using the same plant for the two purposes. All other pumps are thus done with, no standpipe is required, the steady, elastic air pressure forcing the imprisoned water into the service mains in a continuous stream. The whole system is efficient, simple, self-contained and economical in first cost and cost of operation.

With air at ninety pounds pressure per square inch, allowing for pipe friction, air absorbed by the water and a small addition necessary to cause the flow, it is safe to assume 9 cubic feet of free air for each cubic foot of water pumped to an elevation of about 210 feet, as approximately stated.

With the displacement pump 1 cubic foot of free air at ninety pounds pressure will do 175 foot-gallons of work.

The efficiency of this system, employing only ordinary single stage air compressors and lifts not exceeding 250 feet is greater than that obtained with the usual direct-acting single cylinder pump using air instead of steam.

If compound compression or two or more stage compression is used, better results may be expected, especially if the water pumped is warmer than the air arriving at the pump. Generally speaking, the efficiency in this case may be taken as between 15% and 22%.

Compressed air can also be used to operate steam piston pumps, and when these are located outdoors some distance away from the boilers it will run them with greater economy than can be done with steam, because of the rapid condensation of steam in the exposed pipes leading the steam to the pumps. Authorities estimate that with coal at $2 per ton every foot of uncovered 2-inch pipe costs by condensation about $1 per year, and even with covered pipes, when long, the condensation is a considerable factor.

In addition there are no hot pipes, becoming leaky through alternate contraction and expansion. There is no exhaust to dispose of, the pumps take less oil, are more reliable and last longer.

Even under favorable conditions a steam pump is not an economical machine, and the simple direct-acting form is known as the least efficient of all steam users, and hence air users, as a result of the large clearance space and the impossibility of obtaining a full stroke, besides the considerable condensation which unavoidably occurs.

The average mechanical efficiency of the pump alone will be about 65%, although in many cases 50% is nearer the mark. The total over all efficiency, from steam used to water raised, will average nearer 12% to 20% in most plants, as actually operated.

By means of compounding and reheating or interheating the air, better results are obtained, the average running up from 15% to 30%. Experience has shown that, for average conditions, using air at ninety pounds pressure per square inch, 1 cubic foot of free air will do approximately 135 foot-gallons of work.

On the basis 111 cubic feet of free air will be required to raise 150 gallons 100 feet high per minute, and assuming 20 delivered H. P. necessary to compress 100 cubic feet of free air per minute, we have 1.1×20, or 22 H. P.

In the case of pumps working either under full pressure for the full stroke, or expansively, there is a liability to "freezing up" in the exhaust passages and ports or at the exhaust, an annoying and sometimes serious matter. Two general ways to avoid this are adopted—one to spray a small jet of water taken from the pump discharge directly into the exhaust of the air cylinder, a rough and ready means, but one that works well.

The second and best method is to use compound pumps which permit the introduction of an air heater between the cylinders, besides having a higher mechanical efficiency of 70%.

This interheater is a copper coil immersed in a tank of running mine water. Or it may be a regular feed water heater put to this use. The exhaust air, usually much colder than the mine water, absorbs sufficient heat from it to allow a second expansion in the low-pressure cylinder without carrying the exhaust temperature below the freezing point.

The average total efficiency to be expected with this arrangement is about 33%, while if in addition the air is obtained from a compound compressor the efficiency may reach 38%.

For purposes of comparison we may assume that: One cubic foot of free air compressed to ninety pounds per square inch will do 232 foot-gallons of work.

The application of reheating and other methods of increasing the efficiency of pumping or air-driven power outfits depends to a considerable extent upon local conditions.—Compressed Air.

Oro Grande, Wickenburg, Ariz., Mines.

[STAFF CORRESPONDENCE.]

The property of the Oro Grande M. Co. comprises a group of nine claims near the Hassayampa, 5 miles northeast from Wickenburg, Ariz. The outcropping here shows a main ledge running northeasterly and southwesterly through a diorite formation, and traceable about 4000 feet. Development aggregates about 1500 feet, there being a 300-foot shaft, with 500 feet of drifting on the 100-foot level, next to the east wall. Several crosscuts from this drift westward shows the ledge to be 75 to 130 feet wide. On the 200-foot level is 150 feet of drifting with a 100-foot crosscut from wall to wall. There is similar work on the 300 level. The ledge matter is talcose, carrying iron oxide stringers. The values, consisting of free gold, are carried in both the talc and iron. The vein also contains bunches and horses of diorite, which are not mineralized. There are also stringers of quartz and calcite spar which carry values. Eight samples of this ore show an average of $70 gold to the ton of ore. A parallel vein, included in this group, also shows up well in the outcropping and in surface workings. The property is under the management of Geo. B. Upton, with B. O. Hatfield as foreman, both being interested in the property. The shaft is equipped with a gasoline hoist.

Some development is in progress on the Sahuaro, 2 miles east of Wickenburg, native silver having been found in sinking a shaft. E. J. DeWitt is in charge for Colorado Springs parties, who have a bond on the property. The extension of this is being worked by R. G. Brown of Red Bluff, Cal.

The Keystone, which has changed hands, will soon be started up, it is claimed, by Pittsburg people. It is also stated that F. X. O'Brien's mine, 16 miles northeast of Wickenburg, has been bonded to people formerly interested in the Keystone.

The United G. & C. Extraction Co. of Cleveland, Ohio, have made a payment of $3000 on J. Ellis' Alice group, near Gilbert.

The mill of the Ardath M. Co., southeast of Wickenburg, is being put in condition to run, and is in charge of Capt. Cree.

The American G. & C. Co. have eight men at work on the Santo Domingo. Geo. W. Morgan also has a small force at work on his group near Gilbert.

At the Vulture mine cyanide work on mill tailings is going on and a crosscut is being run at the 200-foot level in the new shaft. Geo. W. Sanders is Supt.

A 200-foot shaft is being sunk on the Angell copper group near the Vulture. This mine has been sold to the Idaho Con. C. Co.

A 20-stamp mill is being put up on the Socorro mine, 40 miles west of Wickenburg, in the Harqua Halas. Jno. Witherly is Supt. The ore is suited to concentration.

Wickenburg, Jan. 17.

Washington Camp, Arizona.*

[STAFF CORRESPONDENCE.]

In Washington camp, Santa Cruz county, Ariz., the ore bodies are found in a lime belt, approximately 3000 feet wide and over 7000 feet in length. Within this belt are numerous mineralized ledges, which in the main take a northerly and southerly course. In most cases the cropping at the surface is very distinct, though in others the ore is beneath a lime capping. Some of the veins, as shown by development, are between lime walls, though the richer bodies appear to be along the borders of the lime belt, in the contact between lime and porphyry and between lime and quartzite.

The ores comprise iron, copper, zinc, lead and silver, with considerable garnet in the gangue. Near the surface the vein matter is oxidized, merging into the sulphides at varying depths. The oxidized ores are rich in copper, silver and lead, the zinc and iron being found mostly in the copper sulphides. The original workings in this camp, which date back to the '60s, were for the silver only and work apparently ceased on reaching the chalcopyrite. It is estimated that the sulphide ores of the camp will run 20% zinc, 7% copper, 10% lead, 30% iron and 10 to 30 ounces silver. These conclusions are reached as the result of sampling, mill work and smelter shipments from a great many open cuts, shafts, tunnels and winzes on different properties of the district. The principal holdings of the camp are included in four groups—the Duquesne, belonging chiefly to G. Westinghouse; Pride of the West, whose stockholders are principally Colorado men; the Poole group, being developed under the direction of E. M. Ray; the Copper Century, owned by Boston parties and managed by G. A. Lonsberry.

The Duquesne has a plant of hoisting machinery, a 640-foot shaft and a considerable amount of underground work, as well as good buildings. No work is in progress at present, though the owner is represented here by J. F. Tenner.

The Pride of the West, adjoining the Duquesne on the north and west, is well developed through tunnels and shafts, disclosing a vein from 8 to 30 feet wide, carrying the typical copper-zinc-iron-lead sulphides of the camp. The property includes a concentrating mill and smelter, both of which are being remodeled and enlarged. The mill, when newly equipped, will contain two crushers, five sets rolls, four magnetic separators, nine Wilfley tables and a roasting furnace. The plan is to convey the ore from the rolls to the roaster, subjecting it to moderate heat to magnetize the chalcopyrite before passing the material through the magnetic separators, which part it from the other constituents. The smelter will produce a matte. E. Gee is manager of this property.

The Copper Century group covers about 250 acres and adjoins both the Duquesne and Pride of the West. It includes the Belmont property, in the old workings of which are exposed great bodies of copper carbonates near the surface and chalcopyrite at greater depth. This belongs to San Francisco parties, but is bonded to Mr. Lonsberry and associates. There are other outcropping ledges covered by the Copper Century group, on which surface workings go into a good grade of the characteristic ore of the camp. Tunnels are being driven and two gasoline hoisting plants are being put up where shafts have been started. All work observed is in ore.

This camp is 20 miles from the railroad, being equi-distant from Patagonia and Nogales. The hills of the district are covered with a fair growth of scrub-oak timber, making fuel plentiful.

Washington, Jan. 15.

*See illustration on first page.

Behavior of Iron When Magnetized.

TO THE EDITOR:—In the last issue of your valuable paper there appeared a "Concentrate" with regard to the behavior of iron when magnetized. Some appeared to doubt the mere statement and I thought it might be of interest to confirm the statement.

According to the "Concentrate," "a bar of iron increases in length when first magnetized, but upon increase of the magnetizing force the effect is reversed and the bar shortened."

First consider the molecular condition of an unmagnetized piece of soft iron. Each molecule is supposed to have an equal north and south pole, but the magnetic force lines of these poles are neutralized by the surrounding poles in adjacent molecules.

Under the action of a small magnetizing force, such as a slight electric current through a coil of wire around the bar, the molecules are pulled so that the north poles are faced toward one end of the bar and the south pole toward the other end of the bar. This pulling force being small may not move all the molecules, but such movement will slightly lengthen the bar.

But if a stronger current be sent through the bar coil the bar will first lengthen and then quickly contract, because of the attraction exerted between positive and negative poles, which attraction is enabled to act when the magnetizing force is strong enough. T. S. J.

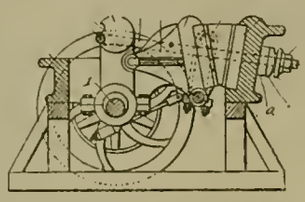
Denver, Colo., Jan. 20.

Mining and Metallurgical Patents.

Patents Issued January 21, 1902.

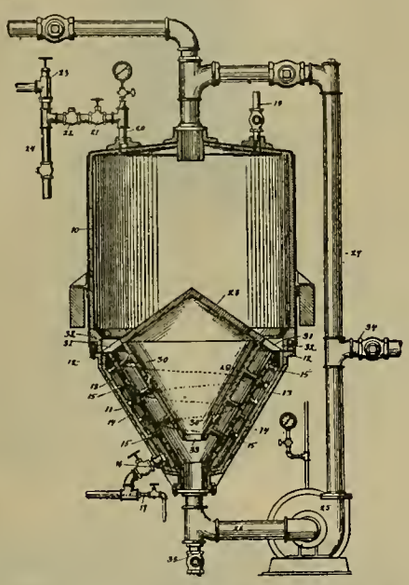
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CRUSHING MACHINE.—No. 691,593; M. G. Bunnell, Chicago, Ill.



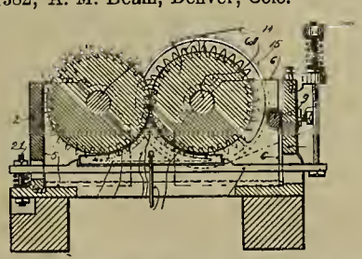
A rotary driving shaft provided with an eccentric; a pitman arranged upon and extending upwardly from eccentric, and actuated thereby; a vibratory crushing jaw arranged forward of pitman and supported by swinging links pivotally connected at their lower ends with lower portion of movable crushing jaw, and having their upper ends pivotally supported upon body frame of machine; a stationary crushing jaw arranged opposite to and forward of movable crushing jaw and backed by forward stationary part of body frame of machine; a couple of vibratory tension rods arranged as connections between pitman and stationary part of body frame and connected with latter to swing about an axis forward of movable jaw; means for adjusting length of each rod between the axis and connection of rod with pitman; means for permitting connection between vibratory tension rods and pitman to be adjusted toward and away from axis of driving shaft; and a power-transmitting arm arranged between movable jaw and pitman and connecting with latter at a point between axis of driving shaft and point of connection between tension rods and pitman.

METALLURGICAL FILTER.—No. 691,706; F. H. Long, Chicago, Ill.



A vessel having a conical filter septum and an outlet port for filtrate beyond such septum, means for establishing an end-to-end circulation of vessel contents above septum, a conical spreader and an oppositely facing conical baffle plate having a projecting spiral flange successively interposed between ends of vessel and arranged adjacent conical filter septum to intimately direct such circulation over its surface.

ORE CRUSHING AND PULVERIZING MACHINERY.—No. 691,582; A. M. Beam, Denver, Colo.

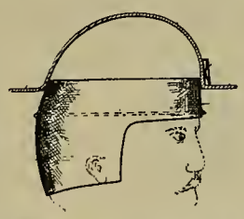


Supporting base, fixed shaft on base, a movable shaft mounted on base, rock and ore crushing rolls operated on shafts in alignment with one another and in rolling relation to one another; an adjustable, resilient buffer arranged to hold one roll in a predetermined, yielding and resilient relation to other roll, with a grinding block arranged to extend between rolls and engage their peripheral surfaces; supporting bar; spring between one end of bar and base, an adjustable bolt passing through spring and arranged to secure bar to base, a removable bracket secured to base, a vertical adjusting rod extending from free end of support through bracket, a spring around rod and resting in bracket, and a wrench nut threaded on rod and arranged to bear on spring.

ROCK DRILL.—No. 691,556; H. Leineweber, Chicago, Ill.

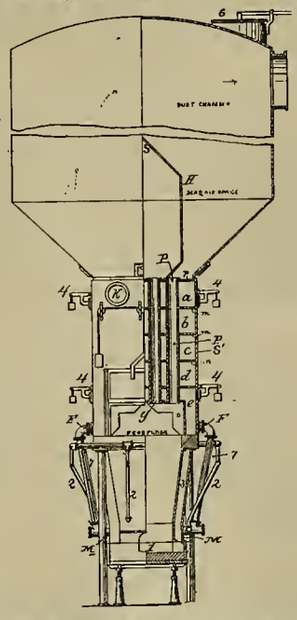
A support of a drill holding shaft, a fluid pressure actuated drill hammering device on forward end of shaft, a casing on opposite end portion of shaft slidingly mounted on support, a fluid pressure actuated shaft turning rotary motor in casing, a feed screw upon shaft, a friction clutch between shaft and feed screw, and an adjustable feed screw engaging and releasing sectional nut on support for advancing rotating feed screw and shaft.

MINER'S HAT.—No. 691,623; A. Harris, Calumet, Mich.



A depending flap of rubber or other material, a supplemental flap of soft rubber and an encircling wire band arranged at juncture of main and supplemental flaps.

COPPER SMELTING FURNACE. — No. 691,648; G. Mitchell, Los Angeles, Cal.



The crucible, a feed floor, and a metal chamber or section located above feed floor of furnace, a series of transversely arranged partitions forming a zigzag or serpentine passage for air blast, an air blast inlet communicating with upper end of such air passage, air pipes communicating at one end with lower portion of air passage or chamber, and their opposite ends with a series of tuyeres, and a series of vertical flues extending from furnace upwardly through partitions and air chambers or passages.

Workings of a Manager's Mind.

Written for the MINING AND SCIENTIFIC PRESS by CHARLES H. FITCH.

I knew a man who graduated as an engineer, but never became an engineer in any real sense. Some one may say that his name is legion, but I speak of only one. He was a conscientious worker. He got good marks as a student of lessons. He was put into a first-class shop, and did a series of mechanical tasks, but he said of himself: "I stuck too close to my work to learn much." It was a good hoisting engineer who wrote the words: "Unless above himself he elevate himself, how poor a thing is man." To be an accomplished manager, a man has got to get out of himself and his limited practice and go far afield for other experiences, and bring them back and look at his own old practice in the light of them. The story is told of a colliery boy who was taken by his father to the city of Glasgow. As the train rolled in through the lighted streets in the evening he exclaimed in new delight: "Father, this is a bigger mine than ours." That is as far as the story went in my reading. The point of humor was satisfied—that lad had called a city a mine. Now, calling a thing does not make it. That point was emphasized by Lincoln to the divines who called upon him to urge an impracticable emancipation of the slaves. He said: "How many legs has a sheep, calling the tail a leg?" They all chorused, "Five," but he said: "No; calling the tail a leg does not make it one." In this anecdote we have the great sweeping division between two schools of philosophy, the nominalists and the realists. The book man goes by names, and the first thing he knows he is dealing with empty names which have no things to "make good." But the colliery boy had come to a new thing, which not only filled the lines of the old name, but "burst its seams." It was a city. Chicago is symbolized by a Y on a terra cotta ground. The Y indicates the branching of the Chicago river. If we compare any two such things as a city and a mine, we must note that they have elements in common. But on some points they branch apart and are distinctively different. And to every idea connected with the bifurcated subject we bring the test of likeness or difference. Better still, we put pressure upon these ideas and consider the effect of forcing likenesses where they do not exist, and making differences where they do not exist, and some of the results are absurd. Looking at the absurdity very closely, however, we are likely to find in it some new utility which can be separated as a discovery, like a new element discovered from the inconsistent behavior of what was supposed to have been an old one.

California has supplied to the world a significant number of managers of the very largest foreign mining works. They have been called in preference to English engineers of excellent experience and German engineers of close (too close) scientific attainments, because they have the rather American habit of getting out of the ruts, and applying in one place ideas gathered from another place.

There exists a sort of dumb, hazy feeling that our own colleges and laboratories ought to teach the student what he requires—that he ought to get at Berkeley, or Columbia, or Hougbton, what he often goes to Heidelburg or Clausthal to obtain. Millionaire after millionaire comes to the fore with princely endowments, but what is wealth without idea? The agents of these wealthy purveyors of education seem to have but one idea, which they take turns using like a family toothbrush, and they all come out on that same model, like peas in a pod. We may inflate this one idea until it bursts, but it will never supply a liberal education. We might, it is true, study to provide different methods, antithetic schools side by side to sharpen sense and awaken the torpid univalve mind, but we don't, because the university regents are cyclopean of vision, and no person of wealth has had the wit to found a diversity.

The functions of a manager are considered somewhat diffuse. The assayer does something definite, and the surveyor does something definite, but the manager gets a big salary for looking on. It strikes people like it did the Arab who saw Theodore Thomas leading an orchestra. The son of the desert was most amused by the musician who performed with a stick upon an invisible instrument. What is the trick of the salary-getting American managing engineer? What is his process? There is no use in describing him as ambitious and enterprising—glib words used without analysis. Be thou likewise capable. Why, multitudes are wishing to be capable, and making no progress as they stand before that unsolved word.

Perhaps the habit is one of constructing in thought systems of comparison which less favorably equipped

men construct more slowly in fact, and arriving at swift practical judgments. The process is like the following. It requires both theory and practice.

Given all the elements of a problem solved in a known way. Ask what will be the effect of constructing a similar system of different elements. In what respects are the new elements like the old? So far the effects will be similar. In what respects are the new elements different from the old? So far the effects will be different. The situation may be new, but if it be filled out with familiar elements we know about what shape it will take.

Thus we are led to assume that we will get certain results dealing with partly new elements. This is theory. We try it, and find almost invariably that our theory is at fault. This is practice. It is necessary that we should show daring in our theory, and it is necessary that we should find it at fault if we are to learn anything or enlarge our destiny in any way.

Reams of articles have been written, and will continue to be written, setting theory and practice by the ears, and declaiming against one or the other. They are, however, parts of one process, that of constructing systems which by likeness and difference give us a store of useful comparisons. When we antagonize them it is like saying that one part of the experiment is right, but that the other should be omitted. Both are necessary. Both may be performed by one man, but in the past, in a flow of ideas which seems to have been "as slow as molasses," one man has "nobly begun" and suffered for it in one country, and it is reserved for another, ages later and perhaps of a different language and nation, to continue the work.

Bring together these remote but complementary movements of the mind, let their long-drawn, straggling course be gathered in the intellectual grasp of a single person, and we have a manager worthy of of the name, even though, like the leader of the orchestra, he appears to play upon an invisible instrument.

A New Mexican Mining District.

Written for the MINING AND SCIENTIFIC PRESS by E. B. VAN OSDEL.

No one who has traveled over the Mexican Central Railroad through the northern and western parts of the Republic can have failed to notice the lack of prominent peaks or lofty ranges. The mountains seem to be distributed along the plain in small groups here and there and are soon run down traveling by rail. With a few exceptions, such is the case along the same line in the State of Jalisco. Leaving Guadalajara, we are carried almost due west in general direction to the junction La Vega; thence a branch runs north and west for a score of miles, climbs over a range of hills and is at once in a most beautiful basin surrounding Magdalana lake, skirted by hills rich in the metals and filled with large haciendas and fertile ranches. On the southern side of the lake and on the foot of the adjacent hill is the town of Etzatlan, whose municipal records begin in 1521.

For the past two months the writer has been stationed in this town of 7000, in connection with a smelting plant and mining interests. The Spaniards and Mexicans have gophered about the hills for hundred of years and their prospect holes and dumps are everywhere on the slopes. The mining resources of the country are thus opened up to a certain extent, so that American capital, which is rapidly coming in, may get some idea of the wealth to be found here.

Sixty miles north of Etzatlan is the barranca of the Rio Grande de Santiago, with the town of Hostotipaquillo lying half way between. From Hostotipaquillo to the river is a district abounding in old silver mines which have been worked on a considerable scale. The veins are hundreds of feet in width, containing enormous quantities of medium-grade ore with stringers of a high grade. These mines have enormous dumps of low-grade sortings running from five to fifteen ounces in silver per ton. The ores are mostly siliceous, carrying some manganese, while galena, chalcopyrite and hematite are found in some.

South of an east and west line through Etzatlan is a range of hills filled with silver, copper and lead ores, but with considerable zinc associated with many of them. Some gold is found in the district. Feldspars abound in the region, while great porphyry dikes and beds of blue conglomerate with flinty dolerites are to be found in extensive masses. The ores are found mostly in feldspar, with some quartz. Silver, as chloride, bromide, sulphide and in the native wire forms, is abundant in the pure state. Galenite, cerrusite, bornite, chalcocite, chalcopyrite, sphalerite and native copper are found in large quantities. There are also large deposits of hematite and calcite suitable for flux. For treatment there are many amalgamation arrastras, a few stamp mills, also cyanide and hyposulphite leaching plants; but the common and characteristic mode of treatment is the patio process.

About 5 miles from Etzatlan in a southerly direction is the Santo Domingo mine. It has been worked for hundreds of years and is now in operation by the Compania Armonia. The rich ore from the mine is sent to smelters, while the medium grade is treated by the patio process in a mill situated half a mile up the nearest gulch from the mine.

There are three of the picturesque old Mexican structures near Etzatlan. Two are at the edge of town and are not in operation. The grounds are laid out as a park, with walks set in patterns of difierent colored stones, with drives and permanently constructed waterways. There are also several fragmentary structures for carrying on the process, using arrastras turned by mules for grinding, and the settling being done by boys performing a stationary run in the tank of mud. The Santo Domingo mill is situated in a large, level plat in the gulch, the grounds being walled in with the building in the central part.

Stalls and a yard for the mules occupy the upper end, while the patio, settlers and conceutrators occupy the lower end. In the building we find a disintegrating overshot wheel of huge dimensions and a group of large arrastras. Lately two boilers, an engine, crusher, quartz mill and feeder, also two Bartlett tables, have been installed. An office and storeroom are in close proximity and a large gateway and bridge lead over the creek. On the lower side of the main building are settling tanks, assay furnace, storerooms, hand concentrators and quicksilver settlers, which are turned by mules, grouped around the patio.

Only a limited amount of ore can be packed down by the mules from the mine, so that running is intermittent. The crushing is done by a Dodge crusher and Byan roller quartz mill, furnishing a 20-mesh product, which is carried out by a stream of water and settled in a series of three tanks. Forty tons of the remaining mud are shoveled out into a large pancake, called a torta, and a hot solution containing 150 kilos of blue vitriol and 2000 kilos of salt added, and about 350 kilos of mercury. The torta is mixed for seven days six hours a day by twenty mules, with the addition from time to time of more mercury in 30 kilo lots, until a batea test shows free mercury. Usually 500 kilos of mercury are required. When the torta is done it is shoveled into the settlers, to remove the mercury, and the tailings are settled in a tank to await concentration. The silver recovery in this way is 85% and the cost is between $7 and $8 per ton (Mexican money). With the old arrastra for grinding the cost was $11 per ton.

The ore carries 12 to 15 grammes in gold and about 920 grammes in silver per metric ton. The concentrates (4%) give 120 grammes gold and 2200 grammes silver.

The cost of treatment is distributed about as follows:

20 mules for 7 days	$25 00
4 men on torta for 7 days	10 10
Helpers	7 00
Mechanical loss of mercury	20 00
Chemical loss of mercury	33 00
Salt, 2 tons @ $35 ₱ ton	70 00
Blue vitriol, 150 kilos @ 8c	12 00
Total cost for a torta of 40 tons	$177 10
Cost per ton	$4 43
Cost of milling per ton	2 20
Administration	1 00
Total cost per ton (Mexican money)	$7 63
Total cost per ton (American money)	$3 75

As soon as the two Bartlett tables are in operation a much better grade of concentrates will be secured. Regardless of the latter, the margin over the patio treatment is more than $20 (Mexican).

WHEN a man has accomplished something of importance by dint of hard work and much experimenting there are always people who bob up and claim priority of invention. If an idea passes through a man's head that so and so might be done, and several years afterwards another man comes along and actually accomplishes what the first man dreamed might be done, the first man immediately claims that he was the originator of the idea. This is absurd. Credit should be given the man who not only thinks of an idea, but who carries it out to a practical end. The world is too full of dreamers.

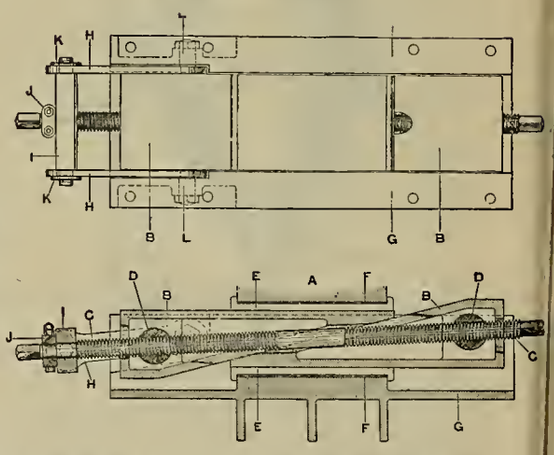
A LIQUID that will not freeze at a temperature of 205° below zero is said to have been discovered by Dr. Arsene d'Arsonval of the French Academy of Sciences. The liquid is extracted from ordinary petroleum. It is a "petroleum ether," and its temperature of freezing is lower than liquid air. The inventor says it is destined to be of considerable value to scientists, especially in chemical research, permitting the construction of thermometers of great range and precision.

PETROLEUM, it is claimed, can be deprived of its odor by adding to it about 2% of chlorite of lime, and stirring thoroughly for a long time. The mass is then stirred up with unslacked lime and allowed to stand. The petroleum will then have no offensive odor and can be decanted off from the calcareous sediment.

The American Steam Stamp.

It is not to be expected that a small simple engine will realize the same economy of steam as can be obtained in a 2000 H. P. steam plant with triple expansion engines and all the expense of details involved in a great installation. But the small engine serves an excellent purpose. It is not to be expected that a small prospecting mill costing a few hundred dollars will be as economical in power and labor costs per ton of ore crushed as an Alaska-Treadwell mill costing hundreds of thousands of dollars. The man who complained that he could get for a sixpence in his country what cost him a shilling here, was asked why he did not stay there and enjoy this economy, but explained that he had no sixpences.

If the owner of a gold mining prospect has not got the hundreds of thousands necessary for a great mining plant and development; if he cannot safely pay interest on these great sums for months and years until his mine reimburses him, he has the alternative of taking more modest steps, putting in a small reduction plant, developing his property by degrees and realizing from the mine itself to pay for its advancement to greater things. The



manufacturers say: "The American steam stamp is designed to meet the requirements of the owners of gold mining prospects and small mines. For the adjustment necessary to compensate for wear of shoes and dies this stamp employs a wedge base with right and left hand screw. This combines the power of wedge and screw, can be worked by a hand ratchet, and does not disturb the steam valve mechanism at all. For the steam valve this type of mill is equipped with the steam hammer valve, which will stand years of hard usage and continue as reliable as at first. These two features do not require any skilled attention. The possibility of grease getting into the mortar is guarded against by the construction, and there is no other point liable to give trouble under unskilled handling."

The capacity of the single stamp is large. The feeder is a familiar and reliable attachment. The number and force of blows can be set so as to obtain the best pulverizing result on the ore. Changes can, so the manufacturers claim, be made while the machine is running, and the stamp can be left to pound ore with only occasional attention. The mill requires only a small foundation, a boiler, and a shed for covering it. The accompanying cuts give a side view of the stamp mill, and a section showing the wood base adjustment for taking up shoes and dies. A machine is set up in action at the works of the manufacturers, the American Engineering Works, Chicago, Ill.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

Stamp mills are in operation or under construction in quartz mines of Alaska as follows: Windham Bay, 10 stamps; Sumdum, 15 stamps; Snettisham, 25 stamps; Sheep Creek, 30 stamps; Ready Bullion mine, 120 stamps; Mexican mine, 120 stamps; Union mine, 100 stamps; Alaska-Treadwell mine, the largest mill in the world, 540 stamps; Ebner G. M. Co., 15 stamps and 25 under construction; Nowell Co., 10 stamps; Silver Bow Basin hydraulic mine, Alaska-Juneau C. M. Co., 35 stamps; Perseverance M. Co., making preparations for 200 stamps; Rodman Bay, 200 stamps; Yankee Cove mine, 5 stamps; Borners Bay mines, 35 stamps; Seward City, 70 stamps; Funter Bay mines, 10 stamps: Sea Level, 30 stamps under construction; sundry small mines constructing an aggregate of 205 stamps. Total number of stamps, 1800.

KETCHIKAN.

The Wales C. M. Co. of Tacoma, Wash., R. M. Mountfort president, L. M. Glidden secretary, and G. W. Boggs manager, owns a group of five claims near Kassan bay, Prince of Wales Island, which it has been developing. It is claimed that the ore body on the surface is nearly 150 feet in width, and it is estimated averages 4.81% copper, $1.20 gold and 87 cents silver. It contains shoots of high-grade ore, assays from which show values from $26.76 to $83.12, with gold from $6.40 to $21 per ton.

S. Lichtenstadter of Ketchikan is driving 200 feet of tunnel on the Constitution group, Prince of Wales Island. The construction of a tramway 14 miles long between the mine and the head of Karta bay is under consideration.

YUKON.

It is reported from Porcupine, Alaska, that the camp is deserted, nearly every man in the place having left for the new diggings on Frazier creek, 75 miles from Porcupine on the Dalton trail.

Reports said to be responsible say quartz conglomerates have been discovered on Indian river, 28 miles from Dawson, rich in gold and in large bodies. Indian river and tributary creeks were thoroughly prospected for placer gold in the early days of the Klondike rush. Recently the nature of the placer material on these creeks is said to have attracted the attention of miners who had worked in the Transvaal, and impressed with its similarity to the rich "blanket" deposits of the Rand, they carried their investigations to the benches, and discovered that the escarpments of the Indian River valley were composed of immense masses of conglomerates which they found were gold bearing and at various points carried from $100 to $200 in gold to the ton. The conglomerate deposit so far located is 8 miles long and from 1¼ to 4 miles wide. Its thickness is unknown as yet.

ARIZONA.

COCHISE COUNTY.

The Calumet & Arizona Co. has bought four mining claims at Bisbee of M. Brophy and M. O'Hare for $190,000—10% of which was paid down—and five claims from Shattuck & Letson for $85,000. Work on these claims has been begun. The mines are named the Calumet & Pittsburg.

GILA COUNTY.

The Crenshaw Bros. of New York, Baltimore, Md., and Richmond, Va., own the controlling interest in the Mercer Tunnel property near Globe, with W. H. Mercer and J. A. Valentine. Mr. Mercer, the Supt., states that preliminary work on the tunnel has been commenced. The property to be developed by this tunnel consists of twenty-one claims, covering over 400 acres of ground, situated on the divide between Pinto and Mineral creeks. The tunnel will be 2000 feet long, cutting about thirty copper-bearing veins that show on the surface, and the face of the tunnel when completed will be between 1200 and 1400 feet deep. The driving of the tunnel will be let by contract, and it will be sufficiently large to admit of the use of electric or steam motors.

W. N. Bowen of St. Joseph, Mo., vice-president of the Pinto Creek M. & S. Co., is visiting the company's mines on Pinto creek. Supt. L. M. Teal has sunk the shaft on the Yo Tambien about 75 feet, giving a total depth of nearly 325 feet, and the drift from the 250-foot level has been continued about 60 feet in ore.

MOHAVE COUNTY.

J. M. Murphy of Kingman says returns from a carload of ore from the Payroll mine, Chloride, show 15 ounces silver, 1.75 ounces gold and 40% lead to the ton.

The mines located by R. M. Bryan and associates near Yavapai carry gold and coppor and occur in lime formation. Assays from the properties are claimed to show two ounces in gold with a small percentage of copper.

YAVAPAI COUNTY.

The Revenue group of mines near Congress, owned by the King Solomon M. Co. of Lima, O., is located upon a gold-bearing ledge from 4 to 6 feet in width upon the surface. The development work on the Revenue mines is in charge of W. L. Hardin. It is the intention of the company to install a stamp mill and cyanide plant later on.

The Black Rock G. & C. M. Co. of Coconino is developing a group of mines near Dewey, with W. D. Powell as Supt.

CALIFORNIA.

AMADOR COUNTY.

The Bay State mine near Plymouth has resumed operations under a bond and ten men are employed in its exploration. It is reported that the work of prospecting the result is satisfactory C. Sweeney and associates will at once put on a large force will only continue for a few months and if of men. John Ross Jr. of Sutter Creek is superintendent.

The Central Eureka mine is making an addition of ten stamps to its mill, which will make twenty stamps in all. The addition will take a month to complete.

BUTTE COUNTY.

The Lava Bed Dredging Co., Mr. Marsh Supt., finding that a large amount of dirt will have to be moved in order to get at the dredging ground, have put a steam shovel at work to move it. The big steam shovel was taken from the railroad to the mine on a track laid through Oroville streets. The track was laid in short three-rail-length sections, which were taken up and moved ahead after the shovel had passed over them.

H. P. Stow, manager of the Gold Bank mine at Forbestown, states that the lowest tunnel had been driven ahead about 1000 feet to what is known as the "Church Ledge." From this point drifting is being done and several quartz "stringers" have been encountered, all carrying gold. The Church or "back" ledge is parallel to the Gold Bank and distant on the surface about 900 feet. The point where it is reached by the tunnel is 2400 feet below the croppings on the incline.

EL DORADO COUNTY.

The Horseshoe Flat mine, at Newtown, is a placer mine in the channel of which a shaft is being sunk. A depth of 315 feet on the incline has been reached. The company operating this mine is composed of the Potts Bros., T. Smith, I. W. Dickinson and S. Maginess of Placerville.

KERN COUNTY.

A consolidation has been made of the Red Dog mill and the Stanford, Gold Coin and other claims, all at Randsburg. The Gold Coin people will hereafter run the mill.

MARIPOSA COUNTY.

D. W. McCarthy of the Columbus mine, near Mariposa, says his company has expended $30,000 in development work in the past three years and has on hand a large quantity of pay ore. One tunnel of the consolidated claims is in 1450 feet. J. W. McCarthy of Stockton is president of the company.

The Mary Harrison mine at Coulterville has had installed a new gallows-frame on the shaft and the milling of ore has been commenced. The mill is situated about 3 miles distant from the mine and is of forty stamps. The ore is hauled from the mine to the mill by a steam railway.

NEVADA COUNTY.

The Blue Tent and Enterprise claims, located at Blue Tent, have been bonded by C. L. Canfield and Eastern people, who propose to run a tunnel to tap the channel. When pay gravel is reached a 20-stamp mill will be erected. C. L. Canfield is also interested in the Bellfountaine mine, near Nevada City, and the new gravel mine at Shady creek. At the latter place headway is being made in getting ready to work in virgin ground. C. Graham is Supt. and C. Wodell is foreman.

A. T. Hall of the Grizzly Hill mine, near Nevada City, says it is the intention of the company to put in more gravel crushers in the spring.

It is reported that the Murchie mine at Nevada City has been bonded to J. C. Campbell of that place. The mine is owned by San Francisco people and embraces several ledges, varying in width from a few inches to 15 feet. The greatest depth reached is 700 feet. The ledges are in granite, the ore averaging of fair grade and being well charged with high-grade sulphurets.

Good progress is being made by Supt. Mallen in sinking the shaft from the 1200-foot level at the Brunswick mine near Nevada City. It is now down 137 feet below that level and headed for the ledge.

A San Francisco corporation has been formed to work the Minnie Bell, Alice and Stemwinder claims at Fronch Corral. The new company state that they intend to erect a mill which will have a crushing capacity of from 100 to 150 tons daily.

The Empire mine at Grass Valley has added a large air compressor to its plant. It has a capacity to supply air to thirty drills and is the largest single air compressor in Nevada county. Supt. Starr is excavating foundations for it.

Manager Starr of the Empire mine at Grass Valley says the company will soon add 20 stamps to the present mill of 40 stamps.

PLACER COUNTY.

E. Dugger, N. Collins, W. Atwell and B. Horton are developing a gravel claim in Secret canyon, 5 miles east of Colfax.

The Tadpole Con. G. M. Co. have begun work at their mine near Westville. The company expect to reach pay gravel with 100 feet advance of the tunnel.

Five new quartz mills were built in Placer county in 1901, as follows: Washington mine, near Forest Hill, 20-stamp mill; Three Stars mine, Ophir, 20-stamp mill; Rawhide mine, near Towle, 10-stamp mill; Central mine, near Damascus, 10-stamp mill to replace old mill; Shady Run mine, near Towle, 10-stamp mill.

SAN BERNARDINO COUNTY.

A rich strike of copper and gold is reported made south of Klinefolter, 12 miles from Needles, by T. Cotter and F. Robie. They have a 4-foot shaft down 38 feet and are reported to be working in a solid body of ore that runs 5% pure copper and $12 gold to the ton.

G. Zwanzig has made a discovery of soda niter near Newbury. The deposit is claimed to extend through 2000 acres of land. Tests are stated to show from a trace to 10% of niter in the beds.

SHASTA COUNTY.

Evans & Dougherty shipped one car of sixty tons of chromite from their mine at Dunsmuir to the smelters, to be used for furnace hearth lining. The buyers require that the pieces of chrome ore must not be smaller than a man's head. They pay $15 a ton f. o. b. Chromite for furnace purposes must carry 40% of chromic acid to be acceptable.

A gold mine has been discovered on the old county hospital land near Shasta, eighty acres of which land were sold to local people for $600. They have developed a quartz claim on the property and at a depth of 60 feet have found rock that is rich in free gold, which is easily discernible to the naked eye. The pay shoot is 3 feet in width.

It is reported that a large vein of high grade ore had been struck by the lowest tunnel in the Bully Hill mine at De Lamar.

The Arps group at Copper City, bonded to F. H. Hall, has been started up with F. Sletcher as Supt. Some road work has been completed and buildings constructed.

SIERRA COUNTY.

J. W. Morrell, Supt., of San Francisco has commenced work on the Balsam Flat gravel mine, near Alleghany, and is running a 1200-foot tunnel to open the gravel channel.

SISKIYOU COUNTY.

The Sheba Mine on Patterson creek, near Fort Jones, is working twenty men, who keep the 10-stamp mill supplied with ore.

The owners of the Drummer Boy have concluded to erect a 5-stamp mill at their mine on Cherry Creek, near Fort Jones.

Whip & Poole of Colorado have bonded the Empire Bar mine on Klamath river, near Yreka, at $6500. The claim is owned by D. McCarthy, J. Garvey, R. S. Taylor and J. F. Lodge.

TUOLUMNE COUNTY.

In the Jubilee group of mines, above Sonora, development is progressing on several claims. In the Purdy 175 feet has been drifted on a 2-foot vein of ore. The Evans claim is yielding considerable ore and a new shoot has been struck.

Supt. A. W. Bryant of the Prudhomme mine, near Carters, says that work continues on the rich vein uncovered recently at the 200-foot level, and the contract has been let to sink the shaft another 100 feet.

D. Pennington and others, owners of the Blue Star and the White Star mines, near Carters, drifted 250 feet along the vein in the claims, exposing a large body of ore. A mill test of eight tons showed a value of $11.50 per ton. The average width between walls is 6 feet—all milling ore.

The Star mine at Columbia has resumed operations after being closed several years. The Rose Creek M. Co., owning the mine, has bonded the mine to E. A. and J. O. Hayes of San Jose.

Very rich ore has been struck by F. Plummer and J. Purcell in a claim near Sonora. It is both milling and pocket in character. It is the intention of the owners to erect a 3-stamp mill immediately.

Manager Dron has completed the repairs on the Nonpareil mine at Big Oak Flat and pumping operations have been resumed.

The Hull mine, near Groveland, has been bonded to C. Y. De Lay. Considerable work has been done on the property and a ledge of high-grade ore opened up.

The Independent mine at Soulsbyville has been started up by a Colorado company. Mr. De Masters is the Supt. The mine has lain idle for a number of years. It is the property of T. Wost, W. Sharwood and Mrs. Curnow of Sonora.

J. Ferguson and W. Richards have bonded their quartz claim, situated on Turnback creek, near Sonora, to San Francisco and Michigan men, who have contracted to begin work within sixty days and to erect a 20-stamp mill within six months. The mine is a tunnel proposition.

COLORADO.

BOULDER COUNTY.

The Golden Eagle group of mines, consisting of the Golden Eagle, Golden Eagle No. 2, Golden Eagle Extension and the Dorchester, at Wall Street, is being equipped with a complete outfit of machinery sufficiently powerful to go down 1000 feet. J. T. Fitzgerald of Boulder is manager and J. P. Clark Supt.

The shaft on the Melvina mine at Wall Street is down over 700 feet. The ore in the Melvina is running close to $200 for general ore, with some going $640 per ton and small lots going as high as $22 per pound. The mine is owned by the Great Eastern Co. of Boston, Mass., which bought it for $150,000.

CLEAR CREEK COUNTY.

The Two Sisters M., M. & T. Co. has been incorporated to operate the American Sisters mine at Silver Creek. The incorporators are W. A. Williams, J. J. White, W. A. Pollock, E. S. Nash and F. L. Burton. The principal office will be at Lawton, with F. L. Burton manager. It is proposed to run a tunnel from Lawson 1800 feet in to the vein, opening it, together with other valuable lodes. The tunnel is to be 8x12 feet in the clear and will carry two tracks.

The Franklin Con. Co. have taken up their option on the Wilkie mill and transferred the mill to the Wilkie Milling Co., who are making improvements to it. They will add new jigs, screens, crushers and Bartlett and Wilfley tables. Later they project the building of a tramway from the mouth of the Newhouse tunnel to the mill. G. S. Wilkie, the former owner, is mill Supt.

GILPIN COUNTY.

The Saratoga mine, near Russell, has put in a new air compressor for the sinking of the shaft to connect with the Newhouse tunnel. The tunnel will cut the Saratoga mine during the summer, when a raise will be made to connect with the shaft.

The Beacon of the West mine, Russell district, is being worked under lease and bond by A. B. Berger, with W. G. Martin superintendent. The last lot of smelting ore from this property gave values of about fifty ounces gold per ton. The property is owned by H. Sayr of Denver, and the operators may decide on putting up a hoisting plant of machinery at an early date.

The British property near Lake has been started up under lease by New York people, with E. P. Thomas superintendent. The 170-foot or bottom levels are being cleaned out. Mr. Thomas says they may put up a steam hoisting plant and carry on heavier operations. This main shaft is only 180 feet deep.

Lowrey & Co. of Russell have a lease and bond on the Hayes & Wheeler mine, and have taken the water out. The shaft is about 160 feet deep, and the lessees are figuring on sinking. A whip is being used for hoisting, which may be replaced by a steam plant at an early date.

HINSDALE COUNTY.

The operations in the Golden Fleece mine, near Lake City, are expected to recover the lost ore vein, and it is now thought to have been already found 800 feet below where worked formerly. The values now found in the tunnel are in petzite ore, a combination of tellurium, gold and silver. The petzite contains about 40% silver, 16% gold and the rest tellurium. A plant will be built at the mouth of the long tunnel to have a capacity of 150 tons per day.

LAKE COUNTY.

The Homestake mine at Leadville is producing ore running from 50 to 100 ounces silver besides good values in gold, lead and copper. Since October more than 650 tons have been shipped.

Operations on the Moyer shaft of the

Iron Silver mine at Leadville are yielding 200 tons of ore a day. One of the peculiarities of the zinc sulphide in the Moyer is that $2 and $3 gold to the ton is found.

It is reported that operations on the Triumph mine at Leadville will he resumed. The Triumph is located on the gold belt.

MINERAL COUNTY.

A home mining company is being organized at Creede to operate a portion of the Bachelor mine laying helow the Nelson tunnel level.

For January to the 18th inst. the ore shipments from Creede were 3106 tons. The track throughout the Nelson and Humphreys tunnels is to he made a 2-foot gauge. It is now 18 inches. The length of the two tunnels is about 10,000 feet.

OURAY COUNTY.

The Camp Bird Extension M. Co., according to the annual report of the president, has the main tunnel on the mine at Ouray in 950 feet, with 700 feet of it in ore. An electric drill has been installed. The stockholders have adopted plans for a 100-ton milling plant construction to be commenced immediately. At the annual meeting in Denver J. H. Rohin was elected president; F. J. Campbell, secretary.

SAN MIGUEL COUNTY.

The Smuggler-Union Co. at Telluride has resumed operations in every department. The huildings destroyed by the fire of Novemher 20 last have been reconstructed, the tram is hringing down 450 tons of ore a day, the mill is turning out three to four carloads of concentrates every twenty-four hours, and 430 men are on the pay roll. At the Contention mine, which also is owned by the Smuggler Co., ahout eighty men are employed and the tramway is steadily supplying ore to thirty stamps in the old mill at Pandora.

The Boston Exploration Co. has voted to take the Japan mines, near Telluride, which have heen under examination hy their engineers for the past three months. The property comprises twenty claims and lies between the Smuggler-Union and Tom Boy mines.

SUMMIT COUNTY.

The Mountain Pride mine, on Mount Baldy, near Breckenridge, is developed by a shaft and tunnel to a depth of 350 feet, and is equipped with pumps, mill and other machinery. The Mountain Pride G. M. Co. of Denver has been organized to buy the property. J. W. Gates of Chicago ls the present owner. C. A. Finding is manager.

TELLER COUNTY.

The total of dividends of Cripple Creek mines for January is $394,650. The companies declaring dividends, and the amounts, are as follows: Portland, $180,000; Vindicator, $88,000; Mary McKinney, $30,000; Gold Coin, $30,000; Union, $25,000; Consolidated, $19,000; Strong, $25,000; New Zealand, $7650; total, $394,650.

IDAHO.

ADA COUNTY.

The Pay Day M. Co. has been incorporated, capital $300,000, with J. W. Cage president, E. G. Hurt secretary and A. L. Morris manager. The property is situated near Neal and is now being developed.

SHOSHONE COUNTY.

The metal production of Idaho for 1901 is estimated to be a gross value of $18,000,000, of which total the mines of the Cœur d'Alenes produced gross values as follows:

Bunker Hill	$2,000,000
Standard	1,500,000
Morning	1,500,000
Empire State	1,350,000
Tiger-Poorman	900,000
Mammoth	900,000
Frisco	465,000
Hunter	375,000
Hecla	186,000
Crown Point	186,000
North Side (Gold Belt)	138,000
Total	$9,500,000

IDAHO COUNTY.

The Mammoth and Great Eastern claims at Dixie, owned hy the company of that name, have ahout 800 feet of development work done and ore blocked out which, it is claimed, will assay more than $6 per ton. A 10-stamp mill is projected to he installed upon the property during the coming summer.

T. Hye, Supt. and general manager of the Dixie Queen mine and mill in Dixie, says the new 10-stamp mill on the Dixie Queen has heen working steadily since Decemher 10 and handling 40 to 45 tons of ore daily. Of the ores run through the mill so far, he says, 60% to 65% of the values is saved on plates and total values up to 95% and 97% are saved with concentration.

The Idaho Comstock mine, at Dixie, is to have, it is reported, the four stamps of its mill increased to twenty.

MICHIGAN.

HOUGHTON COUNTY.

On January 1st the approximate depths of the Quincy shafts were: No. 2, 4850 feet; No. 4, 4200 feet; No. 6, 4800 feet; No. 7, 4460 feet; No. 8, 1300 feet. The mill is stampIng 3100 tons of rock daily, yielding an average of 1⅛% mineral. Twenty-four per cent of the Quincy product is mass and harrel copper. The electrical system of tramming tested for two weeks gives satisfactory results, especially where trams are long, and further appliances of this kind will be installed.

MONTANA.

FLATHEAD COUNTY.

D. P. Bowers, manager of the Snowshoe mine, near Libby, is attempting to get all the mine owners in the Libby district to unite in estahlishing a telephone line to each of the properties where any work is now being carried on, and to make Lihby the central office for the system.

A strike is reported to have been made in the mine of the Northern Montana G. M. Co., in the West Fisher district, near Libby. A vein of rich free-milling ore 4½ feet wide has heen found in the tunnel, which is now in 105 feet.

M. J. Brick, one of the owners of the Fisher Creek M. Co.'s property near Lihhy, says that it is the intention of the company to put in ten additional stamps, which will give twenty stamps. The necessary machinery, including the water wheel, he states, is now on the ground, and the excavation and foundation have been completed.

JEFFERSON COUNTY.

The Vautour mine, near Basin, is to be developed to depth hy Tallant & Petersou, who have leased it from Beattie Bros. They have installed a steam hoist and started to sink to the 300-foot level, where they will crosscut to the vein.

The Bismarck mine, near Sheridan, is shipping ore from development work, which will be carried on during the remainder of the winter, and a concentrator will be commenced in the spring.

MADISON COUNTY.

C. Austin, manager of the Red Bluff G. M. Co., Ltd , at Red Bluff, states that the work of draining and operation of the Red Bluff mine, suspended for several months, has been resumed.

Rich gold finds are reported as being made in the west end of the Norwegian district, about 25 miles from Pony. Ahout thirty claims have already heen located and there are many prospectors. It is stated that one man with a team and wagon can make $25 a day picking up the quartz float carrying gold found on the surface. The lode from which the float has come is reported to have heen found.

J. Harkins is developing the Blue Jay mine on Kern gulch, near Virginia City. The shaft is 85 feet deep. The ore carries gold, silver and copper.

A 42-pound gold nugget, worth upward of $10,000, is reported to have been found in California Gulch, one of the tributaries of Alder Gulch. The nugget is said to be the largest of the three found at the same time by T. Ramon and J. Lefebre.

NEVADA.

DOUGLAS COUNTY.

G. Lamy of Gardnerville and associates propose to put in a power plant on the main fork of the Carson river to furnish Gardnerville with lights and to supply cheap power for industrial plants in Carson valley.

LINCOLN COUNTY.

S. E. Yount of Goodsprings reports that a new find of ore has been made ahout 4 miles northwest of Goodsprings, on the spur of Potosi mountain, Yellow Pine district, by J. C. Armstrong and J. D. Loop of Goodsprings. The discovery is of cinnabar carrying a high value in gold. The veins are on the contact of porphyry and lime. Everyone in that locality heretofore supposed that the "red cast" of the outcrop veins was iron, and they were supposed to he valueless, since the ore would not horn any free gold.

LYON COUNTY.

Kennedy & Boehme, lately from Tonopah, have leased a claim in Silver City owned by F. Golden. There is a tunnel on the property and a shaft 200 feet deep is to he sunk. There is said to he a ledge of $10 ore in the mine.

The Heather M. & R. Co. has heen organized in Dayton hy Davis & Gignoux to work several large deposits of tailings in Six Mile canyon. The company has hought the Harris Blood cyanide plant and has a large number of men employed.

STOREY COUNTY.

The Con. Cal. & Va. M. Co. has sold its ore tailings, ahout 2000 tons, at Virginia City, to J. P. Woodhury, who proposes to erect a plant on the spot for working them.

The Mammoth G. & S. M. Co. has been incorporated at Virginia City. The trustees are P. J. Keyes, M. J. Kernan, W. H. Hancock, W. V. Ryan and J. J. Quinlan; capital stock $100,000.

WASHOE COUNTY.

Hot water has been struck in the Reno Star mine at Wedekind City at a depth of about 130 feet.

A steam hoist for the Colorado-Nevada M. Co. is being set up on its mine near Wedekind City. There are now four steam hoists in a lot of land not over 100 yards square. The gold and silver production of Wedekind is now nearly a thousand dollars a day.

WHITE PINE COUNTY.

The New York & Nevada Copper Co. has been incorporated in New Jersey to operate the Copper Flat properties at Ely.

NEW MEXICO.

BERNALILLO COUNTY.

The Golden Cochiti Tunnel Co. has driven its tunnel at Bland over 800 feet. The tunnel will pass at 1350 feet depth through the Washington mine. Its projected length is 8000 feet.

GRANT COUNTY.

(Special Correspondence): The Lena M. Co., of which J. C. Carrero is manager, is erecting a 150-ton concentrating plant at Lordsburg, to treat ores from their own mine. The mill has crushers, elevators, rolls, Huntington grinders, amalgamating plates, Wilfley and Bartlett tahles and settling tanks. The ores carry gold, silver and copper.

Lordsburg, N. M., Jan. 22.

Work on the Sampson mine at Burros has been suspended while a 50-ton concentrating mill is being constructed. The ore of the mine, it is claimed, can be handled with a profit with copper down to 8 cents a pound.

The Michigan-New Mexico C. Co. ls operating at Burros and Lordsburg. The copper ore runs about 10% copper, with a few dollars of gold and silver per ton.

LINCOLN COUNTY.

A new gold camp has been established on the south fork of Benito creek. Ore has been found that averages $200 to the ton.

G. Dilliard and C. Brown of Nogal have made a rich gold strike on the South Fork of Bonito creek. The rock is said to be a perfect network of gold wire, some of it as thick as ordinary thread. A. R. Byrd, the day of the find, it is reported, bought the claim for $10,000.

G. H. Fuller of Chicago, Ill., has eighty-four mining claims at Parsons. The Eagle Creek M. Co. has heen organized to work these claims and, it is stated, proposes to spend ahout $700,000 in development work. A dam 100 feet high is to be constructed across the Bonito river. It will he 250 feet long and will be built of concrete The ore is to he worked with the cyanide process. As soon as the dam is completed machinery will be installed and shafts sunk. It is expected to handle 500 tons of ore a day.

J. M. Bryson has sold a group of claims at Estey City to New England people and has put twenty-two men on development operations on other claims retained hy him. The ore hody is over 40 feet wide and the assays show values of over $30 per ton.

LUNA COUNTY.

J. A. McCoy of Boston, Mass., is in charge of the mines of the Golden Cross & Eagle M. Co. near Carlzllilo, preparing for the resumption of operations. Boston, Mass., and Terre Haute and New Albany, Ind., capital is interested.

OTERO COUNTY.

E. M. Skeats of El Paso, Texas, has been examining the property of the Calaveras M. Association near Alamogordo. The company propose to install steam drills and erect a concentrating plant for the lead ores of the mines.

SOCORRO COUNTY.

Two hoists and other machinery are being placed in the caves near Lava, out of which guano is being mined. The 50 men employed are to he increased to 150 men. Teams are used in hauling the guano to the railroad. In addition to the guano, deposits of phosphate are heing mined. J. M. Reynolds is superintendent.

OREGON.

GRANT COUNTY.

J. P. Linstrome of the Climax mine at Granite, owned hy Spokane, Wash., people, states that the company is soon to start a working tunnel on the cross vein, which will cut the other veins in the property and will tap the last ore hody when in ahout 900 feet.

JACKSON COUNTY.

J. Broad and T. Reid, owners of the Oregon Belle in Forest Creek district, near Jacksonville, are running their mill steadily and crushing hetween sixty and seventy tons of ore every month. They report over $1400 worth of hullion, the result of a three-weeks run.

A strike has been made at Ashland in the main shaft in the Ashland mine at Ashland helow the 800-foot level. Drifting is being done on the 800-foot level and ore is being stoped from the 600-foot and 700-foot levels. The regular crew of thirty men is employed on this property.

A contract has been let by J. K. Reader to drive a 250-foot tunnel on his mine near Ashland, which will open the ledge about 100 feet below the present workings.

JOSEPHINE COUNTY.

A ledge is heing developed in the Foots Creek district hy H. A. Reed and C. C. Daniels which shows a width on the surface of 25 to 50 feet, carrying values of $4 to $6 per ton in free gold.

UTAH.

BEAVER COUNTY.

The King Bird Con. M. Co. has heen incorporated, capital $500,000, with F. Tiernan, president and R. S. Tiernan secretary and treasurer, with office at Salt Lake City. The company owns the Silver Reef, Anaconda, Yu I, Three Way, King Bird and Chicago Traction claims in the Beaver Lake district.

The shaft on the Blackhird mine in Copper Gulch, near Milford, is down 50 feet. The work is so planned that there will be no hoisting until a depth of 107 feet is attained. An old prospect tunnel has been driven in to a point beneath the shaft and 107 feet from the surface. An upraise connects the face of this tunnel with the bottom of the shaft 50 feet from the surface. All of the rock will now be shot down this upraise and out through the tunnel, greatly expediting the work. Each set of timbers in this shaft oontains 1250 feet of lumher, not counting the lagging. The timhering alone will cost between $6 and $7 per foot. It is estimated that the total cost of sinking the shaft 1000 feet will be over $40 per foot.

BOX ELDER COUNTY.

The Dana G. M. & M. Co. has been incorporated, capital $250,000, with office at Salt Lake City. J. Dederich is president and J. J. Burke secretary. The company owns the Blue Jay, Constellation, Franklin, Iola, Atlanta, Dana, Gollath, Joliet and Baxter claims in Park valley.

SUMMIT COUNTY.

The West Ontario M. Co. of Philadelphia, Pa., has been incorporated, capital $25,000, to buy or lease mines at Park City. P. L. Williams of Park City is Utah representative for the company.

WEBER COUNTY.

The Kenneth M. Co. has heen incorporated, capital $28,000, with office at Ogden. W. N. Pierce is president and F. M. Farrell secretary and treasurer. The company will develop a mine in the Willard Hill district.

WASHINGTON.

OKANOGAN COUNTY.

Manager G. L. Hedges of the Wauconda G. M. Co., at Wauconda, says the large cross tunnel has been advanced 776 feet durlng 1901, making it 1028 feet from portal to face. This tunnel is 5½x7 feet ln the clear. Three large ledges and several small ones have heen cut by the tunnel. The tunnel is being pushed with a view of cutting two others. The work is heing prosecuted with three eight-hour shifts and an average advance is made of about 5 feet daily.

S. T. Langley of Rossland, B. C., has discovered the lost gold ledge of the Okanogan mine, now the Oroville, near Wauconda. The property comprises a 4-foot ledge of free-gold ore, carrying values of $40 to $42 per ton. A 10-stamp mill was erected and 5000 feet of development work was done in 1898, when the vein was lost.

FOREIGN.

BRITISH COLUMBIA.

E. D. Sanders of Spokane, Wash., of the Sullivan Group M. Co., in East Kootenay, says that his company intends, on the completion of its smelter and lead refinery at Marysville, to add a lead corroding works for the purpose of manufacturing white lead. "What is the use," Mr. Sanders is reported as saying, "of selling our lead for 1.2 cents per pound, when we can take the hullion and refine it into pig lead, take the pig lead and corrode it into white lead and get 5 cents per pound for it?"

The Last Chance M. Co., which is controlled hy Los Angeles, Cal., people, has made an important strike in the Last Chance mine near Sandon. The company has completed an 1800-foot tunnel at a cost of $50,000 and has struck the ore vein at a depth of 1600 feet below the surface, making, it is stated, the deepest mine opening in the Northwest. The ore continues of a high grade, running 130 ounces silver and 65% lead, this proportion be-

tween the two minerals being nearly uniform throughout the mine. J. Stinson of Los Angeles, Cal., the S. McDonald estate and B. Wilson of Victoria are large stockholders.

From Vancouver and New Westminster hundreds of men—miners, business men and clerks—are stampeding to new placer fields discovered at Sumas, near the international line, about 50 miles from Vancouver. The discovery was made by William Davis. The location is on an alluvial flat, a former bed of the Fraser river. Out of the one hole Davis took $10 worth of gold.

Wm. F. Robinson, Provisional Mineralogist of British Columbia, says of the mineral production of that Province, that: "Roughly speaking, the increase made in 1901 over 1900 is 25% on gross values of output of the Province. There is an appreciable drop in the placer gold production, owing to the sudden melting of the snow last spring causing freshets and leaving a shortage of water during the latter part of the season. The tonnage of ore mined from the lode mines in the past is about 871,832 tons, equal to an increase of 317,036 over the year 1900, a little more than 57%. There has been an increase in the output of all the metals with the exception of lead, the low price obtainable in this Province for lead ores having discouraged this class of mining, except where accompanied with good silver values. The gross value of the copper output has increased 206% over 1900, while lode gold has increased 36% and silver 14%." The comparative values of the principal mineral products are as follows:

	1900.	(Estimated). 1901.
Gold, placer	$1,278,724	$ 892,500
Gold, lode	3,453,381	4,704,200
Silver	2,309,200	2,624,002
Copper	1,615,289	4,951,698
Lead	2,691,887	1,970,641
Coal	4,318,785	4,587,630
Coke	425,745	637,800
Other materials	251,740	309,030
Totals	$16,344,751	$20,677,501

The Tyee M. Co. has ordered the plant and equipment for a smelter at Ladysmith, Vancouver island, and a tender has been accepted for an aerial tramway to carry the ore to the smelter. Work is to be commenced within two months.

At the Rambler-Cariboo mine, Nelson district, the main shaft is 270 feet below the third level, giving a total vertical depth of 770 feet. The concentrator at the mine is complete and it is expected to start about March 1, treating 80 to 100 tons of ore daily. The intention is to sink the shaft 200 feet farther.

The output of Rossland mines for the week ending January 25 was 5860 tons, divided as follows: Le Roi, 4600 tons; Le Roi No. 2, 1200 tons; Cascade, 30 tons; Bonanza, 30 tons.

KLONDIKE.

A second stamp mill has been put in operation at Dawson, doubling the amount of quartz which can be handled daily. The new mill is owned by the Ladue G. M. Co. The mill handles ten tons daily. It has four stamps, weighing 850 pounds each. The striking feature of the advancement of the Klondike into actual existence as a quartz camp is the suddenness with which a vast amount of gold-bearing quartz has been offered for crushing. The Munger mill has been running steadily since it started, and the Ladue Co., it is reported, cannot begin to accept all the orders offered it. It is said that at least four similar mills more are needed to crush the quartz which mines now in operation can furnish.

A second bedrock on El Dorado creek, 30 feet beneath the first, is reported found. The gravel from it yields from $1 to $5 to the pan.

The receipts of royalty last year by the creek or districts in Yukon Territory were as follows:

Forty-Mile	$ 599 00
Eureka	391 00
Dominion	37,751 41
Sulphur	11,581 91
Gold Run	37,084 87
Hunker	36,526 86
Grand Forks, including Bonanza, El Dorado and numerous hillside and bench claims and gulches of the vicinity	249,211 81
Total	$381,162 89

The number of claims worked on a small scale during 1901 are said almost to have doubled over 1900, and since there have been so many small producers the output on the whole has been distributed among more owners and the royalty exemptions in the aggregate are large. The total export of gold this season, according to reports kept at the boundary, has been $16,304,682 75. No gold was allowed to be taken out unless accompanied by a certificate of export issued by the Government. These figures of the amount exported and the amount on which royalty was paid, when compared, show that half of the dust on record as exported was exempt from taxation.

MEXICO.

It is reported that R. E. Jennings, president of the Crucible Steel Works, and several officers of the United States Steel Co. have bought the Viceroy silver mines, situated in the Mapimi district of Mexico, for $1,000,000.

The railway of the Green Con. C. Co. connecting La Cananea, Sonora, with the American railway system at Naco, the terminus, upon the international boundary of the Naco branch of the El Paso & Southwestern Railway, has been completed into La Cananea, at a distance of 40 miles from Naco, and a regular freight and passenger traffic has been inaugurated.

It is reported that the La Calera Co., whose copper property is in Altar district, Sonora, has made plans to proceed at once with the erection of a $250,000 reduction plant and to construct a railroad from the mines to the Gulf of California coast.

NATAL.

An application has been made to the Commissioner of Mines of Natal for a license for dredging rights over Durban bay. The applicant is satisfied that the bay contains sufficient gold to make the venture pay well.

PERU.

It is reported that, in view of the heavy fall in the price of copper and in order to prevent the threatened closing of several copper mines in Peru, several trans-Atlantic steamship lines have lowered their freight rates on copper by 7 shillings per ton. Lima business men have requested the Central Railway to reduce the present rate on copper transportation from the mines to the coast.

Mr. Neill, Secretary of Legation at Lima, reports the formation of an American syndicate, with headquarters in New York, for taking over copper and other mines in Cerro de Pasco. The ores of this district, he reports, contain gold, silver, lead and copper. The amount of silver coined, smelted and exported from Peru from 1786 to 1850 was 285,613,796 ounces, of which 161,451,731 ounces were from Cerro de Pasco alone. The exportation of copper ores from Cerro de Pasco in 1900 was 11,944.2 metric tons, besides 5138 tons of copper bars. These ores, on being assayed, have given grades between 18% and 40%. A projected railroad will lower freight charges from $39 per ton when carried by llamas to about $11.66, and the price of coal from $24.85 per ton to about $3.88. The American syndicate owns five-sixths of this district, having 480 square miles. It is reported that another syndicate is being formed for the purpose of securing and working the rich copper mines in the Yauli district.

TRANSVAAL.

The Chamber of Mines of Johannesburg has issued a report showing that the output of the mines for December, 1901, was 52,897 ounces of fine gold, against 39,075 ounces for November.

Books Received.

"Register of Mines and Minerals, Lake county, Cal.," has been issued with a map by the California State Mining Bureau as one of a series of County Registers of mines which has been in preparation for several years. The mineral springs, of which there are seventy-five reported, are the special feature of the Lake County, Cal., Register.

"Cyanide Practice," by Alfred James, mining and metallurgical engineer, 8vo, 174 pages, illustrated. The author was the late technical manager of the original company introducing the cyanide process, and has an experience covering the entire period of the development of the process. The book is designed to be generally instructive of the process, its local modifications and apparatus, rather than minutely technical. It is largely a record of individual experience and not a compilation. It will be found instructive and useful to the constructing engineer of cyanide plants. Published by Engineering and Mining Journal, Incor., New York. Price, $5.

Trade Treatises.

FROM the John A. Roebling's Sons Co. of Trenton, N. J., comes a comprehensive catalogue of 76 pages, illustrating and describing in detail the many products of this old reliable house. The catalogue will be sent anywhere on request made to the home office, or to any of the branch offices located at 117 Liberty street, New York, 171 Lake street, Chicago, and 25 Fremont street, San Francisco, Cal.

Personal.

A. M. JOHNSON is manager of the Ophir M. Co. at Statoline, Utah.

E. CRAMER of Hailey, Idaho, is sojourning in Salt Lake City, Utah.

H. C. ROBINSON is exploring at Patani, in the Slamese-Malay States.

JOHN GLEESON has resigned as Supt. Copper Belle M. Co, Gleeson, Ariz.

C. J. KIMBALL is Supt. and David Kyle foreman, Union mine, Bradshaw, Ariz.

C. A. FINDING is manager of the Mountain Pride mine at Breckenridge, Colo.

J. HARKINS has resigned as foreman of the Alameda mine, near Virginia City, Mont.

BEN STANLEY REVETT expects to return from England to Breckenridge, Colo., next month.

JOHN GRAY is now Supt. Verde King M. Co., Arizona, with headquarters at Prescott, Ariz.

FREDERICK S. HARRIS has resumed the management of the Dorada mine, at Sonora, Mexico.

A. J. COLQUHOUN will have charge of the quicksilver mining development work at Savonas, B. C.

C. H. COLPE succeeds L. B. Doe in the management of the Jubilee M. Co.'s property, Sonora, Cal.

ROBT. MOORE of St. Louis, Mo., has been elected president American Society of Civil Engineers.

L. F. J. WRINKLE is surveying for a new cyanide plant at the old California mill, Virginia, Nev.

F. SLETCHER has been appointed Supt. of the Arps copper mine at Copper City, Shasta county, Cal.

WM. CARKEEK is drawing plans for the new 500-ton concentrator for the Shannon Co., Clifton, Arizona.

T. H. BARCLAY, former Supt. Elkhart mine, Chloride, Ariz., is now Supt. Hall Mines, Ltd., Nelson, B. C.

JOHN CARPENTER is the new foreman of the De Lamar C. M. & S. Co.'s Bully Hill mine, Winthrop, Cal.

W. MITCHELL has been appointed assistant manager at the Greene Con. M. Co. at Cananea, Sonora, Mexico.

J. L. BRYSON, Supt. of the Gold Crown mine at Omega, Nevada county, Cal., is sojourning in San Francisco.

EDWIN REYNOLDS of Milwaukee, Wis., has been elected president of the American Society of Mechanical Engineers.

F. GRIFFITH has resigned the management of the Red Dog mill, Johannesburg, Cal., being succeeded by Supt. Munn.

T. MCCABE, foreman of the Salt Lake & Tonopah M. Co. at Tonopah, Nev., has been appointed Supt. for the company.

ARTHUR HENDEY has gone from Jerome, Arizona, to Caborca, Sonora, Mexico, to test some placer properties there.

J. A. VAN LEUVEN, late assistant engineer with the U. S. Corps of Engineers at Havana, Cuba, has located at Redding, Cal.

J. D. GRAHAM, Gold Commissioner of Atlin, B. C., has returned from a sojourn at England to his home at Revelstoke, B. C.

L. M. COCKERILL is now manager United Mexican Mines Association, Ltd., at Guanajuato, Mex., succeeding R. H. Williams.

J. R. MORRISON of Nevada City is in San Francisco en route for Siberia. He will go there with A. S. Bigelow to engage in mining.

R. E. HANLEY, Supt. of the Copper King mine at Kennet, Cal., has resigned. It is understood that D. Muir will be Mr. Hanley's successor.

W. H. SEAMAN, of El Paso, Texas, has been appointed superintendent of the Copper Belle mines, at Gleeson, Arizona, succeeding John Gleeson, resigned.

COL. W. H. H. HEUER, U. S. Engineer Corps and senior member California Debris Commission, has returned to San Francisco from Nevada county, Cal.

CHAS. D. LANE and Messrs. Williams and Martin, who have been inspecting Silver Peak and Tonopah, Nev., properties, have returned to San Francisco.

F. C. SCHRADER of the U. S. Geological Survey sails for Valdez, Alaska, on the 15th inst. with eight assistants on an extended reconnoissance in the Copper river country.

ELBERT H. GARY, chairman of the board of directors of the United States Steel Corporation, has been elected chairman of the board of directors of the Allis-Chalmers Co.

GEO. H. EVANS, formerly general manager California Gold Mines Co, Oroville, Cal., now in the same capacity for the Gold Pan Dredging Co., Breckenridge, Colo., is visiting San Francisco, where he will sojourn during February. He is in charge of the most extensive enterprise of the kind in that country.

DUNCAN MCVICHIE has been elected general manager of the Bingham Con. M. Co. at Bingham, Utah, succeeding O. P. Posey, who retires to devote his entire time to his personal mining investments.

E. R. ABADIE is mentioned as the probable successor of Fred Zeltler as superintendent Champion Mining Co, Nevada Co., Cal, should that gentleman's proffered resignation be accepted by the directors.

JAMES HOWLISON, of Otago, N. Z, has been appointed general superintendent for the West African Dredging Syndicate, at an annual salary of $7500. The property of the syndicate includes 150 miles of river claims over which Mr. Howlison has jurisdiction.

W. J. LORING, formerly of the Utica mine, Angels, Cal., and later Supt. of Melones mine, Robinson, Cal., takes the general superintendency of a mine in Coolgardie, Australia, at an annual salary of $9000, leaving San Francisco, Cal., on the 6th inst.

E. E. OLCOTT of New York City for president; S. F. Emmons, Washington, D. C., Jas. Gayley, Pittsburg, Pa., J. H. Lee, Carbon Hill, Ala, for vice-presidents; E. W. Parker, New York City, Jas. W. Neill, Salt Lake City, Utah, M. D. Valentine, Woodbridge, N. J., for managers; T. D. Rand, Philadelphia, Pa., for treasurer, and R. W. Raymond of New York City for treasurer, are the names of the nominees for officers of the American Institute of Mining Engineers to be voted on at the eighty-second meeting of the Institute, the thirty second annual meeting in New York City on the 18th inst.

Commercial Paragraphs.

THE Giant Powder Co., 435 California street, San Francisco, Cal., will remove next week to their handsome new offices in the just completed Hayward building, northeast corner California and Montgomery streets, San Francisco, where they will occupy what are considered the most desirable offices in that section.

HEALD'S SCHOOL OF MINES, 24 Post street, San Francisco, Cal., is now under the direction of J. B. Balcomb. The scope of the school has been broadened and in addition to increased facilities of instruction the school will accept outside surveying, assaying and construction. A specialty is also made of coaching students in mathematics. Plans are about completed for moving into larger quarters.

THE New Process Raw Hide Co., Syracuse, N. Y., reports business as good at the opening of the new year. The company is in receipt of an order from the British Westinghouse Elec. & Mfg. Co. for sixty of its New Process noiseless pinions for the equipment of the British Company's new plant. These pinions are to be used on motors for driving machine tools, electric cranes, etc., and are for transmitting from 5 to 40 H. P. They write: "Orders from other sources are coming in fast and the outlook is promising for a good business year."

GEORGE E. WOODBURY, the concentrator manufacturer of 223 First street, San Francisco, Cal., has been appointed agent for the Wilfley concentrator. By a recent decision of the U. S. District Court the Wilfley patents have been sustained, shutting out concentrators of the table type. Mr. Woodbury has made an agreement with the Mine & Smelter Supply Co. of Denver Colo., which enables him to manufacture his Imperial tables. Both tables are favorably known to mining men. Mr. Woodbury says he "has a carload of machines on the road from Denver, but hereafter the machines will be built in San Francisco under my personal supervision. The best material will be used and no expense will be spared to keep up the present standard of this well-known table. We propose to protect our patent rights and will hold any person responsible attempting to infringe upon the same." Mr. Woodbury has the exclusive right of California, also the right of selling in any part of the United States.

OWING to the change in fuel conditions in the past two or three years, due to the oil discoveries in California, the Government decided some time ago to install a complete new boiler plant at Mare Island Navy Yard, opposite Vallejo, Cal., and the Government officials selected the Heine safety water tube boiler, manufactured by the Risdon Iron Works of San Francisco, Cal. The new plant will aggregate 500 H. P., and arrangements are being made so that another 500 H. P. boiler can be installed later. This is the boiler that made such a record at the Midwinter Fair at San Francisco in 1894. The Risdon Iron Works has recently made a number of large sales of these boilers, among which are for the new

building of the Mutual Savings Bank, the new plant of the Independent Light and Power Company, the St. Luke's Hospital and the San Francisco Gas and Electric Company, San Francisco. These boilers are claimed by the manufacturers to be peculiarly adapted for use by mining companies; that their construction enables them to be shipped in only moderately large pieces; that they can be put together at the mine and that they are peculiarly adapted for using impure water. They are used exclusively by the following large companies: Alaska-Treadwell, Boston & Montana, Anaconda C. M. Co., De Lamar G. M. Co., Independence mine and others.

Latest Market Reports.

SAN FRANCISCO, Jan. 30, 1902.

SILVER.—Per oz., Troy: London, 25½d (standard ounce, 925 fine); New York, bar silver, 55⅝c (1000 fine); San Francisco, 55¾c; Mexican dollars, 45½c San Francisco, 44½c New York.

COPPER.—New York: Lake, 1 to 3 casks, $12.00; carload lots, $11.87½; Electrolytic, 1 to 3 casks, $11.87½; carload lots, $11.75; Casting, 1 to 3 casks, $11.62½; carload lots, $11.50. San Francisco: $14 15. Mill copper plates, $17.15; bars, 24@18c. London: £51 7s 6d per ton.

LEAD.—New York, $4.10; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £10 16s 3d per ton = 2.26 cents per lb.

SPELTER. — New York, $4.30; St. Louis, $3.90; London, £17 2s 6d per ton; San Francisco, ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, $16.00; gray forge, $16.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $28.00; open hearth billets, $30.00; San Francisco, bar, 7c to 12c per lb.

TIN. — New York, pig, $23.50; San Francisco, ton lots, 25c; 1000 lbs., 25½c; 500 lbs., 25¼c; 200 lbs., 25½c; less, 26c; bar tin, ℔ lb, 30c.

PLATINUM.—San Francisco, crude, $19 ℔ oz.; New York, $20.50 per Troy oz

QUICKSILVER. — New York, $51.00 large lots; London, £8 17s 6d; San Francisco, local, $48.00 ℔ flask of 76½ lbs.; Export, $45.00

MAGNESIUM.—New York, $2.90 ℔ lb.; San Francisco, $3.75.

ZINC.—San Francisco, 5½c; slab, 5¾c; bar, 7c; zinc dust, N. Y., 6c.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 17c; San Francisco, Plumbers', 100-lb. lots, 14.25c.

NICKEL.—New York, 50@60c ℔ lb.

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $53.50, large lots.

TUNGSTEN.—New York, ℔ lb., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 32c; San Francisco, 65c (60%).

ASSAY LITHARGE.—San Francisco, 10c ℔ lb, small lots.

PHOSPHORUS. — F. o. b. New York 50@60c ℔ lb.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c ℔ set; 14 oz., 40s., 9c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 30@31c ℔ lb.; carloads, 28@29c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c ℔ lb.; soda ash, $1.90 ℔ 100 lbs.; hyposulphite of soda, 2¾@3c ℔ lb.; blue vitriol, 5¾@6¼c ℔ lb.; borax, concentrated, 7@8c ℔ lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2¼@2½c; California refined, 1¾@2c; nitric acid, in carboys, 8c ℔ lb.; caustic soda, in drums, 3@4c ℔ lb.; Cal. s. soda, bbls., $1.25@1.50 ℔ 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls. 8c: caustic potash, 10c in 40-lb. tins.

OILS.—Linseed, pure, boiled, bbl., 72c; cs., 77c; raw, bbl., 70c; cs., 75c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 90c; cs., 95c; No. 1 bbl., 65c; cs., 70c. Neatsfoot Oil, coopers' bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC FEED REGULATING APPARATUS.—No. 691,627. Jan. 21, 1902. George Hoepner, San Francisco, Cal., assigned to the Union Scale & Manufacturing Co. of Sacramento, Cal., a corporation. This invention is designed to provide for an approximately even flow and pressure of material passing through a hopper and belonging to an automatic weighing machine. It consists of a weighing bucket having a vertical movement, a hopper delivering into said bucket, a gate closing the discharge from the hopper, an open-bottomed funnel movably suspended above the discharge part of the hopper, a connection between the funnel and the hopper gate whereby said gate is opened by the descent of the funnel, means for locking the gate in its open position, and means connected to said look and controlled by the weighing bucket for releasing the lock. A funnel is suspended within the hopper from one end of a fulcrumed lever, the other end of which connects with the gate, and an inverted cup fixed centrally within the cone of the funnel regulates the flow of material and prevents the movement of the parts being interfered with by the body of grain within the hopper.

DEVICE FOR FORMING ORNAMENTAL STRUCTURES.—No. 691,596. Jan. 21, 1902. L. B. Christopherson, Stockton, Cal., one-half assigned to M. M. Gillespie. The object of this invention is to form ornamental structures from flexible strips of material This material may be leather or other suitable material which is cut into rectangular form, then a number of slits are made longitudinally with intermediate uncut portions alternate from one side to the other of the strip. The strip is then opened transversely and by means of suitable unions or connecting pieces the edges of the strips thus opened out are secured through the unions to like edges of adjacent strips, and in this manner provides curtains, table covers, festoons, piano scarfs and ornamental structures generally can be easily made.

PROTECTING TREES.—No. 691,546. Jan. 21, 1902. T. J. Hubbell, Watsonville, Cal., assignor to D. Hubbell and W. H. Ames, same place. This invention comprises a method of protecting trees from the ravages of codlin moth and similar enemies of trees It consists in applying a plastic substance to the trunk to form an even surface, then placing a soft annulus about the trunk proximate to the coated surface, and finally placing a flexible strip about the trunk and securing the upper edge just above the annulus, said strip having its surfaces coated with a viscous or glutinous substance.

HAY LOADING APPARATUS.—No. 691,659 Jan. 21 1902. E. H. Nicholson, Santa Maria, Cal. This invention comprises a rake having a horizontal portion and an upwardly projecting rear portion. Tapes are fastened to the top of the rear portion and detachably secured to the forward end of a horizontal portion. A rake is moved along the ground until a load has been gathered upon it, and the detachable front ends of the ropes are then carried up over the load, and by pulling upon the ropes the load is rolled from the rake up the incline and upon the wagon.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING JANUARY 21, 1902.

691,606.—JAR CLOSURE—R. H. Austin, S. F.
691 595.—FRUIT GATHERER—J. D. Carter, Baker City, Or.
691,597.—BICYCLE—A. P. Christiansen, Gardnerville, Nev.
691,596.—ORNAMENTAL STRUCTURES—L. B. Christopherson, S. F
691,7 4.—HAY LOADER—F. S. Church, Sierra Valley, Cal.
691 532.—CHILD'S CHAIR—I. M. Clark, Lompoc, Cal.
691,357.—GAS GENERATOR—W. W. Cozins, Linden. Cal.
691,612.—PISTON PACKING—H. Dods, Virginia City, Nev.
691,614.—PEN HOLDER—S. W. Durham, San Jose, Cal.
691,457.—SILK REEL—J. P. Evertz, San Diego, Cal.
691,702.—ROTARY CUTTER—T. F. Hagerty, S F.
691,376 —FRUIT PICKING SACK—E. Harter, Arlington, Cal.
691,627.—FEED REGULATOR—Geo. Hoepner, S. F.
691,546.—TREE PROTECTOR—T. J. Hubbell, Watsonville, Cal.
691,365.—HORSESHOES—S. Jannus, San Carlos, Ariz.
691,648.—SMELTING FURNACE—G. Mitchell, Los Angeles, Cal.
691,649.—PIPE CUTTER—G. Mitchell, Naco, Ariz.
691,659.—HAY LOADER—E. B. Nicholson, Santa Maria, Cal
691,7 6.—BEVEL—N. B. Norfolk, Los Angeles, Cal.

Dams and Reservoirs.

Probably in no class of engineering structures will there be so many new constructions of great works during the next few years as of dams and reservoirs. This is particularly the case in the western portion of the United States, though some notable dam structures of great magnitude are already under way in the East. Cities during late years have grown in population and industry out of all proportion to estimates made a decade or two ago. With the growth has come a proportionately greater expansion of the use of water till in many instances it has outrun in ten or twenty years the provision of supply made in the expectation that it would suffice for fifty years, or even a century.

The ceaseless commercial pressure for the cheapest and most permanent source of power is a second great cause of the starting up of activity toward the conservation of water supplies. The third great cause is the development of land values in the arid and semi-arid regions made possible by the use of water.

All of these economic demands, working on the surest lines toward the quantity and permanence of water supply, are most completely satisfied by the construction of artificial reservoirs and dams. Natural stream flows are irregular and uncertain in quantity with the change of the seasons. Reservoirs that store flood water can be used to equalize the quantity of stream flow through all the seasons. They also conserve flood waters that can not be used in the flood seasons to the seasons of no floods, when the use of the water is indispensable.

With a perfected knowledge of what may hereafter be required of the stored water of reservoirs, the construction of the latter is now made complete in the beginning. Timber, vegetable growth and surface soils that may impair quality are now removed in advance of the dam construction. The latter is now planned and proportioned in the beginning to ultimate structural limits. The causes of many failures are being studied to insure a higher degree of safety in subsequent structures.

It is suggested that, in the planning of dams, engineers should take no chances. Safety is an absolute requirement. Many dams are now being planned of great height and length. The conditions of water pressure on the dam which will be developed when the reservoir made by it is filled with water, should be studied in advance. Many rocks not permeable by water, so as to create hydrostatic pressures on the base of a low dam, become permeable and develop water channels through which the hydrostatic pressure of the water column behind the dam acts with lifting force against the base, where the dam is high. This possibility should be thoroughly studied out to a certain conclusion in advance.

Constructing engineers will understand that such a hydrostatic pressure applied by nature through even minute rock seams and openings acts on the dam in the manner of the pressure developed by a hydraulic press. It is a quantity of energy in the form of a lifting force, which balances an equivalent in weight of the dam and the resultant pressure of the reservoir water against the face of the dam. The real stability of the structure is measured by the quantity of unbalanced weight. This latter can be increased by increasing the mass of the dam over what is required to insure against overturning by the direct pressure of the reservoir water on the inside face. This results in the necessity of engineers considering these great dam structures as problems for which each must have its own formula of safety. Too great a dependence must not be placed on a general formula in high dam construction.

More than any other structure built by engineers, dams should be fool-proof. The element of weakness that is forever potential in man should be eliminated. There should be left no opportunity for human judgment, or the failure of it, to determine the maintenance of dam structures. The materials of construction should be, as far as human foresight can provide, imperishable. It is very questionable if composite dam structures should be built at all where one or more of the materials of construction is perishable. The steel portion of composite steel and concrete structures, allowed to deteriorate by the carelessness that fancied security always induces, is sure to fail some time. Spillways that are not open permanently, but depend on attention from an operator, should not be permitted in dams.

THE Senate has passed the bill creating the Department of Commerce. For the Senate the action was quick. The bill to create the Department of Mines is still in committee in the House. Now that the latter has control of the bill creating the Department of Commerce the members with mining constituencies should see to it that it gets no preference of consideration and right of way over the bill creating the Department of Mines. The latter is as desirable as the former, if not indeed more desirable. To even up the legislative situation the bill to create the Department of Mines should be passed by the House and sent to the Senate in advance of the House consideration of the Senate bill to create the Department of Commerce.

ATTEMPTS at the wholesale appropriation of mineral lands in California seem to be continuous. The latest is located in Shasta county, where a railroad project to open up the Bully Hill copper district and the Pitt river country has been made the pretext for a mineral land appropriation by the old methods. There is a public protest developing, but so far the adverse individual claims of miners, which do the effective fighting against such attempts, are not much in evidence. If effective opposition is to be made, the miners themselves, who are affected by the fraudulent appropriations, must contest them. The presence of valuable mineral on public land is a fact which has to be proven before a trial court. The miners should not delay getting the evidence and presenting it to the land office in proper form.

MINERS in the Territories are receiving some well directed attention from Congress, and legislation is under consideration looking to their protection from the neglect or carelessness of mine operators. There is no excuse for needlessly unsafe mining. If a mine will not pay the cost of securing the safety of the miners who work in it, it should not be permitted to be operated. Legislation by Congress for miners, while it requires considerable time, is apt in the end to be better balanced to the respective rights and necessities of all parties interested than laws made by local legislatures on the same subject matter. It is much less influenced by the temporary interests of individuals or localities. The pending laws relating to coal mine ventilation should be enacted. Advantage might well be taken of the opportunity to add amendments, by providing some necessary laws about mine openings. The preventing of one such disaster as that at the Smuggler mine at Telluride, Colo., justifies such action.

Monopolies of Mineral Production.

The monopoly of a natural mineral production is an attractive commercial idea. With some minerals it has been accomplished with a sufficient degree of commercial success to obscure, or at least make indeterminate, the limitations of such monopolies. The conception of the idea of a monopoly of a mineral product is rarely made by the miners. It is usually originated by the business men who are only incidentally miners, and who see in minerals which come out of the earth things to be bought and sold of which nature has limited the quantity. It is assumed that if there are limits to the quantity of mineral in available natural deposits, and these limits are known, there is the basis of a monopoly in its production and sale. The creation of the monopoly is business. The means used to accomplish it are considered as constituting an art by themselves.

There are temporarily real limits to the available natural supply of some minerals. It is doubtful if there are any permanent real limits. Monopolies of production of minerals are, therefore, only at the best more or less temporary. It is the people who clearly recognize this condition and limitation that make the business successes of it.

Diamond production is at the present time, perhaps, the most conspicuous example of a mineral monopoly. The South African diamond fields at Kimberley and vicinity are the most productive and cheapest worked deposits. The supply from this source originally took control of the market for diamonds by selling the cheapest and in quantity to supply the entire demand. Stopping the production from other fields—notably Brazilian fields—by selling under the cost of production in them, a consolidation of the individual interests in the limited South African field has made a monopoly strong enough to advance the price again by regulating the supply. Still, it cannot be affirmed that there are no other deposits which can be discovered, and, discovered, make a quantity of production which will break the monopoly. It is possible yet to find the rock source of the Brazilian diamonds, which so far have only been recovered from detrital placer deposits. Reports of discoveries in British Guiana of diamonds in detrital deposits indicate quantities which it is hardly thinkable could exist far from original rock sources. Exploiting these new fields, apparently highly payable, with the experience and knowledge we now have of original diamond-bearing rocks, it is reasonable to assume that not many years will elapse before these rock sources are found and a possible rival to Kimberley establishes itself. Could the sale prices, that make the present monopoly so profitable, be maintained when a considerable increase in the quantity of diamonds produced is made? It hardly seems reasonable to so conclude.

Other gem stones, excepting only the ruby, seem to be too widely and plentifully distributed to become the basis of a monopoly of their production. The sapphire apparently looked promising for this purpose and less than a year since the known Montana deposits that might compete were consolidated to control prices and quantity of production. Since then two other localities in Montana are found to be largely sapphire bearing, and the commercial value of the consolidation already made is practically discounted and wiped out of existence. The discoveries of corundum in Montana in still other localities are suggestive, too, of still more sapphire bearing localities to be found. Arizona and New Mexico are productive of so many new turquoise discoveries that the monopoly supposed to have been successfully and firmly established on the first discoveries is at an end.

Among minerals in common use in the arts, borax a number of years since was supposed to have natural limitations of available deposits which made their consolidation practicable. Just as it was effected and became commercially profitable the extent of available deposits increased by discoveries which destroyed the monopoly. The monopoly of the production of nitrate of soda which the owners and operators of the Peruvian deposits have had is about to be broken by the discoveries of deposits in the California and Nevada deserts.

With attempts at monopoly of several metal productions there has been the same conclusion. In nearly every instance the monopoly effected by consolidation lasted just long enough to demonstrate that the limitations of available natural deposits of the metal ores were very much underestimated. It can be added that the conclusions demonstrated that what were in fact limitations were not at all comprehended in advance. Two attempts have been made to monopolize copper production. The first was more of the nature of a "corner" in the metal as a commodity than a monopoly of production. Its ultimate failure suggested as the cause the failure to monopolize the production of the mines. The second attempt undertook this last. It failed because there were more copper mines, and more mines which produce copper, than the projectors of the monopoly had estimated in advance. With zinc there are more or less tentative projects for a monopoly, but experience is recent enough with copper to suggest that a monopoly of the purely zinc producing mines becoming profitable would make new zinc mines out of the waste dump piles of hundreds of mines to which an earning from zinc would be like finding money on the highways.

Even the production of iron and coal cannot be monopolized on the basis of natural limitation of deposits. There are substitutes for coal. Iron is common and the monopoly of deposits in one locality does not prevent development in another locality. On the contrary, it furnishes the incentive to development. The very publicity that the success of a monopoly in a mineral or metal brings suggests the sharing of its profits by imitation of it on a large scale or competition with it on a small scale.

SOME waste in the operation of a mining business is inevitable and unavoidable. More kinds of waste are avoidable. The distinction should be noted and all losses of efficiency of men, machinery or methods should be investigated and measured in order to eliminate such as can be determined as being avoidable. The line between the necessary and the avoidable waste is not fixed. It is itself variable, and each problem of operation is to be solved recognizing this. To illustrate, in the simplest mining operation—the mining and milling of gold-bearing quartz—no complete recovery of the gold in the rock is made. Some must waste, no matter what methods of mining of ore or reduction of it are employed. The amount of that absolute loss or waste is more or less dependent on the scheme of work. The cost charges of the different schemes of work also vary. The scheme of work that makes the sum of the cost charges and the absolute loss the least is the best, commercially considered, independent of whether or not the absolute loss is the least possible. The loss here is an unavoidable loss, to be accepted even though it is not the least loss of gold that could be made. The same principle extends through all expert determination of mining schemes. Neglect of it with many mining operations means the difference between commercial failure or commercial success. And it must not be assumed that in mining there is any other kind of success but commercial success that counts. Eliminate avoidable wastes, but be sure that it is certainly known what are the real avoidable wastes.

NEVADA COUNTY, CAL., is already showing the effect of the increased attention being given to gold mining in the last month or two. For some years there had been no gain in the extent of, or production from gold mining. If anything, the impression from a casual investigation would be, that the number of the mines and their output was diminishing somewhat. Lately, however, there has been a notable increase in new enterprises and in reopening old mines. Grass Valley and Nevada City districts, while easily first in the extent of this favorable change, have no exclusive possession of it. The old camps of Rough and Ready, French Corral, North Bloomfield, Washington and Meadow Lake, that in the lapse of years had become all but abandoned, have taken on a new period of life with the reopening of the old mines. As mines are exploited to-day these old mines are in their infancy. Some of the supposed worked-out properties are found with barely prospected croppings, though mills built on them in the early hurry days of California mining long since disappeared even as streaks of rust. There is nothing but what is good to be said of the present expanding gold mining industry of Nevada county.

Concentrates.

THE velocity of sound in water is 4.9 miles per second.

THERE is no California State tax on the issue of stock in corporations.

AN ordinary speed to run pumps is 100 feet of piston motion per minute.

A CUBIC FOOT OF ICE weighs 57.25 pounds and of water 62.38 pounds.

THE water in the river must be above the trough to make the water wheel run.

AN ALLOY that expands in cooling is made of 75% lead, 16 2/3% of antimony and 8 1/3% of bismuth.

TO SHARPEN DULL FILES, immerse them in dilute sulphuric acid till they are eaten into deep enough.

THE life of a good gas or gasoline engine under ordinary conditions and with proper care is fifteen to twenty years.

A "STANDARD CANDLE" is one that consumes 120 grains of spermaceti per hour, made six to the pound, and ⅞ inch diameter.

ALUMINUM BRONZE can be produced by highly heating a mixture of alumina and copper chloride in contact with calcium carbide.

AN ordinary burn from an electric current can be relieved by application of a solution of one part nitric acid and seventy-five parts water.

"CONCENTRATES" does not know why a forked willow stick turns down in the hands of some men and does not in the hands of other men.

A DYNAMO can be run by water power as well as by steam, but it will be absolutely necessary to secure steady motion by a steady pressure of the water.

MINING LOCATIONS can be made in forest reservations on compliance being made with rules and regulations established by the Interior Department.

BOILER TUBES often wear through rapidly where internal feed pipes are allowed to rest upon them. Such pipes should be hung from the braces or shell.

THE proportion of ferro-manganese used in a ton of steel is so small in amount that it is scarcely calculated, even though that product costs nearly $100 per ton.

A MINING LAW in Colorado prohibits parties from locating mining claims before sunrise in the morning and after sunset in the evening. There is no such law in California.

IN a case decided in the Douglas county, Or., circuit court it was held that the right of private ownership of land bounded by unnavigable streams extends to the center of the stream.

THE chief commercially exploited minerals found in Peru are gold, silver, copper, coal, quicksilver, petroleum, salt, borax, lime, ochre, marble, sulphur, alkaline salts and phosphates.

NO LOCATION of a placer claim can be made to exceed 160 acres, whatever may be the number of locators associated together, or whatever the local regulations of the district may allow.

THE largest gas engine built on the Pacific coast is a 300 H. P. engine built by the Union Gas Engine Co. of San Francisco. The Westinghouse Electric & Mfg. Co. of Pennsylvania has built a 650 H. P. gas engine.

THE deputy surveyors who were supposed to have surveyed many of the townships in the arid and treeless regions failed to establish corner monuments. Having never been placed originally, they cannot be found by retracing the lines. They must be re-established first.

BY USING for the making of mortar lukewarm water in which carbonate of soda has been dissolved, masonry can be built with the temperature as low as 18° F. below the freezing point, the laying of the stone in cold weather of that temperature being attended with satisfactory result.

THE highest price of Lake copper in 1901 was 17 cents, lowest 13 cents; in 1900 highest 17 cents, lowest 16.25 cents; in 1899 highest 19.25 cents, lowest 13.37½ cents; in 1898 highest 13.12½ cents, lowest 10.85 cents; in 1897 highest 12 cents, lowest 10.75 cents; in 1896 highest 12 cents, lowest 9.75 cents.

AN ordinary 16-candle power 110-volt lamp has about 220 ohms resistance. About 1000 feet of No. 10 B. & S. gauge copper wire has an ohm resistance. Two thousand feet of the same wire would have two ohms resistance, while a wire twice its size in cross sections would have only one-half an ohm resistance.

HYDROCHLORIC ACID is made by the action of sulphuric acid on common salt, gaseous chlorine gas being evolved and sulphate of soda formed. The chlorine is transformed into hydrochloric acid by absorption in apparatus through which water is traveling. "Bluestone" is the result of direct action of sulphuric acid on copper oxide.

UNDER the laws of Colorado a mechanic's lien can be put on property in favor of architects, engineers and artisans who have rendered professional services on property, and declares that the right shall extend to all persons who shall do work or furnish material for the working or developing of any mining claim, or for such services in search of metals or minerals. The courts have held that a geologist or mining expert, who contracted to explore and examine certain mines and the surrounding country in reference to their mineral and geological character, is not entitled to a lien on the property for such services.

MEXICAN mining law does not recognize "extralateral rights." On that subject it says: "The unit of concession or mining claim shall be a solid of indefinite depth, limited as to its exterior boundaries by a section of the surface embraced within horizontal plane measuring 100 meters on all four sides, and in depth by vertical planes passing through the same."

AS BETWEEN round and square drift bolts driven into wood in holes ⅛ inch to ¼ inch smaller than the bolt, engineers give preference to the round bolt. The holding power of a 1-inch bolt varies from 6000 to 15,000 pounds per lineal foot, depending on the kind of wood, the relation between diameter of hole and diameter of bolt, and the time after driving before the test is made.

A COMPASS SURVEY made with care, but requiring no special refinement of methods, will accomplish what is required to direct the work of making a connection between two drifts on the same level of a mine. To eliminate any difficulty from magnetic attraction, read the angles between the courses, setting up the compass at every angle and reading the interior angle between the back sight and the fore sight.

UNDER the Revised Statutes of the United States, Section 2324, providing that, on the failure of a claimant to perform the requisite amount of work on a mine, it shall be open to relocation, unless the original locators shall have resumed work on a mine before such relocation, where plaintiff in good faith resumed work on a mine previously located by him the day before the defendant's location thereof, plaintiff has the superior right thereto.

THE ampere is the unit for the rate of electric flow, and one ampere produces a certain effect, which effect is as definitely and accurately determined as the flow of a gallon of water per second. It is the current which, when flowing in one direction, will deposit, from a solution of nitrate of silver, metallic silver at the rate of 0.001118 grain per second. An ordinary 16-candle power 110-volt lamp uses about one-half ampere. Amperes, like volts, in themselves do not represent power.

WITH a fall of 55 feet (55 feet head), and a flow of 10 cubic feet per second, to find its power: Ten cubic feet of water weighs approximately 625 pounds. Taking the product of these two factors, 625×55 equals 34,375, the number of foot pounds per second of the waterfall. This divided by 550 gives the horse power, as a horse power equals 550 foot pounds per second; 34,375 divided by 550 equals 62.5, the horse power or rate of work of the fall. This acting for one hour would do 62.5 H. P. hours of work, and in two hours 125 H. P. hours of work.

WHERE two dissimilar rock formations come together the line of joining is called a contact. Such a contact may be mineral-bearing. One horizon of the contact may have enough mineral concentration to make a mine. Another horizon of the same contact may be barren or have too little mineral to pay. The horizon of a contact as here referred to is the line as exposed at the surface or other similar lines beneath the surface. If there is no value to justify mining at the surface, only mining work with the pick and drill will tell whether there is any beneath the surface.

ALUMINATE OF BARIUM, a compound formed by the action of baryta on bauxite, is said to be a good and cheap agent for the purification of water which contains gypsum or lime in solution. It is readily soluble in pure water, but added to water containing either gypsum or carbonates of lime a double decomposition takes place, an insoluble aluminate of calcium being produced, together with insoluble sulphates or carbonates of barium. The precipitate, which is flocculent, settles readily and takes down with it at the same time any organic impurities suspended in the water.

IN chloridizing roasting of gold ores, the temperature must be kept down in order to prevent the volatilization of the gold chloride that has been formed. The loss of gold by its volatilization in the form of a chlorine compound may, with chloridizing roasting, be as much as 40% to 90% of the content of the ore, according to the degree of temperature and the duration of the roasting. At 100° C. gold is only slightly volatile in an atmosphere of chlorine gas. The volatility increases, slightly however, up to 250°. It then diminishes to below a red heat, but it increases anew at an incipient red heat and increases without interruption to a white heat.

THE nautical mile is a length equal to the average one minute of arc of the earth's meridans. It is 6063 feet or 1852 meters. The expression "knot," as used to express the rate of sailing of a ship, is the equivalent of nautical mile. Its origin came from the old means used to measure the speed of sailing. A triangle of wood, called the "log," was attached to a line and thrown over the stern of the boat when the latter was moving. Against the resistance of the vessel it floated upright and the line being paid out remained stationary while the vessel moved away from it. The cords had knots in it 1/120 of a nautical mile apart. These knots were counted as they passed through the fingers as the vessel moved, and the number passing in half a minute gave the speed of the ship in "knots" or nautical miles per hour. The name has outlasted its origin. The log now is a small screw propeller fastened at the end of a line and towed after the ship. The propeller turns as it is drawn through the water and twists the line till it turns. The number of turns made are registered on a dial at the ship end of the line and the distance traveled is read directly from the dial face.

THE Doetsch process is in use at the Rio Tinto, Spain, copper mines. The ore, being first crushed into pieces of a maximum thickness of ½ of an inch, is mixed with 2% salt and ferric chloride and then piled in heaps 13 feet high, 48 feet long and 48 feet wide. Air and water circulate through vertical chimneys and horizontal canals. On top of each pile is a platform from which water percolates throughout, dissolving the sulphate of iron and salt, producing chloride, that solution taking up the sulphide of copper, the resulting drainage into the basins precipitating cement by means of old iron rails and pig iron, the cement averaging 82% copper. It is a slow but effective process, occupying about two years, at the end of which less than 1% of copper remains in the ore.

SECRETARY OF THE INTERIOR HITCHCOCK has given a decision establishing a rule that "where the same person or company owns several contiguous mining claims capable of being advantageously worked together, and adopts one general system for the purpose of developing them all, the value of the work done and improvements made pursuant to such system, whether done on only one of the claims, or outside of them all, is available toward meeting the requirement of Section 2325 of the Revised Statutes relative to expenditure of $500 for each of such claims. It is not necessary, in order to have its due share of such work or improvements credited to each claim, that such claims should all be embraced in the same proceedings for patent. If the mining laws are complied with in other respects, such claims may be applied for and entered singly or otherwise, and at different times, without in any way impairing the right to have the value of such share credited to them, respectively, under that section."

IN mines where there is a source of electricity always available for lighting, power, etc., current can be taken off the mains for shot-firing purposes. This is a simple and convenient plan and can be used especially in shaft sinking. Caution requires, however, to be exercised or accidents may occur, chiefly because the electric current is a continuous one and there is always, therefore, the risk that, owing to some leakage, a current may be generated in the firing circuit and because the current strength is usually greatly in excess of what is required for shot firing. The conducting cables should be well insulated and should never be connected to the wires of the fuses until all is ready for firing the shot. It is, moreover, best not to trust to an ordinary simple firing key for making contact between the mains and the firing circuit, but to use a bi-polar switch, which insures that neither of the cables of the firing circuit is in electrica connection with the mains until the shot firer throws the switching, when both cables are simultaneously connected with the terminals from the mains.

THERE are several processes of boring wells for oil in use. First, the rotation method, which is used extensively; second, the process of percussion with ropes; third, the process of percussion with rods. The first process involves the use of an auger for boring into and through soft shale, clay, sandy deposits and generally soft stuffs found in the formation of the earth. The auger is like the carpenters' tool and is from 6 to 10 inches in diameter. The tool is easily turned by means of a crosshead at the opening and is sunk into the hole as fast as the latter is bored by means of lengthening rods. These rods are usually 1-inch gas pipes with connections. The boring is done by two men at the capstan, and as fast as some of the earth is loosened it is removed by the sand pump by the letting down of scoops or by using a thread-like contrivance for working up the residue. About 20 to 30 feet per day can be bored in this way and a depth of 400 or 500 feet is the average reached. The second process, which involves the boring of oil wells by percussion with rope, is used in connection with the ordinary oil well rig so frequently seen in newly discovered oil fields. First the derrick is erected, then a steam engine is needed, a band wheel, walking beam and a sand pump. The engine operates the walking beam, to the end of which is attached the device for working the drill. The action of the drill consists in a constant lifting and falling motion, developed by the walking beam, and at each plunge the bit is turned slightly, so that the action is the same as a stone cutter drilling a hole with a chisel and hammer. As fast as the bit loosens the earthy substance the particles are pumped up by means of a sand pump. This type of device can be used in rock as well as soft earth. Boring by percussion with rods calls for the service of connecting rods instead of ropes, as in the previous mode. The rods can be wood or iron. The machinery consists of a machine for driving the rods and the cutting tool. The cutting tool is almost a plain chisel ranging from 10 to 30 inches wide, with a straight edge for soft rock and a beveled edge for hard rock. Sometimes there are two, four or six blades to the chisel. The boring rods are jointed so as to permit lowering to great depths. Two men work the driving machine, which is a windlass for lifting and depressing the rods. It is a simple affair. One man operates the raising and lowering contrivance and the other turns the rod a little at each blow. These are mostly for wells about 100 feet deep. Scoops are used to remove the loosened rock or other material at the bottom of the hole.

Realizing on Concentrates When Shipping is Impracticable.

Written for the MINING AND SCIENTIFIC PRESS by E. A. H. TAYS.

During the last two years' run of the Anglo-Mexican Mining Co.'s mill at San Jose de Gracia, Sinaloa, Mexico, there were produced about 50 tons of concentrates, assaying ahout $60 per ton, that were piled to one side as heing of too low grade to warrant shipping, the idea heing to accumulate until there should he sufficient on hand to warrant the erection of a small smelter. However, that time never came, as the mill was closed down before any great amount had accumulated.

When the last of the slimes had heen run through the cyanide plant we had ahout 3 tons of cyanide on hand, and also zinc hoxes full of partially treated zinc. As there was no market for the cyanide, the idea occurred to me to treat the concentrates mentioned hy cyaniding, the idea heing to get $500 from 50 tons of concentrates (a hy-product) and turn what cyanide might he consumed into cash.

The concentrates had weathered for ahout three years, some two-thirds heing under a rough shed, the halance in the open air. These concentrates should have been roasted, hut that was out of the question. However, all showed signs of oxidation, and due to this. I calculated that we stood a good chance to get at least a 50% extraction, which would give us the desired results.

The weathering had concentrated the hody and

Anglo-Mexican M. Co.'s Cyanide Plant, San Jose de Gracia, Sinaloa, Mexico.

values of the material to some extent, hut our mean expense for shipping, calculated from nearly 1000 tons shipped, showed we could expect only ahout $10 net per ton, or ahout $500 for the lot.

Taking all this into consideration, two tanks were fitted up with filter hottoms (we had heen agitating) and 31.4 tons of the least oxidized material was charged into one, No. 9, and the remainder, 19.6 tons of the more thoroughly oxidized, was charged into the other, No. 10.

In order to wash out the iron and copper sulphates a stream of water was run through the tanks at the rate of two tons per hour for ninety-six hours, when reagents (ferric and harium chloride) showed no signs of soluhle sulphates.

A 0.3% cyanide solution was then run on for twelve hours at the rate of 1.5 tons per hour, and as the tails solution showed no trace of cyanide the strength of this was increased to 0.5% for ten hours more. There heing still no trace of cyanide in the solution coming off, the strength was increased to 1% and run at that for twelve hours.

There heing no sign of cyanide in the tails solution after thirty-six hours' run, and a consumption of 1500 pounds, treatment was suspended and samples taken from the tanks for assaying, so as to see what we were doing, although the zinc hoxes showed we were evidently getting gold. The assays showed an extraction of only 10% from the tank (No. 9) containing the least oxidized ore, and 66% from the tank (No. 10) containing the more oxidized ore, or a mean of 37%.

Calculations showed that we were doing fairly well financially, though rather poorly metallurgically. Treatment was continued for sixty-four hours longer with a 0.3% solution, when the strength was reduced to 0.2%.

It was the one hundred and twenty-second hour of treatment, from the start, hefore the solution coming off showed any signs of a trace of the cyanide, though some of it carried as high as $18 per ton in gold.

Seven hours after the first sign of cyanide in the tails solution treatment was suspended, the following heing the general results:

TANK NO. 9 (LEAST OXIDIZED).

	Gold Per Ton.	Silver Per Ton.
Heads	126.00 grams	241.00 grams
Tails at 56 hours	96.00 grams	234.00 grams
Extraction	23.81%	2.90%
Tails at 129 hours	62.00 grams	231.00 grams
Extraction	50.79%	4.14%
Bullion produced	2009 60 grams	314.00 grams
Cash value	$1335.48 gold	$6.06 gold

Tons treated, 31.4, yielding $1341.54 U. S. gold.

TANK NO. 10 (OXIDIZED).

	Gold Per Ton.	Silver Per Ton.
Heads	99.00 grams	249.00 grams
Tails at 36 hours	34.00 grams	196.00 grams
Extraction	65.65%	21.28%
Tails at 129 hours	14.70 grams	89.30 grams
Extraction	85.15%	64.13%
Bullion produced	1456.28 grams	3130.00 grams
Cash value	$967.77 gold	$60.41 gold

Tons treated, 19.6, yielding $1028.18 U. S. gold.
Total value extracted from both tanks, $2369.72.

After the thirty-six hours some lime was put into each tank and spaded into the surface.

The first lot of solution that was run through the zinc hoxes assayed per ton as follows, original solution, 0.3% cyanide:

	Gold.	Silver.
Heads	11.00 grams	1.60 grams
Tails	2.24 grams	0 20 gram

The second lot, original solution, 1% cyanide:

	Gold.	Silver.
Heads	21 92 grams	3.10 grams
Tails	11.76 grams	0.80 gram

The third lot, original solution, 0.3% cyanide:

	Gold.	Silver.
Heads	28.80 grams	4.96 grams
Tails	14 42 grams	0.48 gram

The tails solution at first was made up to standard and run through the tanks again, hut towards the last it was all pumped up into the storage tank and run through the zinc hoxes again, with the following results:

	Gold.	Silver.
Heads	20 00 grams	5 52 grams
Tails	12.22 grams	9.44 gram

Some little Prussian hlue was noted in the zinc hoxes, and the solution was of a whitish color — turhid — as though colored hy cohalt.

These results heing very unsatisfactory, we having been accustomed to a precipitation in the zinc hoxes of from 95% to 98%, all the solution was again pumped up into the storage tank and mixed with that from the last flow from the tanks, this heing run through the hoxes with the following results:

	Gold Per Ton.	Silver Per Ton.
Heads	7.76 grams	2 58 grams
Tails	6.88 grams	0.68 gram

This was again pumped up into the storage tank and 150 pounds of slacked lime added, the tank having a capacity of 44 tons. When this was done the solution, although rather whitish at the discharge pipe as it fell into the tank, immediately clarified.

The solution, thus treated with lime, was again run through the zinc hoxes, with the following results, the strength of the solution heing 0.6% cyanide:

	Gold.	Silver.
Heads	5.64 grams	0.68 gram
Tails	1.28 grams	0.44 gram

The trouhle with precipitation was due, perhaps, to a small amount of ferric sulphate that remained undissolved hy the thorough washing given the ore before treatment hegan. This, comhining with the cyanide, prohahly produced a ferrous potassium ferric cyanide, which was undouhtedly detrimental to a free precipitation in the zinc hoxes.

As stated, slight signs of Prussian hlue were noted at times in the hoxes, and the solution, until the lime was added, was always slightly turhid.

The lime radically remedied the evil, whatever it may have heen. I noticed that when the turhid solution fell into the tank containing the lime the clarification was virtually instantaneous.

The final results were the following:

EXPENSES.

Labor	$ 120 00
Materials	873 13
Sundries	9 49
Bullion expenses	103 79
Total	$1,106 41
Production	$2,369 72
Expenses	1,106 41
Profit	$1,263 31

COST PER TON.

Cyanide, 62 2540 pounds	$16 94
Labor	2 36
Bullion and all other expenses	2 40
Total	$21 70
Extraction	$41 81
Cost	$21 70
Profit	$20 11

These results are excellent in comparison to what the profit would have heen had we shipped the concentrates to California, our nearest market; hut had the 31.4 tons weathered in the open air, as did the 19.6 tons, the result would have heen just ahout $1000 hetter.

Belt Conveyers on Gold Dredgers.*

An opportunity of reducing the cost, and, at the same time increasing the efficiency of a dredger, is to he found in the application of the perfected helt conveyor to the work of stacking tailings. The Rohins Conveying Belt Co., who manufacture a helt conveyor for this service, have, they state, developed it as a result of actual experimental work on the material to he handled. When they wished to learn the proper size and inclination for stackers of various capacities, they first ohtained several tons of round placer gravel, of the same size as is found in the ancient river heds of California, the stones averaging from four to eight pounds in weight, with a numher of larger houlders, weighing as much as 100 pounds. They then constructed a self-contained belt conveyor, 50 feet in length, so supported that it could he raised to any required pitch. The gravel was delivered in its normally wet condition at the foot of the conveyor, and after being delivered into a chute at its upper end, the same material was carried hack hy a second conveyor, and was in this manner used over and over again. It was possible to change at will the speed of the inclined conveyer with an electric controller.

An example of their type of conveyer is illustrated as installed on the Indiana Gold Dredging & Mining Co.'s dredger at Oroville, Cal. The conveyer shown is 75 feet long with a 28-inch helt, and handles ahout 75 cuhic yards of gravel per hour. The speed of the belt is 250 feet per minute and the angle of inclination is 18° ahove the horizontal.

A large numher of other conveyers of the same type are used in the gold fields of California and Idaho and as far away as Colomhia and Eastern Siheria. The conveyers most commonly used are 80 feet long, which permits of stacking tailings to a height of 35 feet. They are made for this work in all sizes hetween 20 inches and 36 inches, and a great advantage claimed hy the manufacturers for the Rohins conveyer for this work lies in the fact that power can he applied at the lower end, therehy saving the long, and generally tiresome, transmission of power hy rope or chain to the head end, as is necessary with stackers of some other types. The particular advantage which appeals most strongly to the operator of a dredger lies in the fact that a helt conveyer is a very simple machine and largely free from hreakdowns. Further information in regard to the use of helt conveyers for stacking tailings may he ohtained from the Rohins Conveying Belt Co., 15–21 Park Row, New York.

*See Illustrations on front page.

Magnetic Separation of Zinc Ores.

A type of magnetic separator, installed several months ago in a plant erected at Rico, Dolores county, Colo., has since heen enlarged and now handles sixty tons of crude ore daily, the separated zinc ore ohtained heing shipped to the Belgium spelter works.

A company using the same process is now erecting a similar plant in Leadville, Colo., under the supervision of E. B. Green, who huilt and conducted the Rico plant. The work of construction is already under way and the plant, it is stated, will soon he running.

The method of the process as employed at Rico is as follows: The ore is crushed and run over Wilfley tahles, where the lead and silica are separated from the zinc and iron. The latter product is then run through the magnetic separator, the magnets taking out the iron and leaving a clean commercial product, carrying 55% to 60% zinc, worth $12.50 to $15 a ton to the mill. Mr. Green states that the magnetic separator can take a sulphide carrying 20% zinc and treat it successfully, making, in fact, three commercial products—a high-grade lead concentrate, an iron sulphide with practically no zinc, hut which will carry silver, and a higher grade zinc than that supplied hy the Missouri mines.

The initial capacity of the Leadville plant will he fifty tons a day. One feature of the process is a drier for the purpose of expelling the moisture incident to wet concentration. The cost of operation is said to he very low, and it is expected to render the several products ohtained much more profitahle than they are at present.

Mine-Pumping Plant With Electrically-Driven Centrifugal Pumps.

The silver mine of Horcajo, in the province of Ciudad Real, in Spain, was first opened in 1855, and has since been developed so that it supports at present a population of about 5000 gathered into a settlement around the mouth of the mine. In this time the workings have been advanced to a depth of 1280 feet, and are being carried down farther at the rate of about 18 feet a year. The removal of inflowing ground water from the mine has been involved with many difficulties almost from the first, and it is only in the last two years that a plant has been put in operation that fully meets every requirement of the present, and is perfectly adapted to downward extension of the workings (a limiting depth for the mine of 1640 feet is at present in contemplation). The pump installation is highly interesting, chiefly for two reasons: First, the pumping is done by means of compounded centrifugal pumps following closely in design the best principles of turbine construction; and, secondly, an electrical power-distributing system of the most advanced type is interposed between the source of power and the pumps, which gives to the whole plant the feature of simplicity and flexibility that is a large element in its success.

The conditions required to be fulfilled by any pumping installation in this mine were that it be absolutely reliable in operation, that extension to greater depth might be rapidly and easily accomplished, and, as a secondary matter, that it be reasonably economical in the use of coal. Though the first two conditions were of prime importance, the location of the mine—20 miles of mountain road from a railroad station—required considerable attention to the third.

The successful installation consists of three-phase generators driven by horizontal compound engines feeding current to the induction motors directly connected to the pumps. Pumps are installed one unit each at the eighth, fifteenth and nineteenth levels, at respective depths of 470 feet, 940 feet and 1260 feet below the mouth of the mine, and a fourth unit at the lowest level that is being worked. A reserve pump unit is always on hand, and as a lower level is attacked this unit is put in place and connected to the piping, the one in the level just above being cut and dismounted, to be set in place in the next level when that is opened.

The pumps constitute the most interesting feature of the plant. Each pumping unit is a four-stage pump, having four pressure wheels mounted on the same shaft and within the same case. The total pressure against which each unit works, running at 900 revolutions per minute, is about 240 pounds per square inch. The construction is shown in Fig. 1, which gives a longitudinal section through at the left center line of shaft, and at the right a transverse section through center line of discharge casing. The four-blade wheels, marked a, h, c and d in the longitudinal section, have water passages curved as shown in the sections. The arrangement of channels leading the water from one wheel to another is intricate. Just outside each pair of wheels, a, b, c and d, is a casting, g^1 and g^2, rigidly fastened to the pump casing, in which spirally curved guide passages are formed, and, as indicated by the arrows, the water flows outward through these guides into annular collecting chambers surrounding the respective wheels. From the collecting chambers separate sets of passages lead the water to the inner openings of the succeeding wheel. Between wheels b and c these passages are comparatively direct, but between wheel a and b, and c and d, the water must flow through channels, h, of triangular section cored out in the guide castings g^1 and g^2, respectively, between the guide channels for the discharge of the wheel. The annular chamber receiving the discharge from wheel d is larger than the others, and is fitted with two outlet openings located on opposite sides at angles of 45° with the horizontal. In any particular case, the more conveniently placed of these two outlets may be used, the other being closed off by a cover plate. Similarly, the suction end of the pump is formed as a tee with two opposite openings, so that no matter which side of the pump faces the piping no trouble will be experienced in making the connections.

The action of the pump exerts a resultant thrust toward the left end of machine, and to take this thrust a ball bearing is provided, shown at the extreme left end of the shaft. To the right of this is a ring-oiling journal bearing; the other bearing is formed in the cover of the pump, on the right, and is lubricated by a compression grease cup. Where the shaft passes through the casing at the left it is surrounded by a tight bronze sleeve, m, which passes through a stuffing box, n. In the lowest pump in the mine, which has a pressure less than atmospheric in its suction end, the pipe, k, is provided, leading from the first pressure chamber to a small passage surrounding the shaft just behind the stuffing-box, and producing thereby a water-seal that prevents the entrance of air at any point.

The construction of the pump is such that all parts may be readily taken apart and inspected or cleaned. The cover casting at the right may be removed on loosening the screws holding it to the case, whereupon the shaft, together with wheels, guides and channel castings, may be drawn out. In operation it has been found advisable that each pump be thus taken apart and cleaned every two or three months. At such times the bronze sleeve, m, is renewed, as the grit in the water produces rapid wear at this point. The ball thrust bearing also requires renewing rather frequently, but it is found that neither wheels nor guides wear appreciably, although the water contains much fine, sharp, quartz sand.

Each pump unit is driven by a motor mounted on a common base with the pump and connected with it by an elastic jaw-clutch coupling.

The motor is a six-pole, three-phase induction motor operating with a potential of 1000 volts and at a speed of 850 to 900 revolutions per minute, with a normal capacity of 250 H. P. The details of the design were largely influenced by the small starting torque required. Each field winding has forty-two turns, seven wires in each layer. The three coils of each phase are series-connected among themselves, and the sets are mesh-connected with each other. The rotor has 180 slots, each carrying two copper bars of rectangular cross-section; each set of six successive bars is connected in a series circuit. The motor is almost entirely enclosed, so that it might be protected as much as possible from condensation and drip liable to occur in the chambers of the mine. The design is remarkably compact; the largest diameter of the motor case is 56 inches, and the total weight of the machine is about 5.3 tons.

The greatest care was given to thorough insulation in the construction of the motors. Shortly before the new installation was put into service an accident to the old machines permitted the water to rise so that the lower windings of the stator were submerged for several hours. The following day the motor was carefully dried out with a charcoal fire, and, upon being tested, showed not the least deterioration of insulation. Another motor, after running nearly a year, became so charged with soot and dust that the flame of a lamp used in examining the bearings ignited this accumulation. The motor was stopped and the fire extinguished by closing the air openings; the motor was found to have suffered no damage whatever, but was cleaned and running again in 3½ hours. Since that time the motors are cleaned at regular intervals.

The generating plant consists of the three steam engines of the old pumping plant belted to a generator, and one new engine direct-connected with its generator. The old engines are horizontal cross-compound engines of the poppet valve type; they are at present run at a speed of 84 revolutions per minute, though originally intended for only 65 revolutions per minute; with steam at 110 pounds and high pressure cut-off at ⅕ stroke, 240 H. P. are developed. The generator belted to each of these engines is a 20-pole generator running at 270 revolutions per minute and delivering a three-phase current at 1000 volts pressure. The normal capacity is about 280 H. P.

The new engine recently installed is in general similar to the three other engines, but runs at 110 revolutions per minute. With steam at 110 pounds and high-pressure cut-off of ⅕ stroke, a power of 375 H. P. is developed. The generator direct-connected with this engine is a revolving field, 48-pole alternator. A belt-driven pole exciter is used in connection with this generator.

The shaft through which the piping is carried is used for no other purpose. It was therefore feasible to run the transmission cables in this same shaft without particular means for protection. A framework of old rails is laid across the shaft at intervals of about 35 feet, and on these frames the cable-carrying clamps rest. One of a pair of such clamps is shown in Fig. 2, which needs no further comment.

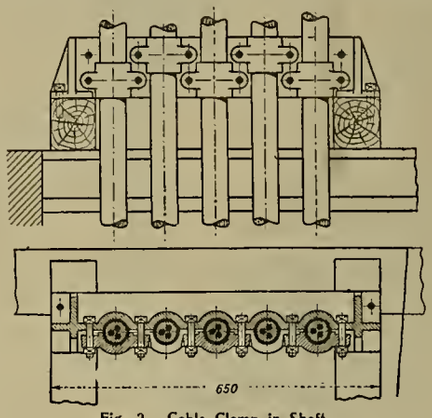

Fig. 2.—Cable Clamp in Shaft.

Provision is thus made for ten cables, which will meet all possible future requirements. Each cable has three insulated conductors, each of 0.12 square inch section stranded together. The cable has a double lead sheath and is armored with two layers of galvanized iron wire. The cable weighs seven pounds per linear foot; it can sustain the weight of a length of about 1000 feet of itself. A reserve cable leads into each pump chamber as precaution against accident.

The method of starting the pumps is rather interesting. An autotransformer with 400 volts pressure in the secondary is first thrown into the circuit of one generator. The motor is then thrown on, taking a current of 200 to 240 amperes. When it reaches its normal speed the current suddenly drops, and the full tension is then put on the motor. The second motor is then started, then the third, and finally the transformer is cut out. During this period of starting, the engine driving the generator in use is run below its normal speed. The pumps are then not able to overcome the delivery pressure and the only power consumed is that necessary to churn the water in the wheel cases. When all motors are running at speed and under line tension, the engine is slowly speeded up, until the pumps begin to deliver water. The flow, however, is throttled by valves at the lowest pump and at the delivery at the surface, so as to prevent overload on the generator. The second and third generators are then thrown in successively, in parallel with the first, and the water valves fully opened, putting the system into complete operation.

In operation up to the present the maximum demand made upon the system has been twenty-two gallons per second; the mean pumpage during this time has been 1,425,000 gallons in twenty-four hours, an average of 16.5 gallons per second. Below about fifteen gallons the pumpage is regulated by throttling the water discharge; above that limit the regulation is accomplished by manual governing at the steam end.

All parts of the plant have proved most satisfactory. The pumps were tested before installing; they were found to deliver 18.5 gallons per second under 425-foot head, when running at 890 revolutions per minute. The efficiency obtained was 76%. The motors driving the pumps showed efficiencies of 94% and 42% at 250 H. P. and 150 H. P. output (cos p = 0 85 and 0.80 respectively). The armature slip is very small, amounting to only 0.7% at 165 H. P. output. The generators are also of high efficiency. The three older alternators yield 93% efficiency at 300 H. P. inductive load (cos p = 0.8), and 90% at 150 H. P. The newer and larger machine presents about the same figures at 400 and 200 H. P. output, respectively.—Dr. F. Heerwagen in the Zeitschrift des Vereins Deutscher Ingeniere.

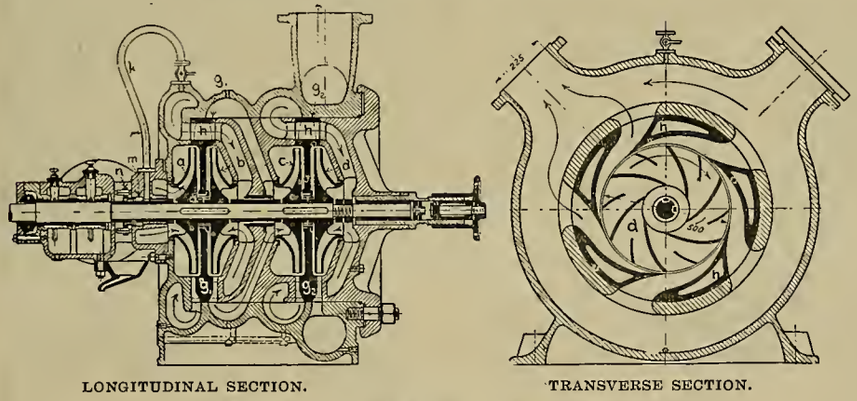

Fig. 1.—Four-Stage High-Pressure Centrifugal Mine Pump.

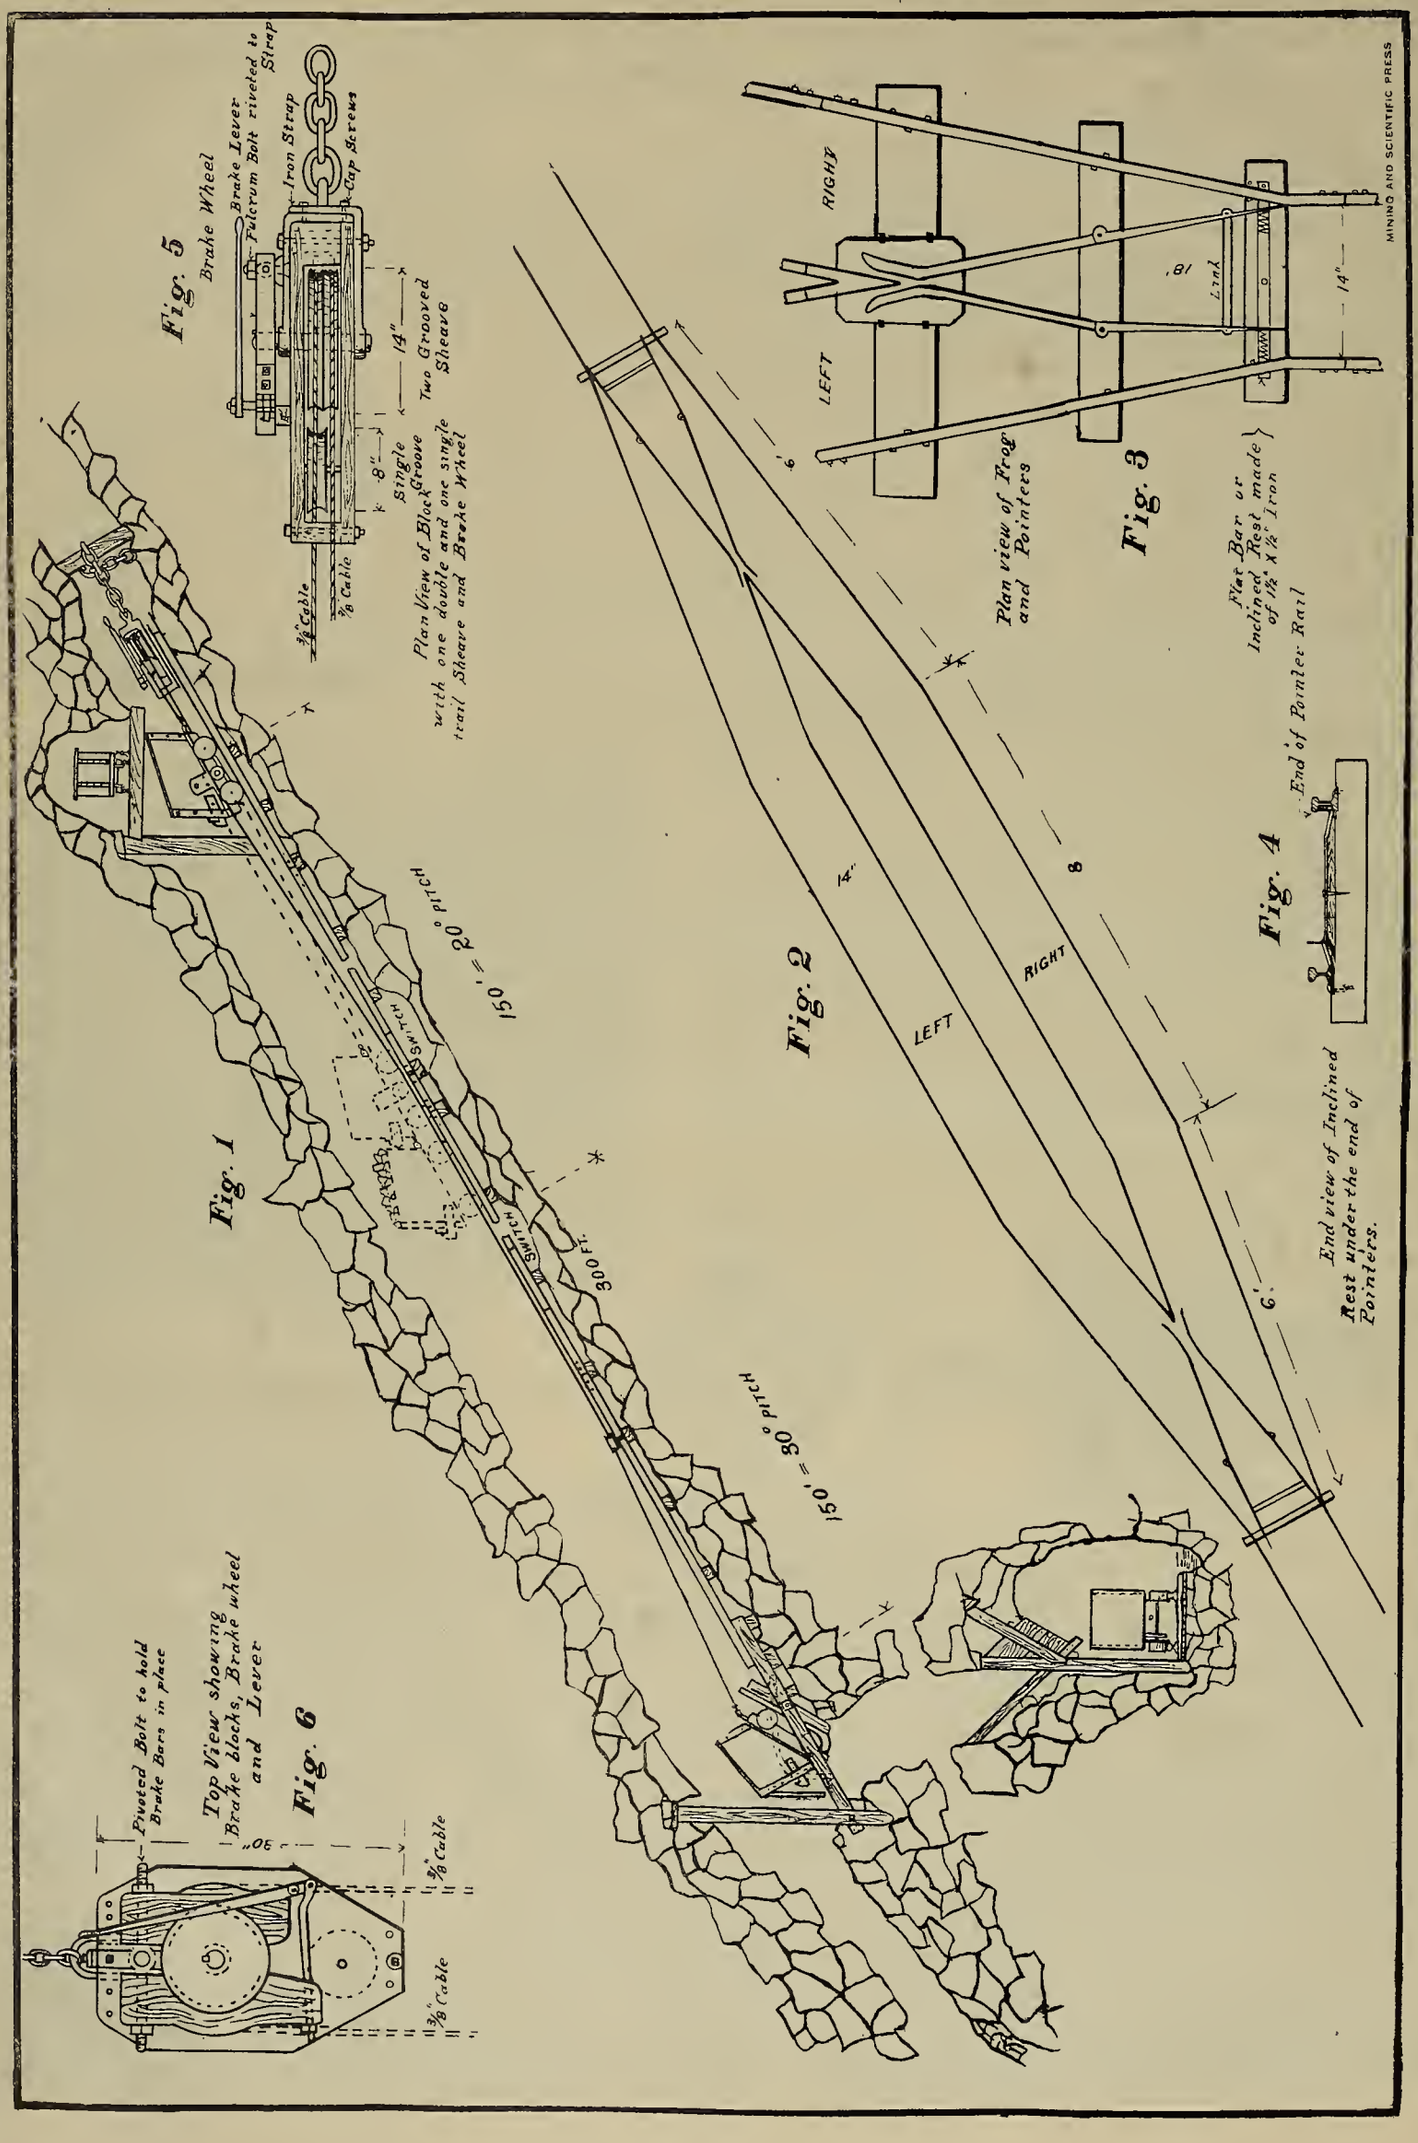
A NEW mining code has been adopted in Peru. The important points are that the ownership and use of mining property are transferable. Prospecting on unexplored lands is allowed for two years, no other person being permitted to prospect during that period on the ground granted. Mining grants measure 200 meters square, or 4 hectares. The Government tax per mine is £3 per annum, payable half-yearly.



Single Track Jig, Gold Hill Mine, Grass Valley, Cal.—(See Opposite Page).

A Single Track Mining Jig.

Written for the MINING AND SCIENTIFIC PRESS.

The sketches accompanying this description show a single track gravity tramway that has been in successful operation for over eight months at the Gold Hill mine, Grass Valley, California, of which R. Walker is superintendent.

A "raise" of several hundred feet in length, and ranging from 20° to 30° in pitch, was to be opened. It was expected that the pitch would be great enough to make it possible to remove the waste by shoveling down. It was run as small as possible, the progress depending upon the amount of waste removed, air drills being used in the face.

This way of working answered well enough for 200 or 300 feet, but for any further work in continuing the raise and running intermediate levels, the superintendent decided that some other way of handling the waste would be more economical, and suggested that a "go devil" or gravity tramway be put in, the details of which were left to C. T. Rouner, the engineer in charge.

The gravity tramways used in stoping in Grass Valley, first introduced by a Mr. Abe Hall in the Massachusetts Hill mine, are usually constructed with two separate tracks and two small cars with a sheave or small drum at the top. The cars are connected with a cable and so arranged that the loaded car going down brings the empty one up, each car keeping a separate track the entire length of the run.

As the raise already run in the Gold Hill mine was scarcely large enough for one track, two tracks were out of the question, as to make room for a double track the greater part of the raise would have to be blasted out and shoveled down, involving considerable expense and loss of time.

A single track with a short section of double track and two automatic switches midway between the bottom and top of the completed portion of the raise was deemed most practicable.

The switches were made with the common short pointers, hinged at the end, connecting with the Tee rails. They are thrown both mechanically and by gravity, which is somewhat novel, inasmuch as it is so very simple. The pointers connected by a link rest on a flat iron bar near the sharp ends (Fig. 3). A section in the center of this iron bar (Fig. 4) is raised about 1 inch, forming two inclines from the bottom of each rail toward the center, the iron bar continuing under the rails and securely nailed. These inclines are about 2 inches long. When one pointer is down at the bottom of one incline and in position to take the car wheel the other is drawn by the link a little over the top of the incline on the opposite side.

By being connected with a cable the cars must necessarily keep their own siding each time they pass, consequently the switches are shifted only when the cars approach them from the hinged end of the pointers, and only one wheel engages a pointer in passing from the double to the single tracks. This pointer being at the top of the incline and a little over 2 inches away from the rail, the gauge is narrower (Fig. 3) at this point, and the incline raising an inch high (Fig. 4) a considerable more weight comes on it than on the opposite rail. As the car advances the pointer is crowded mechanically toward the incline when it goes down by gravity snug against the rail with the weight of car, and remains there until the car passes out and returns from the single track and takes its siding when the other car throws it in the opposite direction. Both switches are shifted simultaneously each time the cars leave the sidings, opposite to each other and alternately, to connect with one siding and then the other.

To prevent the cable of the down-going car from fouling with the wheels of the up-going car an open trolley wheel is attached low down on the passing side of each car. After the cars pass and come in line on the single track the cable of the car below the siding draws taut against the side of the car above. As the cars become more distant this cable sags and drops into the open trolley wheel, which carries it clear of the car wheels to the top and back, and when the cars take the sidings this cable is lifted out, and as the cars get in line again on the single track the other trolley takes the other cable. In the general view (Fig. 1), the cars drawn in full black lines show the cars at the dump and at the head or intermediate levels. The dotted lines show the cars passing and the trolley wheel of the up-going car taking the cable of the down car.

The two sheaves at the head of the raise are made double and single, both being in the same sheath (Fig. 5). The double sheave has the shaft extended through the sheath with a brake wheel keyed on (Fig. 6). The arrangement (Fig. 5) allows the cable to be passed twice around the double and once around the single sheave, and each end of the cable attached to a car. The double turn around the sheaves increases the friction for braking on a steep incline where a single turn would slip. The points of landing and passing are always the same, and it requires a cable only a few feet longer than the run.

With the double drum at the top it takes twice the length of the run in cable, and considerable figuring is required as to where the cars are going to pass. On drums, if the cable rewinds on itself, the cars will always pass below the center, and if it winds differently on one trip than it does on another, the cars will land much out of place at the top and bottom either on a double or single track.

The cars automatically tip and unlatch the door at the bottom to spill the load in the chute, which is about 30 feet deep. The doors have the common latch bar bolted in the center, the ends engaging reversed hooks on the side of the car body. One end of the latch bar extends beyond the car body and strikes a "bumper" at the dump and unlatches the door.

A short section of the track is hooked up at the ends to receive the car wheels, and swiveled on a frame which tips with the weight of the car, giving it any angle desired. The waste is drawn from the chute and run out the lower level to the main incline to be hoisted to the surface.

A flow of over 300 gallons of water per minute down this raise made track laying and other work anything but agreeable, especially as the work was rushed and experimental. With the able assistance of R. Barry, the foreman, the tramway was put in and working successfully in the short space of two days time.

While the single track will probably never succeed the double track for this kind of underground mining, there are times when, under the same conditions that confronted the Gold Hill mine, this mining jig could be used to a great advantage.

Reviving the Tombstone, Ariz., Mines.

[STAFF CORRESPONDENCE.]

The Tombstone Con. Mines Co., E. B. Gage president and W. F. Staunton general manager, now control the principal mines of the Tombstone district, including the Grand Central of twenty-six claims, the Contention of four claims, the Tombstone M. & M. Co. of eighteen claims, Head Center and Tranquility of four claims and ten other locations. This is claimed to take in about 90% of the properties that formerly produced.

The plans of the management contemplate the installation of a pumping plant at the new combination shaft, now at 569 feet depth, which is water level, then sinking into the ore bodies below water level to determine their character and extent. This new shaft is four-compartment, and pumps of 1700 gallons capacity per minute will be placed at the water-level station. They are to be tandem-compound-triple-expansion. Power will be furnished by four marine type boilers, 22½ tons each, with an 8-inch steam pipe connecting them with station pumps. The 16x60 hoisting engine at the Grand Central shaft is being moved to the new shaft to do the work there. It is the double-reel type, carrying flat cable. The new machinery, including pumps and an air compressor, is expected to be on the ground within a few weeks.

The new combination shaft is on the Flora Morrison ground, near the old Contention shaft, cutting to water level through shale and quartzite. Connections have been made with old workings of contiguous property. The holdings of the consolidation extend along the strike of the north and south belt, carrying parallel ledges which widen and narrow at different points. The vein matter consists of quartz, shale, spar and clay, the pay ore being the shoots, chimneys and chambers. The values are in silver chlorides, free gold and some lead. In the operations of former years the high grades were shipped direct to the smelters, the lower grades milled by free-milling process, the several mills being near the San Pedro river, 9 miles away. The presumption is that the ores below water level will be found to be more of a sulphide in character. The veins of the camp are pretty well opened to the 300-foot level.

When the new company's pumping and hoisting equipment shall be ready for operating, the developments and determinations (of so much importance to Tombstone) will go on rapidly. If the operations and production go forward as expected, it is likely that a railroad will be built to Tombstone. General Manager Staunton spends most of his time at the Congress mine, of which he is also manager; but it is stated that President E. B. Gage will soon be in Tombstone to give the work much of his personal attention. H. J. Gray is Supt. in charge and W. H. Trelease of Oakland, Cal., is directing the mechanical work.

Tombstone, Ariz., Jan. 6.

Copper Statistics for 1901.

Statistician John Stanton announces his copper figures of United States production and exports for 1901, and their comparison with the corresponding figures for 1900 as follows:

	1901.	1900.
U. S. production, pounds	594,171,200	602,082,880
U. S. exports	213,619,840	357,530,880
Home supplies	380,551,360	244,552,000

Reduced to a percentage basis we have:

Decrease in U. S. production	1.3%
Decrease in U. S. exports	40.3%
Increase in home supplies	55.6%

The European production of 1901 at 224,539,840 pounds was the largest on record, and was an increase of 12% over the figures of 1900.

Cement Production in the United States in 1900.*

The amount of Portland cement produced in 1900 increased over 50% over 1899. The average annual rate of increase since 1890 has been about 40%. The value of the product of 1900 was about $1,200,000 more than in 1899. The average price per barrel in 1900 was $1.09, against $1.43 in 1899. There were fifty cement works in 1900, against thirty-six in 1899, twenty-four in 1894 and sixteen in 1890. Pennsylvania and New Jersey remain the chief States of the industry in the country; Illinois and Michigan are making considerable progress; Colorado, Indiana and Texas have the industry on a good basis.

The imports have remained practically constant for the past eleven years, in the face of the immense growth of domestic manufacture. High-grade Portland cement is manufactured more cheaply and of better quality in this country than abroad. The proportion of domestic cement consumed has increased from 13.2% in 1891 to 73.9% in 1899 and 79.1% in 1900. According to the advance sheets of consular reports No. 1052, there is apparently good demand for Portland cement under conditions favorable enough to allow export from this country to Canada, Mexico, Central America, Martinique and the Guianas.

The production of natural rock cement in the United States during 1900 amounted to 8,383,519 barrels, practically the average for the last five years, a loss of 14.9% in amount and 22.55% in value from 1899. The average price per barrel in 1899 was 48.3 cents, and in 1900 it was 44.5 cents. There is a vast field for improvement in the natural cements of this country, and manufacturers of this kind of cement are urged to institute a series of experiments with their raw materials and faithfully to record their results.

The total product of cement in the United States in 1900 was 17,231,150 barrels, valued at $13,283,581, against 15,520,445 barrels, valued at $12,869,142, in 1899, a gain of 11.02% in amount and 3.06% in value.

*"Mineral Resources of the United States, 1900," Dr. David T. Day, chief of division, issued by United States Geological Survey.

Difficult Shaft Sinking, Emma Mine, Butte, Mont.

The reports of A. E. Spriggs, superintendent for the Butte M. & Dev. Co., and in charge of operations at the Emma mine, at Butte, Mont., describes in detail the means taken by him to save the Emma shaft, which threatened to cave in on account of the soft, sliding ground through which it was sunk. In his first report he says: "It has occupied seventy-five days to sink the shaft 16 feet, repair and strengthen shaft, cut a station 14x26 feet, install pumps thereon and run 200 feet of crosscuts and drifts, at an expenditure of almost $11,500."

In his later report, which carried the work up to the first of 1902, he says: "The system of spiling and double setting was continued, using spiling 4x6 inches and 12 feet long, driving them by compressed air, and Oregon fir timbers 12 inches square for the sets, forcing them into place with hydraulic jacks, and tying them firmly together with extra heavy Norway iron hanging bolts. With no solid ground to block timbers to below, all the down weight had to be protected from above, and tons of Norway iron were made into hanging bolts with which to tie the timbers together. The ground that did not come up through the pumps as sand, had to be taken out with extra caution, for, if it got away for a second and made a run, the shaft was lost, and as fast as a shovelful of dirt was removed, timbers in some form had to take its place. This work, of necessity, was very slow. The shaft timbers also required constant attention, as the loose surging ground above would crush in the wall plates, and false ones had to be substituted immediately."

Solid ground was finally reached in the shaft on Dec. 16. "The cost of this undertaking," he adds, "has been very heavy. It has occupied 112 days' time to sink 37 feet, retimber, repair and strengthen the shaft, cut a station 14x26 feet, install a pumping plant therein and run 230 feet of drifts and crosscuts at an expenditure of nearly $16,500. The last 30 feet sunk has cost about $74 per foot. I consider $75 per foot a fair estimate for sinking the remainder of the shaft."

THE specific gravity of commercially pure aluminum varies at atmospheric temperature from 2.56 when cast in sand to 2.71 when hammered or drawn. Compared with other metals, its specific gravity is as follows:

Aluminum	1
Zinc	2.7
Tin	2.76
Cast iron	2.91
Nickel	3.37
Copper	3.37
Silver	3.98
Lead	4.30
Gold	7.31
Platinum	8.15

The extraordinary lightness of aluminum is one of its most striking characteristics. Since the weight of a given volume of a metal may govern its financial value, copper being 3.37 times as heavy as aluminum, it follows that whenever aluminum costs less than 3.37 times copper, it is cheaper, volume for volume.

What to do When the Gas Engine Stops.

By Albert Stritmatter.

It is always very easy to solve a problem in mathematics backwards after you have the answer. Likewise it is very easy to explain difficulties in connection with machinery after you have the cause and how to overcome it. The hard part is when you have the difficulty to overcome and do not know what the cause is or how to find it. Meanwhile the whole or portion of the plant may he shut down and expenses are going on while no work is being done, men are continually coming to ask what the trouhle is, etc. Under such circumstances it takes a cool head to keep one's brain working properly, for everything is in confusion and tends to make one nervous and excited, preventing a solution of the prohlem. On many such occasions further damage is done by reason of not investigating fully the cause of the trouble but guessing at it and then going ahead, with the result that something more serious occurs.

When it is a gas or gasoline engine that is causing the trouhle it is particularly essential to ultimate speed and success in overcoming the difficulty that the work of locating the trouhle he carried on in an intelligent and methodical manner. If it is not done so, the solution of the question will not he discovered unless accidentally. How foolish it is, for instance, when an engine will not start, for a man to lug at it over and over again for hours at a time in a vain attempt to start the engine without undertaking to use his own brains and find out why it does not start. Yet this is done very frequently and the engine is presented as heing a very hard one to start! I should think so. It should not he necessary for a man to go from the factory anywhere from ten to several hundred miles, simply to tell a puzzled engine operator to renew his hatteries, to replenish his gasoline tank, take a brick off his gasometer, to use more or less gasoline or lubricating oil, or to repack his gasoline pump, etc. Yet this has been done many times and is heing done continually for all these and many other equally as foolish reasons. And to cap the climax, in almost every instance the operator has had and has been supposed to read and study a book of instructions giving particular cautions on these various subjects.

Let us suppose we have an engine which has suddenly stopped running. We are sensihle and know that the engine has done so because of some legitimate reason, and so we will not lug at the fly wheels in vain or telegraph for a man from the factory the very first thing, meanwhile sitting around and cursing ourselves for ever having allowed ourselves to be persuaded into buying such an engine. We will sit down and think a little about how the machine operates.

First, we know that the engine must have fuel in sufficient quantities and in the proper proportions. By fuel we know is meant not only gas or gasoline but also air, for air is as essential to proper results as is the gas or gasoline. Second, we know that after the fuel is drawn into the cylinder it must he properly compressed to give greater power and assist in rapid comhustion when the charge is ignited. Third, we know that the compressed charges must be ignited, and fourth, we know that the hurned charge must be exhausted. Whatever interferes with this process will result in stopping the engine entirely, or at least in decreasing its power and increasing the fuel consumption per horse power actually developed. Besides the process mentioned we know that the engine must be properly lubricated, adjusted, have a proper cooling system, etc., in order to perform its functions with the greatest economy.

Let us see, then, whether our engine is getting the proper supply of fuel. First, we will work our gasoline pump by hand and see if plenty of gasoline reaches the engine. If it does not, there may be no gasoline in the supply tank, the suction pipe may not be air tight, the check valves may not seat properly, or the pump may need repacking. But even if the gasoline reaches the pump it may not get into the cylinder of the engine. There are a great many devices for this purpose and each may cause peculiar troubles of its own. The operator should understand his device thoroughly and see that it is kept clean and in proper condition so that its operation will be perfect.

If we have a gas engine, we will see that our gas meter, gas hag or gasometer, gas regulating valves, etc., are in proper condition. Too small a meter may cause trouhle. Sometimes a man will take a gasometer to pieces and put it back so that it shuts when it should open, and vice versa.

Then we will see if our air supply is all right. There are different methods of supplying air to engines. Sometimes they draw air from under the hed, sometimes through a long pipe from the outside of the building. In the latter case obstructions are apt to get into the pipes unless the end of it is protected. In one case a newshoy's hat was sucked into the pipe and stopped the supply of air.

Feeling sure, now, that our engine is supplied with gas or gasoline and air in sufficient quantities, we must be sure that the quality and proportion are right. Water in gasoline causes a great deal of trouble. Gasoline which has been allowed to stand and let the lighter and more inflammahle gases evaporate also causes a great deal of trouhle. Gas which has been too liberally supplied with air, either intentionally or otherwise, will cause difficulties, as will water in the gas supply pipes. Then the proportion of the gas or gasoline to the air must he correct. This is governed hy various devices and the instructions from the manufacturer should give sufficient information on this suhject to enable the operator to make these adjustments properly. The color of the exhaust will indicate pretty clearly whether a proper proportion is being secured. The exhaust will he practically smokeless when the proper mixture is secured. Smoky exhaust indicates improper comhustion and results from too much gas or gasoline or from too much lubricating oil.

If we have not located the trouhle yet we will try the compression. By pulling hack on the fly wheels and holding against the compression a few minutes, we can tell whether or not it is all right. If it is not, it may he due to several things. Some of the piston rings may he broken. Or they may he stuck fast into their grooves as a result of too much luhricating oil, and thus fail to hold the compression. Or, the piston and cylinder may be worn to such an extent that it is impossihle to get a good compression. Or the exhaust or fuel valves may fail to come to their seats properly, which may be due to their needing regrinding, or because the valve stems are stuck with burned grease and oil. The valves should he reground to their seats with emery flour and oil, and the stems and hearings in which the stems work should be thoroughly cleaned up. Or, the lever or other devices opening the valves may be so out of adjustment that the valves are not permitted to come clear down to their seats. The power developed hy an engine depends to a very large extent on the compression, so that this is a very important point. As the highest pressure developed hy the explosion is approximately four and one-half times the pressure of compression, it will be seen how vitally the compression affects the results secured.

Having a proper fuel supply and a good compression, we now come to the question of ignition. This is a very extensive question and one of vital importance to the gas engine operator. Space will not permit in this article a detailed discussion of the question. Instruction hooks of manufacturers generally devote considerable space to this suhject and it will pay the operator to become as familiar with the suhject as possihle, for his knowledge of this question will determine the success or failure of the engine. The batteries, of course, must be strong, the connections from cell to cell and from hattery to engine must be properly made. The spark coil must be kept dry. The igniter points must he clean and make a perfect contact. The igniting mechanism must he operated at the proper time and in a proper manner. This applies to all kinds of electric igniters. If a tuhe igniter is used, the tube must he of proper length. If it is iron, it must not he allowed to remain until it is oxidized too greatly on the inside.

The igniter of a gas or gasoline engine is frequently referred to as its "soul," which indicates how important it is. There is, however, a very close connection between the spark or flame and the charge of fuel. Frequently when ignition does not take place a great deal of time is spent in tinkering with the igniter or the batteries while the real trouble may be in the charge of fuel. As has been mentioned hefore, gasoline which has water in it will cause no end of trouhle. While the oil companies, of course, deny diluting the gasoline with water, and the dealers or retail stores just as persistently claim that they are not guilty, it is frequently done hy some one. It can generally he discovered hy spattering a little of the gasoline with your finger onto a flat piece of iron or something of that kind. If there is much water in it, there will be little glohules of the water which will separate from the gasoline. Otherwise, the gasoline will spread out smoothly all over the iron. While this does not always disclose the presence of water in gasoline, it will frequently do so. This is a difficulty which it is often very hard to locate because the mixture is apparently all right, as is also the compression and the spark, and yet the engine will not ignite.

Many people, too, see no reason why they should not connect call bells, etc., to their engine battery. This may be successful for a while but will result in the battery giving out much sooner than it otherwise would, the result being that they have to he renewed more frequently. It is much cheaper in the end to provide separate hatteries for call hells and let the gas engine battery serve for the one purpose of igniting the engine charges. It should also be remembered that the hattery should not he put on a shelf and tin cans and other ruhhish piled on top of it. If this is done trouhle will result from short circuiting the battery.

Another thing to be remembered in renewing "wet" batteries is that new solutions as well as new plates should he put in. Frequently people will put new solutions onto old plates, or new plates into old solutions, with the result that no good is done. Battery manufacturers usually arrange the quantity of the various parts of their cells so that they deteriorate together, and it is therefore useless to renew only a portion of them. Ahove all, do not forget to open the switch when the engine is not in operation. Failure to do this results in wearing out the hattery more in a single night than for many months of continuous use.—American Manufacturer.

Mining at Bisbee, Ariz.

[STAFF CORRESPONDENCE.]

The Bisbee copper belt has a northwest and southeast trend within a lime formation, hut adjacent to a well-defined porphyry dike, which also strikes northwest and southeast. The ore hodies within the lime helt have an irregular shape in many places, resulting, apparently, from intrusions of porphyry from the main dike. The depositions of copper apparently were made in the contact hetween porphyry and lime, chiefly penetrating the latter. The strata which are thus mineralized pitch toward the southeast. This is proven to he true by the workings at different points along the strike of the helt. For instance, in the Copper Queen's Czar shaft, near the smelter, the ore was reached at about 200 feet depth, and the ore was struck at greater depth in each consecutive shaft as development proceeded southward along the helt.

On the Calumet & Arizona group of eleven claims,

Prospecting Rig Copper Glance Mine, Near Bisbee, Arizona.

adjoining the Copper Queen proper on the southeast, the main ore hody was opened at the 750-foot level. On the Lowell group, still southeast of the Calumet, the ore was reached at 1050 feet depth. Thus there seems to be a non-mineralized lime capping overlying the main ore hody, though there are croppings of ore at various points.

The most important development on the helt south of the Copper Queen is that of the Calumet & Arizona, which has a vertical shaft 1120 feet deep, with drifts from it into the ore body at the seventh, eighth and ninth levels, in all aggregating ahout 2 miles of work, exposing large bodies of ore that will average at least 7% copper. The bulk of this ore belongs in the oxidized class, being carried in an altered lime, and associated with talc, oxide of manganese and hematite, the manganese making a desirahle fluxing material. There are some sulphides on the ninth level and from the tenth down the shaft is in a good grade of chalcopyrite ore. In many places there are copper oxides that run very high, and on the eighth level copper glance was found that ran 41% copper.

A pump will soon be installed at the 1100-foot station to keep the work clear of water. At the surface a first-motion, double-drum hoisting plant and a duplex compound air compressor are being put in,

and a third compartment is being added to the shaft. It is intended to put in a triple-deck cage.

Supt. I. L. Merrill states that the Calumet & Arizona Co. will erect a 300-ton smelting plant at Douglas, 26 miles southeast of Bisbee, on the El Paso & Southwestern Railway, and that the equipment for it has been ordered. The plant will be enclosed in a steel structure of sufficient size to hold a 500-ton smelter. At Douglas the water supply from wells is said to be ample for all purposes.

The Lowell, lying south of the Calumet, now belongs to the Copper Queen Co., who are thoroughly developing the large bodies of oxidized and sulphide ores that were uncovered some time ago between the 1000 and 1100-foot levels.

Immediately southeast of the Lowell is a group of nine claims, believed to be on the same belt, which belongs to and is developed by the Calumet & Pittsburgh Co., comprising the same persons that control the Calumet & Arizona.

The porphyry dike which cuts through the Bisbee lime belt is believed to be traceable several miles in a southeasterly course. At any rate, there is development in progress at and around Bald mountain, 7 miles southeast from Bisbee, where there are fine showings of copper in lime, porphyry and quartz-conglomerate. A great deal of the ore here is copper glance, being specially visible in the porphyritic rock and quartzite which form the outcropping dike. Adjacent to this, in the lime, the croppings and shallow workings disclose a good deal of oxidized copper ore, as well as glance. This portion of the belt is covered by twenty-four claims belonging to the Copper Glance Co., organized by Bisbee people—C. W. Clawson, I. L. Merrill, C. C. Warner, C. L. Beckwith, James Wood and G. E. Tomlinson being interested. The locations were made nine years ago by John Connolly, who is a stockholder. Six or eight shallow shafts have been sunk and a large number of open cuts made, which show a wide dissemination of ore through the belt. One prospecting shaft, illustrated herewith to show the simple rig used in such work, is in conglomerate and lime, the idea being to crosscut from this to the main ore body. This camp is near Glance station, on the El Paso & Southwestern Railroad.

Adjoining this group are the seventeen claims of the Bisbee Consolidated Copper Co., located on the same belt and having practically the same conditions.

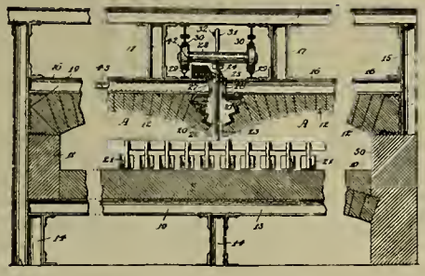
Bisbee, Ariz., Jan. 4.

Mining and Metallurgical Patents.

Patents Issued January 28, 1902.

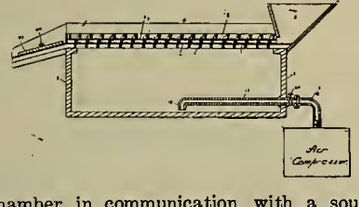
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROASTING FURNACE.—No. 691,787; W. A. Lorenz, Hartford, Conn.



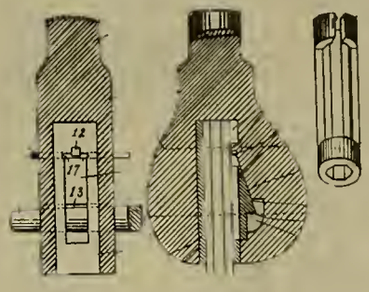
A roof composed of a plurality of arches which are separated from each other by a slot extending longitudinally of furnace; I-beams disposed above each section, thrust members secured to beams, for independently supporting each section from said beams; girders extending laterally of furnace; means for supporting I-beams from girders; means for supporting girders near ends thereof; a stirrer mechanism having an arm projecting through slot into hearth; and means for moving mechanism longitudinally of hearth.

ORE SEPARATOR.—No. 691,819; J. J. Snider, Xenia, Ohio.



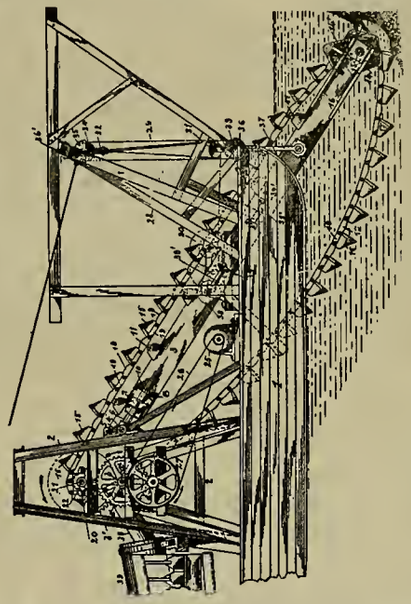
A chamber in communication with a source of pressure, a supporting frame across top of chamber, a perforated bed or covering on frame, a series of diagonally-arranged strips above covering, and a second series of oppositely arranged strips above first leaving a horizontal channel between lower strips extending from side to side throughout length and width of frame, while upper strips extend throughout width of upper half of frame and only partially of width of lower half.

ROCK DRILL CHUCK.—No. 691,985; W. Terry, Oakland, Cal.



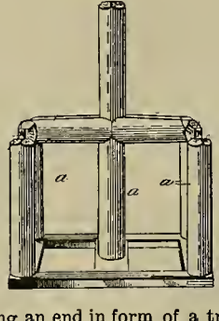
A chuck having an axial socket or cavity for drill bit and having a downward extension with a surface sloping upward rearwardly, a shell or sleeve fitting in socket, a block in lower part of socket and having a rear upwardly sloping lower surface to slide on sloping surface of extension and act as a wedge, chuck being also apertured transversely through extension block having a shoulder extending into aperture, and a wedge or key in transverse aperture engaging shoulder to shift block rearwardly and thereby clamp drill bit, chuck being also apertured transversely in rear of rear end of block whereby a suitable pointed instrument may be inserted to remove or loosen same.

EXCAVATING MECHANISM FOR DREDGERS.—No. 692,030; R. H. Postlethwaite, San Francisco, Cal.



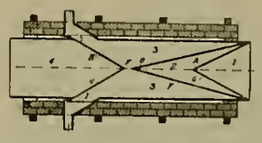
The supporting frame, ladder pivoted thereto, tumbler working within bearings of supporting frame, means for imparting rotation to tumbler, roll or drum working in bearings at lower end of ladder, endless carrier working over roll or drum and tumbler, excavating buckets secured to and carried by endless carrier, a series of fingers projecting from tumbler and between which endless carrier works, of devices for imparting longitudinal movement to supporting ladder so as to regulate tension of endless carrier, guard plates attached to lower end of side pieces of ladder, and means whereby supporting ladder is raised and lowered.

MINE TIMBER.—No. 692,111; D. W. Brunton, Denver, Colo.



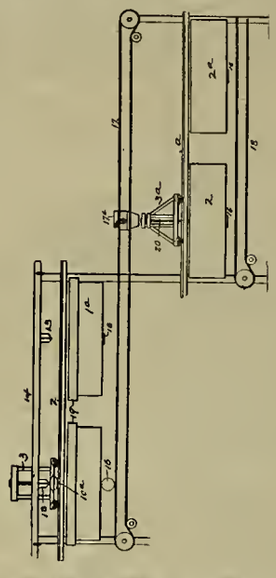
A post having an end in form of a truncated pyramid, a cap also having four inclined sides and a tenon provided with top and bottom and shoulders, and a girth also having four inclined sides and a tenon having top and bottom, sides of these three members and tenons being capable of being cut by appropriately feeding timbers to a gang of fixed saws appropriately arranged.

GRAVIMETRIC ORE ROASTER.—No. 691,868; J. A. Ogden, Philadelphia, Pa.



A furnace, an inclined, freely swinging roasting plate situated in furnace, provided with a superimposed concentrating plate secured to and moving with roasting plate but separated therefrom, a V-shaped bridge upon concentrating plate, an outlet near lower part of V leading through concentrating plate to roasting plate, means for swinging plates toward higher end of plates, and abutments placed to stop suddenly swing of plates in other direction.

APPARATUS FOR HANDLING TAILINGS.—No. 692,108; H. W. Blaisdell, Yuma, Ariz.



Two series or sets of vats disposed in different planes, traveling bridges located above each set or series of vats, a distributer for tailings carried by upper bridge, a combined distributer and excavator for tailings carried by lower bridge and means for carrying material from upper series of vats to lower.

SEPARATING PROCESS FOR ORES.—No. 692,008; O. Frolich, Charlottenburg, M. Huth, Halensee, and A. Edelmann, Charlottenburg, Germany.

The process which consists in heating ore to a temperature below decomposing temperature of sulphate of metal to be sulphated, but above decomposing temperature of any other metal existing in ore and then passing over it a heated and dry mixture of sulphur dioxide and air, then separating resultant sulphate and repeating above steps for another of metals and so on, then leaching ore with water and repeating above steps for another of metals and so on.

PROCESS OF RECOVERING ZINC FROM SULPHIDE ORES.—No. 692,148; H. F. Kirkpatrick-Picard, London, England.

Mixing the unroasted ore containing zinc with a basic material capable of combining with sulphur, and carbonaceous material suitable for coking, forming mixture into briquettes and distilling briquettes in such conditions that they are first coked into coherent masses, and finally zinc is reduced and volatilized, while resulting sulphide is retained in minute particles throughout coke.

A DISCOVERY of gold-bearing conglomerate is reported as having been made in Indian creek, near Dawson, Yukon Territory. There is no reason why gold-bearing conglomerate deposits should not exist in the Klondike country. The extravagant claims of extent of the deposit are not, however, to be accepted. While conglomerate beds containing gold can have a considerable superficial extent, the knowledge of their mode of origin is sufficiently exact to state with certainty that a few feet is the limit of possible depth of payable values. Any first report of a mining discovery from the distant north must be accepted with reserve. In no case are the first examinations of original discoveries as complete and comprehensive as the reporters of them and the writers of newspaper headlines declare.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

COOK'S INLET.

F. E. Dowling, manager of the Aurora G. M. Co. of New York, which is operating on quartz properties at Aurora, on Cook Inlet, says of the mines that they consist of eight claims, on which sufficient development work has been done to justify a 20-stamp mill, which will be installed this summer. The mill will be operated in the summer by water power and during the winter by steam power. The ore they are taking out now yields about $15 a ton. During the past year they have constructed a dock near the property and installed a number of other improvements and it is contemplated to put in a smelter.

KETCHIKAN.

Work on the Laskawonda G. & C. M. Co.'s property at Ketchikan is progressing under Supt. Shoenhar. The shaft is going down in the ore body, which it is claimed shows improvement with depth. The deposit is of large size, some of it carrying high values in gold and copper. Col. Shoenbar goes to the States soon to buy a large dynamo and suitable hoisting machinery, which he hopes to install in May.

The Valparaiso G. M. Co. at Dolomi, Prince of Wales Island, recently shipped fifty-four tons of ore which yielded something over $14,000.

KOYUKUK.

Advices from Rampart give good accounts of the new Koyukuk district, of which Beetles City is at present the center. From Nov. 12 to Dec. 2 the population of Beetles is stated to have jumped from 300 to 700 people. Stampedes to outside creeks and newly discovered ground were of daily occurrence. Provisions were short and food was also short at Rampart. Four creeks in the district are noted as giving rich returns. They are Lane, Olson, Hoglund and Glen. One miner on Glen creek is said to have picked out a nugget weighing $601, and other men are taking out pans running from $1 to $70.

ARIZONA.

GRAHAM COUNTY.

C. M. Shannon of Clifton, the original owner of the property now owned by the Shannon Copper Co., sold it to the company in 1899, and since then the mine, which altogether comprises forty claims, has been extensively developed. The smelter plant is expected to be in operation by April. The plant at the start will treat on an average of 350 tons of ore daily with both furnaces going, and the product for the current calendar year should be about 8,000,000 pounds of refined copper. Later, when the converter and concentrators are added, a tonnage of 700 tons daily will be treated, expected to bring the product up to 20,000,000 pounds per annum.

MARICOPA COUNTY.

At Wickenburg the Oro Grande M. Co. will install an 80-stamp mill. The Socorro M. Co. is now putting in a 20-stamp mill. The Sahuaro is sinking. Work has been started on the Lorna Doone by London capitalists who recently secured that group. The company having the Angel group are working away and are making arrangements to install a 12 H. P. gasoline hoist.

MOHAVE COUNTY.

Control of the Gold Roads group of gold mines near Kingman, lately bought by C. K. McCornick and associates of Salt Lake City, Utah, has been sold in Paris, where the company will be reorganized. G. Kislingbury is superintendent at the mine.

SANTA CRUZ COUNTY.

F. N. Cox, Supt. of the Buena Vista M. Co.'s properties near Nogales, says eighteen men are employed, and there are now some 750 feet of tunneling completed, exposing ore bodies. Electric drills are to be installed and sinking started.

The Pena Blanca M. Co., near Nogales, has ordered a new 12 H. P. gasoline hoist with a capacity for sinking 500 feet. J. S. Hurst, manager, states that the shaft, now down 100 feet, will be sunk 500 feet.

Vance, Carothers & McDonald have leased the Hermosa mine and mill at Harshaw and have started work on the mine, on which they propose to do development work.

YAVAPAI COUNTY.

The Hurricane group of mines in Copper basin, near Prescott, has been sold by D. Walker and S. H. Anderson to L. D. Philips, representing Douglas, Lacy & Co. The Hurricane is a gold group, carrying, it is claimed, about $17.50 gold and eleven ounces silver per ton and 3½% copper. There is a 40-foot shaft and three other openings along the vein. The purchasers, it is stated, will commence immediate development work on an extensive scale.

The Copper Basin G. & C. M. Co. of Prescott owns a group of seventeen claims near Prescott. W. W. Munds is president and superintendent and C. E. Snider is secretary. The company has constructed a hoarding house, two hunk houses, a blacksmith shop, a shaft house and a whim. On the mines over 300 feet of development work has been done, the new working shaft being down 85 feet, and other shafts varying from 30 feet down to 10 have been sunk.

Work on the Brooklyn mine, near McCahe, has developed a fine body of free milling gold ore. The Brooklyn M. & M. Co., of which A. V. Miller is president and superintendent, has in opening up the mines sunk the main shaft 170 feet and has drifted 300 feet in ore. The company has bought a 10-stamp mill, engine, boiler, ore crusher, etc. Water for milling will be pumped from the mine.

A strike is reported made in the properties of the Monarch G. & C. Co., near Jerome. The mine is a free gold proposition, and at a depth of 350 feet a drift cut 4 feet of ore, which assayed $28. The strike was made in the Eclipse claim. There is a large tonnage of ore in the bins ready for the mill, which is nearly ready to start up.

A strike has been made in the Mineral Belt mine, in the Harrishurg district, west of Martinez. The property is owned by the Arizona Development Co., O. L. Gier manager. At 500 feet down a body of ore has been crosscut 28 feet wide which assays from $10 to $15 per ton.

CALIFORNIA.

AMADOR COUNTY.

A new compressor has been installed at the Shenandoah mine, near Plymouth, of which S. K. Thornton is Supt. The shaft is now down about 500 feet, with sinking for the 1000-foot level in progress. Power drills are to be installed soon.

The new shaft on the Boot Jack mine at Plymouth is down 100 feet on an east and west ledge, the development showing up well.

On the Plymouth Rock, formerly the Price mine, 3 miles north of Plymouth, J. H. Durst Supt., there are several veins. Mr. Durst has started to crosscut the formation by running a tunnel through the claim, and is now in about 300 feet. It is expected to crosscut the various croppings at a depth of less than 200 feet below the surface.

BUTTE COUNTY.

J. C. Gray of Oroville has lately discovered a gold mine on his farm in the midst of a peach orchard. The ledge is about 4 feet wide and an assay shows the ore to go $68.31 per ton.

CALAVERAS COUNTY.

The development in the Moon copper mine at Buena Vista, at a depth of 45 feet in the shaft, has opened a vein of ore that assays $21.60 to the ton in gold, silver and copper. At the annual meeting of the Moon G. M. Co., at Valley Springs, W. H. Mitchell was elected president, Bank of Amador treasurer and W. Holmes secretary. The directors determined to sink 100 feet by contract, and called for bids for sinking the next 50 feet.

EL DORADO COUNTY.

On the Montezuma mine at Nashville, on the Mother Lode, the 10-stamp mill is running on rich rock from the 300-foot level. The seam near the hanging wall in this mine, it is claimed, will run $30 to the ton. The ledge, which is about 4 feet wide, will average nearly $9 a ton.

A. Harpending, manager of the Union mine near El Dorado, is preparing to start up and has made an arrangement to work from the Church mine by drifting on the lower level of the latter toward the Union mine.

KERN COUNTY.

Supt. McMahon reports the latest cleanup of ore from the Butte lode at Randsburg, worked at the Red Dog mill, as $8750 from 103 tons, an average of about $85 per ton. Four-fifths of this ore came from the development work in the new drift, the remainder from the lower workings in the Philadelphia Wedge, the property immediately adjoining and which the Butte Co. recently bought.

MARIPOSA COUNTY.

The Mariposa Electrical & Power Co., whose works are to be on the Merced river about 9 miles above the Benton Mills, propose to begin the construction of a dam at once for the purpose of securing power to operate an electric power plant. The dam is to be constructed of solid masonry and concrete and will be 30 feet high. The flume will be 7 miles long, 12 feet wide and 6 feet deep. The water turned in at the headgate will be carried to a power house 2 miles above the Benton Mills and used there under a head of 275 feet, which will operate a generator of 3000 H. P. The flume will cross Sherlock creek near its mouth, and a steel and iron trestle 200 feet high and 900 feet long will be built there. The cost of construction of the dam and flume is estimated at $750,000.

A new station has just been finished at the 1250-foot level in the Princeton mine shaft at Princeton. The station is 30x30 feet and 16 feet high, with a shoot 25 feet deep which is 20 feet across the top. Eight men were employed on this work for twenty-eight days. The quartz taken from the station, it is stated, more than paid the expenses of the work of excavation. The mine is operated by the Mariposa M. & C. Co.

NAPA COUNTY.

The statement of the Napa Con. Q. M. Co. for 1901 shows: Total cash disbursements, $163,154.36; total payroll, $138,390.98; ore mined and treated, 33,930 tons; quicksilver produced, 4800 flasks, 367,200 pounds; average yield, percentage, .00541; cost per ton of mining ore, $2.82; cost per ton of mining ore, including development work, $3.50; cost per ton of mining ore and reduction, including general expense, $4.60; cost per ton of ore reduction, 66 cents; amount of tunnels, drifts and winzes excavated by contract, 9488 feet; cost per foot, $2.43.

The statement of the Ætna Con. Q. M. Co. for 1901 shows: Total cash disbursements, $16,867.83; total payroll, $11,598.60; quicksilver produced from cleaning furnaces, 228 flasks, 17,442 pounds; tunnels and drifts excavated, new work, 1995 feet; old tunnels opened, 4384 feet; old winzes opened, 83 feet; cost per foot for new work, $4.97; cost per foot for opening old works, $1.05. The quicksilver produced was all from cleaning up condensers, no ore being mined or treated during the year. The mine work has been entirely for development to open up new ore body discovered through shallow surface workings.

The statement of the Boston Q. M. Co. for 1901 shows: Total cash disbursements, $83,383.55; total payroll, $61,420.39; ore mined and treated, 19,045 tons; quicksilver produced, 1545 flasks, 118,192½ pounds; average yield, percentage, .0031; cost of ore reduction per ton, 61 cents; cost of mining per ton, $2.14; cost of mining per ton, including development work, $2.58; amount of tunnels, drifts and winzes excavated, 2507 feet; average cost per foot development work, $2.50; reopening and timbering old works, 871 feet. A new furnace was completed and put into service, the old furnace having been closed down to be repaired during the coming year.

NEVADA COUNTY.

Manager Mark B. Kerr of the Grass Valley Exploration Co. says that ore averaging not over $3.50 a ton will be worked at a profit at the W. Y. O. D. mine during the current year. At present the cost at the mine of mining, milling and administration is $4.35, against $3.85 for the same time last year. The additional expense is on account of long hauls and extra handling of ore in the Crescent "go-devil" raise. The semi-annual cost sheet of the W. Y. O. D. mine of the Grass Valley Exploration Co. shows the following results from August 1 to December 31, 1901:

Mining, per ton	$3 43
Milling, per ton	64
Office and administration	28
Development	1 13
Total	$5 48

At the Federal Loan mine in Willow Valley, near Nevada City, the miners who have a lease on the property have made an upraise from a drift off the 300-foot level into a bunch of high-grade ore, which shows free gold. The lessees will start the mill and crush the ore. The shaft at the Federal Loan is about 800 feet in depth.

Whilden, Hawke, Cleveland, Marowich & Calanan have taken a lease of the Tilley mine, Nevada City, and have commenced operations. The Tilley mine was formerly called the Midnight mine, and for the past few years has been worked by tributers in surface workings.

C. Brockington, Supt. Orleans M. Co., Nevada City, says that he has struck the Heuston Hill vein, and pay rock has been encountered. The drift will be continued 100 feet, to connect with the old Heuston Hill property, which will give them 300 feet of backs.

Supt. Bray reports that at the Posey mine in Willow valley, near Nevada City, a good ledge has been struck at a depth of 140 feet.

W. Floyd and F. Searles of Nevada City, owners of the Santa Rosa claims on Canada Hill, and W. H. Bray, Supt. of the Posey mine in Willow valley, have made an agreement by which the three will develop the Santa Rosa mine, W. Floyd to be the Supt. There is a tunnel about 75 feet in on the mine, and this is to be extended 500 feet farther. Inside of 200 feet it is expected to cut the first ledge and a few hundred feet farther in a second vein.

President H. E. Averill, R. D. Jackson and D. R. Finlayson of the Yuba M. Co., owning the Yuba mine at Mayhert, state that work will be resumed on the mine on a much larger scale within a short period.

Operations have been resumed at the California or Gold Tunnel mine, near Nevada City. Supt. E. Lawrence is arranging for installing an entirely new hoisting and pumping plant of capacity to sink the shaft to a depth of 2000 feet. The present plant was merely erected to pump out the mine to a certain depth, retimber the shaft and make tests of the ore. As soon as the heavier machinery is in place pumping and sinking will commence, using electric power for both. The shaft is now down 540 feet.

PLACER COUNTY.

The 20-stamp mill and trolley cars on the ore tramway at the Three Stars mine at Ophir have commenced running.

SAN BENITO COUNTY.

The annual statement of New Idria Q. M. Co. for 1901 shows: Total cash disbursements, $169,855.65; total payroll, $101,480.56; ore mined and treated, 31,866 tons; quicksilver produced, 4800 flasks, 367,200 pounds; average yield, percentage, .00576; cost of ore reduction per ton, 64 cents; cost of mining per ton, including development work, $1.82; tunnels, raises and drifts excavated, 1422 feet; cost per foot development, $4. A new furnace has been erected and put into service during the past year.

SAN LUIS OBISPO COUNTY.

At the Oceanic quicksilver mine, near Cambria, there is a large quantity of high-grade cinnabar on the dumps awaiting reduction. A furnace is under construction and nearly completed.

L. J. Sinnard has sold to Paso Robles people a large group of quicksilver claims at Adelaide. A company has been incorporated to develop the property.

E. Ladner, of Paso Robles, has sold eighty acres of cinnabar-bearing land, 12 miles west of Paso Robles, for $10,000 to J. Stevens, representing Los Angeles people, who project the erection of a $15,000 reduction plant at once. Croppings, assaying 30% quicksilver, have been taken from the ledge, but it has never been developed.

At the Klau mines, near Paso Robles, about 200 flasks of quicksilver are being produced monthly. About seventy-five men are employed. Machinery and a reduction plant, representing the expenditure of over $100,000, have been installed during the past year. About eighty or ninety tons of ore are worked daily.

SHASTA COUNTY.

The Shasta May Blossom M. & S. Co. is developing a mining property at De Lamar. M. Lindley is manager.

SIERRA COUNTY.

At the York mine in Slug canyon, near Downieville, J. W. Finney has seven men at work sinking the shaft and constructing a shaft house.

The Swansee gravel mine at Chipp's Flat, near Alleghany, has been worked intermittently for forty years. A tunnel started nearly that long ago to tap the gravel channel, now in a distance of 2200 feet, is to be advanced to the channel by J. Brock, H. B. Budd and F. Godfrey, who have a bond on the mine. They estimate that another 150 feet will reach the channel.

SISKIYOU COUNTY.

The Snoozer ledge on Russian creek, near Etna, owned by Clark & Wyke, has been bonded by H. Finley of Sawyers Bar and a local company has been organized to take hold of the property and commence opening it up.

The Weideman & Williams ledge, on North Fork of Greenhorn, near Yreka, is to be reopened by E. Northcutt, who has bonded it.

TRINITY COUNTY.

The Oriole quartz mine, discovered last spring, about 2½ miles from Indian creek, is being developed by the owners—Paulsen, Leininger & Morris—by running tunnels, from which ore is coming out. The ledge is about 3 feet in width and carries free gold, running from $10 to $200 a ton. In the spring an arrastra or small prospecting mill will be erected.

At the annual meeting of the Last Chance G. M. Co., held in Philadelphia, Pa., on January 13th, the following were elected directors: J. H. Woodside, G. H. Colket, I. Levin, J. S. Keith, H. Hile, C. C. Shubert, J. W. Teitsworth, C. R. Fulmer and J. C. Hile. The company operates the Paulsen-Hughes mine on the Trinity river, near Weaverville.

TUOLUMNE COUNTY.

E. B. Burdick of Meyer's Falls, Wash., and Mr. Rigg of Spokane, Wash., have

bonded the McAlpine mine, near Big Oak Flat.

The Campo Seco G. M. Co. are calling for bids to sink a double-compartment shaft 115 feet on their property near Jamestown.

The Union Trust Co. of San Francisco has deeded the Pino Blanco quartz mine, at Pino Blanco, to P. P. Chamberlain and J. L. Ross for $1000.

At the Olson mine, near La Grange, the Santa Cruz M. Co. has five men employed. Five carloads of copper ore have been shipped with satisfactory returns. A steam hoist is to be installed.

COLORADO.

BOULDER COUNTY.

The Gold Lodo mine has started up again. From the 100-foot level they have started to upraise to make an air shaft. George E. Blaisdell is manager.

Work has been commenced on the construction of a 100-stamp mill at Hicks gulch, near Wall Street, by the Boulder County M. Co.

CLEAR CREEK COUNTY.

The Red Oak G. M. & M. Co. mill at Georgetown was destroyed by fire on the 25th ult. A B. Montgomery, secretary of the company, states that the company will erect a concentrating mill with a capacity of 100 tons to replace the one destroyed. The work of rebuilding will be started at once. The mill was totally wrecked by the fire, and all the former machinery will be replaced by machinery of the latest type.

GILPIN COUNTY.

New England people are interested, as the Atlantic Mines Co., in doing surface work on four claims, near Central City. F. Totnam is in charge of the work.

The Town Topics G. M. Co. at Central City has paid its fourth dividend of one-half cent a share, amounting to $5000, and $20,000 for the year. An average force of thirty-five men is employed and regular shipments are being made.

Ore carrying copper and a total value of $110 per ton has been found in the 210-foot east level of the Ingalls mine at Central City.

The Mingo M. Co., through its secretary, J. M. Short of Denver, has bought the Williams crossing lode, near Central City, from Mrs. A. Drake & Co. for $1000. A contract has been let for sinking the 210-foot shaft 100 feet deeper. L. Drake is Supt.

G. Zancanella and others of Russell have sold to the Argo M., Dralnage, Trans. & T. Co. (better known as the Newhouse tunnel), a three-fourths interest in the Elizbone and Trentina lodes at Russell for $1600.

During the third week of January the shipments of smelting and crude ores, mill tailings and concentrates from Black Hawk to the smelters and Idaho Springs mills were eighty-three cars, or 1535 tons.

At the Wautauga property of the Calumet G. M. & M. Co., near Central City, development work is being done under J. Clayton, manager, the work being principally confined to the sixth and seventh levels, upraising to make a straight shaft to the surface. The daily shipments average two cars.

The Little Sunshine G. M. Co. has been incorporated by E. Pryce, S. W. Whitelock, L. W. Kimball, T. J. Sipple, O. Wisby, L. E. Lewis, J. B. Matthews, H. P. Kellogg, J. Lawcook and A. S. Culbertson, all of Boulder, with a capital of $500,000, to mine near Central City.

The Opal M. Co. of Cripple Creek has been incorporated to operate the Castle Rock property, situated in Chase gulch, near Central City, and the work will soon be commenced.

GUNNISON COUNTY.

At the Citizen and Maid of Athens mines, near Pitkin, the shipments at present average 550 tons per month. The ore from the Maid of Athens it is claimed averages fifty ounces in silver and $2.50 in gold. The Citizen ore runs eighty ounces in silver and from $4 to $5 in gold per ton. The Maid of Athens is owned by T. Huxtable and W. Friend of Pitkin and H. A. Frambach of Denver. The Citizen company is controlled principally by J. C. Osgood of Pueblo.

The New Sylvanite M. Co. has been incorporated, with office at Monmouth, Ill., to operate the Sylvanite group at Gothic. J. R. Hanna is president and J. F. Searles secretary. The Sylvanite mine has over 5000 feet of workings. The mineral is a high-grade silver product, the shipping ore, it is claimed, netting on an average $500 per ton.

The Congress G. M. & M. Co. of New York has bought the Comstock, Joe and Belvedere lodes, near White Pine, from F. A. Potter for $2000, and intends to do extensive work during this year, for which it is reported to be arranging.

The Tomichi valley lead smelting plant at Cosden, near White Pine, it is reported, will resume operations. The company operating this plant is composed of Boston and Ohio people. They are developing some lode claims at White Pine.

HUERFANO COUNTY.

The Copper Bull M. Co. has been incorporated at St. Louis, Mo., to operate twelve claims, including the old Copper Bull mine on Pass creek, near Walsenburg. Old development work shows five veins of copper ore running from 10% to 15% in copper, with considerable gold. C. O. Unfug of Walsenburg is manager.

LAKE COUNTY.

The Graham Gulch M. Co. has been incorporated, capital $100,000, by J. M. Maxwell, A. Dyatt and G. H. F. Meyer, to operate the Star of the West mine at Leadville. The intention is to put a shaft down at least 500 feet after sulphides. Mr. Maxwell is manager.

OURAY COUNTY.

The Saratoga Pyritic Smelting Co. has been incorporated to erect a smelter in Ironton, near the Saratoga mine, by E. F. Anderson, E. C. Rhodes, F. E. Brophy, E. H. Mather and W. J. Sawyer, the last named of Leadville. The capital stock is $250,000. The Saratoga mine, L. R. Fry manager, contains large bodies of low-grade ores, which could not be worked, owing to the expense of transportation to railroad, and the smelter is projected to handle them.

J. J. Carmichael of the Blaine mine, near Sneffles, says the crosscut tunnel being driven to intersect the Blaine and Homer veins at a depth of about 2200 feet from the surface, after being driven 1400 feet, cut the vein, 26 feet wide where intersected and appearing to be all mill dirt, with some streaks of shipping values. He states that a mill and tram will probably be built this summer.

SAN MIGUEL COUNTY.

The Smuggler-Union M. Co. has rebuilt the upper terminal of the lower tramway, tunnel houses and blacksmith shop at the mouth of the Bullion tunnel, which was destroyed by fire in November of last year. At the mouth of the tunnel an arch is built of stone, on which steel doors are hung, and in the tunnel at a distance of 40 feet another set of doors are provided. Between these two sets of doors is a 24-inch ventilator. The blacksmith and machine shops are separate buildings and constructed of stone. The mine is again running at full capacity; 450 tons of ore are daily sent to the mills at Pandora and 350 men are at work in the mines.

SUMMIT COUNTY.

The Little Mountain mill, at Breckenridge, owned by the Germania M. Co., has been leased by the Puzzle M. & Red. Co., which proposes to put on new concentrating machinery to treat the Puzzle mine ores. J. Callbreath is manager.

The Connors Bonanza M. & Red. Co. of Milwaukee, Wis., operating on Elk mountain, near Kokomo, is driving a tunnel 7x8 feet in the clear, double track, with power house, boarding houses, etc. The tunnel is now in 740 feet and advancing 6 feet per day. The company owns about 160 acres, including the Robinson dike, Smuggler, Tom Moore and other producers. J. T. Keegan is manager and W. P. Noble assistant manager.

TELLER COUNTY.

The following are the figures given out by the mills and smelters for the January production of Cripple Creek district:

	Tons.	Average Value.	Total Value.
Colorado-Phila. at Colorado City...	10,500	$22 00	$231,000
Standard, Colorado City.....	13,500	26.00	351,000
Unlon, Florence...	3,500	25.00	212,500
R. M. Smelter, Florence.....	500	60.00	30,000
Dorcas, Florence..	2,700	27.50	74,250
Economic, Victor.	4,100	50.00	205,000
American S. & R. Co.....	15,500	60.00	930,000
Total	50,300		$2,033,750

The number of applications for leases on Cripple Creek mines in every section of the district is said to be increasing. It is noticeable that the royalty percentage exacted is generally lower than ever before.

It is reported that the Elkton Co., at Cripple Creek, will use a diamond drill for the purpose of exploring the ground lying south of the shaft at the 800-foot level. The flow of water, at one time the heaviest in the camp, has decreased so that one station pump in the 800-foot level handles it without strain.

It is reported that W. S. Stratton of Cripple Creek contemplates the erection of a cyanide plant of great proportions, possibly capable of handling 600 tons of ore a day.

The annual report of the Anaconda M. Co. at Cripple Creek shows that during the year the royalties paid by lessees amounted to $60,399.10.

The Mary McKinney Co., at Cripple Creek, G. Keener manager, has resumed sinking in its three-compartment shaft. The shaft is 4x16 feet in the clear and has a present depth of 500 feet; it is to be put down to 600 feet.

IDAHO.

BLAINE COUNTY.

The Intermountain M. & M. Co., which has a bond on the Wolftone group of mines, near Hailey, has let a contract for 250 feet of tunnel No. 2. The tunnel No. 1 just completed exposes a vein 20 feet thick.

IDAHO COUNTY.

Reports say that there is but 2 feet of snow on the ground at Thunder mountain, and a stage line which is being constructed from Ketcham has been completed to a station within 30 miles of Thunder mountain. The mill on the Dewey group is reported as running steadily, with the first cleanup of gold from the plates sustaining the claims of pay values that have been made.

F. Brown, manager of the Jumbo mining property at Buffalo Hump, says the Jumbo property has now been steadily operated for over two years. A 4-stamp mill and a Wilfley concentrator were put in operation last August. The property has produced since that time $5000 per month in gold, taken from the plates and in concentrates. They are enabled to save about 75% of the gold in the milling process. All of this ore has been taken from a pay shoot from 6 to 12 feet in width without sorting. They expect to put in a new 20-stamp mill in the spring and will also erect a large concentrating plant to treat the tailings.

KOOTENAI COUNTY.

The Richmond G. M. & M. Co. has been incorporated at Tyson to work the Richmond, Washington, Idaho, Morning Star and Gold Bug fractional lode claims at Tyson. The Richmond ledge is in a fissure 14 inches wide, cutting a porphyry dike. A force of six men has been put to work, all agreeing to accept one-half stock in payment of wages. The new company's officers are H. W. Desgranges president and P. Desgranges secretary and treasurer.

OWYHEE COUNTY.

A. F. Stevens has made the surveys of the ground for the site and plans for the mill at Silver City to be built by the Addie M. Co. Construction will be begun as soon as the contracts are made. The mill will be ten stamps and be run by electric power, only five stamps being put in to begin with.

MONTANA.

CASCADE COUNTY.

D. Llewellyn and W. H. Harmon, who are leasing on the O'Brien property at Neihart, are reported to have taken out thirteen tons of what is almost malleable silver. The ore, it is said, runs 18,000 ounces silver to the ton.

FERGUS COUNTY.

The North Moccasin G. M. Co. has been incorporated, capital $2,500,000, by J. D. Waite, F. E. Wright, W. C. Waldorf, W. C. Draper, A. H. S. Bird of Salt Lake City, Utah, A. S. Wright and A. W. Warr, the latter being secretary of the company. The Waldorf, Draper and Riser properties at North Moccasin have been bought by the company. Development work is being done and it is expected to build a mill in the spring.

The automatic tramway between the mine and mill at the New Year G. M. Co.'s property at New Year has been completed. The cost of the erection of this aerial tramway is $17,500 and the total weight of the cables and castings used in its construction is over 86,000 pounds. The tramway was erected under the supervision of C. A. Case and is suspended from eighteen towers, varying in height from 14 to 56 feet. The tramway is run on two cables, known as the track and grip cables, which rest on arms reaching from the tops of the towers, and the ore is carried in forty-five buckets which hold about 600 pounds of ore each. The tramway is self-operating, the loading station at the mine having an elevation of 602 feet above the mill terminal.

FLATHEAD COUNTY.

From West Fisher it is reported that a building boom is setting in in the town of Cabinet. W. J. Beager, manager of the American Kootenai M. Co., is preparing to install an electric compressor plant and air drills, after which the mine will resume operations.

The Northern Montana M. Co. officers at Kalispell are considering the doubling of their force at the mine. The main tunnel is now in 100 feet.

PARK COUNTY.

W. L. Tipton, secretary of the Climax G. M. Co., of Spokane, Wash., has taken a bond and option upon the McCauley mining properties in the Crevasse district, near Livingston. He has started work upon the mines and states that he expects to start the mill up. H. Bush is manager.

GALLATIN COUNTY.

The Montana Corundum Co. has bought machinery for the corundum mines on Camp creek, near Bozeman. It has been determined that the corundum vein grows larger with depth, and the area of the deposit has been found much larger than at first supposed.

LEWIS AND CLARKE COUNTY.

The Exploration & Mining Co., capital $1,000,000, has been incorporated at Helena to develop some of the abandoned mines and good prospects near Helena. The directors are N. B. Holter, N. J. Gould, C. W. Whitley, A. H. Barret, G. E. Gunn, S. T. Hauser, T. C. Kurtz, C. C. Newman, E. C. Babcock, S. Wheaton, H. Sieben and B. H. Tatem. It is reported that the Scratch Gravel district mines will be reopened and that the Kenwood property will be worked.

TETON COUNTY.

The Chief Mountain M. Co. has been incorporated, capital $30,000, with J. H. Van Pelt president and W. J. Barrette secretary and treasurer. The company owns the group Two For, Sunday, Chief and Abbie Belle claims; office at Salt Lake City, Utah.

NEVADA.

ELKO COUNTY.

The Smuggler mines, in Good Hope district, have been sold to C. W. Jordan and D. S. Dunbar, of Omaha, Neb.

NYE COUNTY.

R. W. Calderhead, of Dawson, proposes to put on traction engines for hauling freight between Tonopah and the railroad at Sodaville. Two tractions, each capable of drawing seventy-five tons of ore, he states, will be put on, and he expects they will make an average speed of 3 miles an hour. Three men will be required on each.

It is reported that a rich strike had been made 10 miles north of Tonopah and that a rush to the new find had taken place.

The Ohio Tonopah Co. has been incorporated under Arizona laws, with office in Youngstown, Ohio, to take over and develop the California, Colorado, Arizona and Utah claims at Tonopah, held by B. E. Shear, S. A. Knapp and E. E. Knapp. The present shaft will be enlarged to a double-compartment, which will be sunk through surface porphyry and the ledges opened by crosscuts.

The Tonopah Bonanza M. Co. is a new incorporation of Tonopah mines. H. Gates is president and A. G. Gurnett of San Francisco, Cal., is secretary. A shaft is being sunk on the property.

WASHOE COUNTY.

The Cabin No. 2 mine, at Olinghouse, formerly owned by Francovich, Del Piazzi and Dondero, has been sold for $80,000 to San Francisco people, through M. D. Young and C. J. Dickers. The mine shows high-grade ore from the surface to a depth of 210 feet. It is proposed, if enough other mining ground and ore can be secured, to erect a large stamp mill on the river and work by water power.

NEW MEXICO.

COLFAX COUNTY.

The Denver mine, at Elizabethtown, M. Walsh manager, is installing a large cyanide plant, a new steam hoist for the shaft on the Denver and other machinery. The mill on the property is under construction. The gasoline engine now on the Denver shaft is to be removed to the Arlington tunnel, another property of the Ohio G. M. & M. Co.

GRANT COUNTY.

The Lena M. & M. Co. is building a railroad from its properties in the Virginia district to Lordsburg, at which point it is erecting large concentrating works. The road will be 4 miles long.

At the Arizona mine, at Pinos Altos, the main shaft is down 104 feet below the second level. Smelter returns from the ore give 4.05 ounces gold, 17.7 ounces silver and 3.80% copper—a value of $82.30 to the ton. Twenty men are employed.

LINCOLN COUNTY.

The Free Gold M. Co. has been incorporated, capital $500,000, to engage in mining near Nogal. The company owns the Enterprise, Corker, Cracker Jack, Gold Bar, Ruby, O. K., Nannie Baird, Mollie Gibson and Side Issue claims, and will do development work until ore in sight warrants the building of a reduction plant. The ores are all free-milling.

OREGON.

GRANT COUNTY.

The Prairie Diggings mine, near Prairie City, owned by the Hoosier Boy M. Co.,

E. J. Foster, manager, is reported to have opened up a large vein of ore by tunnels and an open cut. The getting out of this ore is a quarry proposition on a large scale. A 20-stamp mill has just been completed and the mine put in operation. The new stamps weigh 1000 pounds each, and the mill is run by water power. The company owns a water power for a 100-stamp mill, and it proposes to increase the number of stamps until the water power is utilized.

JOSEPHINE COUNTY.

A meeting of mining men, among whom was C. R. Johnson of Montana, has been held at Merlin, 8 miles north of Grant's Pass, to consider the erection of a smelter at Merlin, which is centrally located in the northern Josephine mineral region. Another meeting to further consider this question will be held and a permanent organization is talked of.

UTAH.

BEAVER COUNTY.

The Monte Cristo G. & C. M. Co. has been incorporated at Salt Lake City, capital $125,000. J. L. Craig is president and J. H. Featherstone secretary and treasurer. The company owns a lease and bond on the John Kemple and Good Luck claims in the Star district.

JUAB COUNTY.

About one-third of the earned dividends of Tintic mines are not made public because of private ownership. Following is the published list for 1901:

Cen. Eureka	$200,000
Carisa	30,000
Mammoth	100,000
May Day	18,000
South Swansea	7,500
Swansea	29,000
Uncle Sam Consolidated	45,000

PIUTE COUNTY.

The Golden Ridge M. Co. of Marysvale has been incorporated, capital $20,000, with M. R. Dalton president and M. F. Murray secretary. The company owns the Hattie, Promise, Jewel, Elgin, Midland, Rock Springs, Marysvale, Neuta, Fawn and Hill Contact claims in Mount Baldy district.

It is reported that Manager Rader of the Annie Laurie mine at Gold mountain has recommended to the company that it add immediately to the milling plant, proposing that the capacity of the present plant be doubled to provide facilities for treating 400 tons daily.

SALT LAKE COUNTY.

The Brekly G. & S. M. Co. has been incorporated at Salt Lake City, capital $5000. G. Romney is president and C. B. Stewart secretary and treasurer. The company owns the Mineral King, Mineral King Nos. 1, 2, 3 and 4, Red Pine and Red Pine Nos. 1, 2, 3, 4 and 5, Copper King, Copper King Nos. 1 and 2, in Little Cottonwood district.

FOREIGN.

BRITISH COLUMBIA.

Finch & Camphell of Spokane, Wash., have received the first consignment of gold from the Second Relief mine, near Ymir, on which they have installed a 10-stamp mill, which in its first month's run has returned $2000 gold. The present stamp mill is a link in a system of more extensive surface improvements which will probably be employed. It is stated as probable that a cyanide plant will be installed to treat the tailings.

The annual report of the Le Roi No. 2 mine states that the company has 240,000 tons of ore in sight and a plant capable of getting out 250 tons of ore daily. During 1901 the gross expendlture in mining operations was $277,624; shipments to the smelter for the year, 24,689 tons, containing gold $226,624, or $9.18 per ton; silver, $22,739, or 92 cents per ton; copper, $186,641; total gross value, $435,005; average per ton, $17.65. The costs of mining and loading on cars were $3.58; freight and treatment, $6; reductions from gross metal values, $1.98; total cost of realization, $11.56, leaving net value per ton profit of $6.09. The purely mining costs per ton were: Stoping and loading on cars, $2.90; development, 12½ cents; machinery and plant, 15 cents; surface, 30 cents; mine equipment, 10 cents; total, $3.58. Bernard Macdonald is manager.

The lead and copper furnaces at the Canadian Smelting Works at Trail have heen hlown out and are to remain so until alterations under way are completed. The old sampler, with a maximum capacity of 1000 tons in twenty-four hours, is being replaced by a modern automatic crusher and sampler of 1500 tons capacity in ten hours. A site for the new refinery is heing prepared. The Center Star and War Eagle mines at Rossland will commence shipping on a large scale as soon as the machinery is in operation.

The contract for sinking in the main shaft of the Le Roi mine and for drifting on the 1050-foot level has been let to Vance, Skugland & Co. at their bid of $10,000. The work, it is estimated, will require three months to complete.

BRITISH GUIANA.

J. P. Skelly of the New York Syndicate, operating there, has brought out to Demerara from the upper Mazaruni 112 diamonds, three emeralds and three blue sapphires, found while prospecting with three men. Mr. Skelly reports that the claims he located—1350 acres—show good indications of being rich. In prospecting, as many as twenty-eight diamonds were found in one prospect hole near a small creek. He also reports that there is a hill of fair size showing indications all over.

The British Guiana Syndicate are going ahead with construction work and will soon be started. The Marshall Syndicate are doing a good deal of prospecting and are making a hridge to convey their stuff to the creek. The Menzies Stripp and Morris Syndicate are taking out up to 300 diamonds a day on one of their claims.

CHILE.

It is stated that 588 cars of sulphide ores have been shipped from Chile, South America, to the smelters at Puehlo, Colo. The transfer from ocean vessels to the railroad was made at Galveston, Texas.

INDO-CHINA.

M. Marc Bel, a mining engineer of Paris, France, who has recently traveled over a large part of Indo-China for certaln mining companies, says of the mineral wealth of the country, that the geological formations, by their nature and disposition, are such as should contain minerals in abundance, while the economical conditions are very favorable to the development of the mining industry. Apart altogether from inferences from the nature of the rocks, it is known that sapphires, gold, tin, copper, zinc, antimony, lead, iron, coal, marble and china clay exist, and many deposits of these are worked to some extent. Burmese prospectors found sapphires on the left bank of the Meekong in 1890, and for a time worked the heds with success; auriferous deposits, especially placers, are numerous, and they have been worked hy the natives from time immemorial. Several mining companies are at work at these deposits, hut the production is still very small. Tin is worked to a very small extent, and lead, copper and antimony not at all.

KLONDIKE.

A. Bronson and J. F. Miller have arrived at Haines Mission, Alaska, with $10,000, they claim as two weeks work on Mush creek. They would not give the exact location of their find.

The Munger quartz mill, situated on the banks of the Klondike river, is a stamp, steam-hammer mill. The machinery is inclosed and no difficulty has heen encountered from the low temperature of winter. The pulp, after running over the plates and concentrators, is discharged into a 6-inch pipe which empties into the Klondike below the level of the ice, and through a covered way whlch it is believed will prevent all stoppages from freezing.

The first quartz mining company to get its charter from the Yukon council is known as the White Channel M. Co., and its capltal stock is $100,000. The directors are J. O. Binet, N. Palardy, T. Delarge and H. Landahl. The company is organized to develop the following quartz properties, running up Bonanza and into the divide between Eldorado and Bonanza: The Pauline, the Matilda, the Marie Jane, Bald Eagle, the Windsor, the Tiger, the White Bear, the Detroit, the Laura, the Leon, the Black Bear, the Victor, the Henri, the Corinne.

MEXICO.

(Special Correspondence).—The Castellana mines at Ixtlan, belonging to the company of same name, A. Lonergan president, have been sold to the Castellana Con. Mines, Ltd., of London, Eng. R. J. Price of London is president, R. Donde and J. L. Requena are Mexican directors and the general manager is J. F. Allan, M. E. The mines Castellana and Anexas have heen large producers, the higher grade ore being shipped to Aguascalientes smelters and the milling ore heing treated at the reduction works of Lonergan & Stanhope, who have also sold to the new company. The present machinery—three Chilian mills of thirty tons capacity per day—will be added to by the new company, who propose to erect a large plant on the property. The town of Ixtlan is 30 miles from the San Marcos station of the Mexican Central Railway.

The mines at Acuitapilco are in a limestone uplift and opened from the ravines which are eroded in it. They are contained within an area of 4 square miles. The mines are divided into three groups—the Valenciana, Trinidad & Buenavista and El Mezquite. The Valenciana group comprises the Valenciana and Santa Rosalia, producing silver and gold. The output during the last two years was $40,000, from exploratory work done on a very small scale. The Trinidad group includes the Trinidad, Buenavista and San Jose mines. The Mezquite group is composed of the Mezquite, Catarina and Todos Santos.

El Zopilote M. Co., near Tepic, during 1900 made an output of $201,304.68 from 4943 metric tons of ore and from it paid dividends amounting to $63,600. The property of the company consists of the mines known as Zopilote, Frazada-Jabalina and Restauradora. The machinery consists of a 30-stamp mill, one German mill and lixiviation plant. Sulphide ores are shipped to Hamhurg, Germany.

F. Cornado is developing the group of Animas-Plomosas mines at Acaponeta, Tepic, and is making permanent improvements.

The Huicicila mining property at Compostela, Tepic, known as San Francisco-La Trlnidad, is being worked on a small scale by A. R. Partridge, who has installed a small matte smelter.

Tepic, Jan. 25.

Personal.

A J. FROEHLICH of Tonopah, Nev., is ln Chicago, Ill.

W. C. RALSTON of Robinson's, Cal., is in San Francisco.

P. MIXSELL of Denver, Colo., is sojourning in New York.

J. H. HENLEY, Supt. of the Ibex M. Co., at Leadville, Colo., has resigned.

JOHN S. BRANSFORD has been elected president Mining Exchange, Salt Lake Clty, Utah.

C. K. MCCORNICK, of Salt Lake City, Utah, has gone to Paris, France, on a short visit.

WILLIAM FLOYD will superlntend development work on Canada Hill, Nevada county, Cal.

A. M. JOHNSON has been appointed manager of the Ophir mine and mill at Stateline, Utah.

W. M. WILEY succeeds Carl Henrich as general manager Unlon Copper mine, Gold Hill, N. C.

J. E. WARDMAN is now superlntending the operations of the Traders G. M. Co. at Dewey, Idaho.

T. M. HAMMOND, civil and mining engineer, late of Republic, Wash., has located at Reno, Nev.

J. B. KEATING has been appolnted Supt. of the Bully Hill smelter at Delamar, Shasta Co, Cal.

PHILIP ARGALL has returned to Denver, Colo., from examination of the Dolores mine, Chihuahua, Mexico.

W. R. RUSSELL is now general foreman at the McClure mines at Bully Hill, Shasta county, Cal., and E. J. McLaggen shift hoss.

J. R. FLAGG has accepted the superintendency of the Maple Creek mines in Junction City, Cal., succeeding C. Scranton, resigned.

J. C. CAMPBELL has returned from San Francisco to Banner Ridge, Nevada county, Cal., where he undertakes extensive development work.

M. WALSH, manager of the Ohio G. M. & M. Co., at Elizabethtown, New Mexico, has returned to that place from an extended sojourn in Denver, Colo.

R. N. DICKMAN, of Dickman, Mackenzie & Potter of Chicago, has gone to Europe, where he will examine mines in the interest of American capital.

H. A. COHEN, manager of the Mercur mine, at Mercur, Utah, has resigned, and it is reported ls to be succeeded by John Dern, the present assistant manager.

J. C. FARRISH AND W. A. FARRISH, of Denver, Colo., have been making an extended examination of mining property in the Altar district of Sonora, Mexico.

W. DENBY has resigned the superintendency of the Ehner mines at Juneau, Alaska, and has accepted the same position with the Snettisham G. M. Co., at Snettisham, Alaska.

GRANT SNYDER, superintendent of the Dixie mines and smelter at St. George, Utah, is at New Haven, Conn., attending the annual meeting of the Utah & Eastern Co., owning the mines.

E. R. ABADIE has accepted the superintendency of the Champion mine, at Nevada City, Cal., and is expected at the mine about the middle of February, when he will immediately enter upon his duties.

C. W. BUTLER, formerly head of sampling department Puget Sound Reduction Co., Everett, Wash., is with the Pacific Coast Ore Sampllng Works, whose new building has heen completed at Adams' wharf, Oakland, Cal.

WILLIAM C. POTTER, chief mining engineer of the Atchison, Topeka & Santa Fe railway, has formed partnership with Dickman & Mackenzie of Chicago, the firm hereafter heing Dickman, Mackenzie & Potter, mining engineers.

JESSE J. MACDONALD, formerly with the Gold & Silver Extraction Co. of America, Ltd., has accepted a position with the Inca Mining Co, at Santa Domingo, near Tiraphola, Peru, S. A., and leaves San Francisco, Cal., on the 10th inst., to remain two years.

F. W. BLACKFORD of Butte, Mont., is chief engineer of the new mining project for operating the Cerro del Pasco mines ln Peru. He will be associated with J. MacFarlane, the company's resident manager, and John Chisholm of Denver, Colo., who, with Mr. Blackford, has started from New York to Callao, Peru.

WYNN MEREDITH AND C. L. COREY, of the engineering firm of Benjamin, Hunt, Meredith & Corey, have returned to San Francisco, Cal., from an extended reconnoissance in the vicinity of Prescott, Arizona, where is projected an electrical plant on Fossil creek to furnish light and power throughout that mining section.

W. L. AUSTIN, of Denver, Colo., left there this week on an extended itlnerary, and, llke all other mining engineers, wants the MINING AND SCIENTIFIC PRESS every week as usual. It may be interesting to note that this issue aud the issue of the 15th inst. goes to him at the Grand Continental, Cairo, Egypt, the issues of the 22nd inst. to Jerusalem, Palestine, those of the 1st, 8th and 15th prox. to Constantinople, Turkey, and so on, round the world.

Commercial Paragraphs.

MONTEVIDEO, URUGUAY, S. A., is to hold an exposition of goods manufactured exclusively in the United States. It will be called "The First North American Exhibition on the River Plate."

THE Risdon Iron Works of San Francisco, Cal., are sending two hydraulic elevators with capacity each of 75 cubic yards per hour, and two 6-inch giants, to the Siberian Exploration Co. by a circuitous route. They go to New York, thence to Copenhagen, to Libau, to Tomsk, Siberia, and the Achinsk district, 300 miles southeast of the last named place.

THE Pyne Smelting Works at West Alameda, Cal., has put in two new furnaces, dally capacity of each forty tons. Smoke and vapor are conducted through a condensing chamher and subjected to a water spray to deposit and save such values as may escape through the flues. Water and rail shipping facilities are at hand. Appliances for handling are expeditiously and economically being used. E. W. Pyne, whose smelting experience covers many years in different parts of the world, has direct charge of the works. The company says it is prepared to handle gold, silver, lead and copper ores of all grades.

WM. JESSOP & SONS, LTD., of Sheffield, England, have introduced an entirely new type of quick speed, self-hardening steel, for which are claimed: Uniformity and easy manipulation, with the best working results in shop practice. Instructions for working are simple and no elaborate process of hardening is required. The tool to be forged is heated uniformly to a bright red, forged to shape and allowed to cool. They say: "To harden, place the nose of the tool in the fire, and heat to a good white heat. Allow to cool away from the hearth, and thoroughly remove, by grinding, the thick scale which results from this high temperature. After the tool has heen ground four or five times, to get the best possible results it is found advisahle to reharden, without, however, dressing the tool in any way." Jessop's American headquarters are at 91 John street, New York.

Obituary.

CAPTAIN THOMAS COUCH died in San Francisco, Cal., on Feb. 6th, at the age of 58 years. The deceased was one of the best known mining men on the Pacific coast, having at various times heen connected with the operation of the mines on the Mariposa Grant in California and the great copper mines at Butte, Mont. Lately he had been largely interested ln the successful gold dredging enterprise at Oroville, Cal.

MINING AND SCIENTIFIC PRESS.

Whole No. 2169.—VOLUME LXXXIV. Number 6. SAN FRANCISCO, SATURDAY, FEBRUARY 15, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Technical Books and Technical Journals.

The busy mine manager, mining engineers in active practice, and specialists in all of the many technical branches of mining and metallurgical industry, depend to a steadily lessening extent on technical books, and to a steadily increasing extent on current technical journals, to keep them informed of what is new and improved in the art. Mining is a many-sided art. It is at this time receiving the application of a concentration of brain energy, that is extending its limits into what on the one hand has been considered as abstract science, and what on the other hand has been considered just practical, every-day commercial business. Books, the publication of which a few years since was rapid enough to keep those engaged in the art in knowledge of what was going on in its advance, are now too slow of publication to give this service. Also, what the man wants who is making a commercial use of science is the minutest detail of its every-day, practical application by others similarly engaged. The mass of this would stagger a book writer—that is, one who tried to tell it all in books—and, it might be added, would be even more overwhelming to a book reader.

Old Dominion Mine and Smelter, Globe, Arizona—(See page 88.)

The little things in an art can not be boiled down to a paragraph or condensed within one small book; but they can be given in assimilable installments. It is the only way they can be successfully taken. Hence it is the workers depend less and less on the technical books and more and more on the technical journals. Even the mass of the latter is with difficulty fully assimilable by the busy worker. A consulting engineer of the writer's acquaintance said recently to him, pointing to a mass of weekly and monthly technical journals piled on his desk: "I do not get time to read them all through. I go through them rapidly, picking an idea here and there, not trying to remember it all, but just that I have read it and where, so that when the time of use of the idea comes I know where to look for it. Even the burden of this is, I find, too heavy for the mind unassisted, and I am scrapping the papers. You don't see the MINING AND SCIENTIFIC PRESS in the pile, because it is all cut up into scraps. These scraps are pasted in scrapbooks and card indexed for me. One set of scrapbooks has only matters relative to the cyanide process. Another is confined to stamp mills and free-milling practice. A third has placer mining and gold dredging for its subject. Others deal with hydraulic work, electrical power development, copper mining and smelting. It is not alone the long papers on these subjects that are clipped and scrapped, but the short ones as well. The latter all have point to them and bring out valuable detail that in longer articles is passed over. I do not think I could keep in touch with what other men are doing and gaining but by this selective method of using what is new and current while it is new and current. Books are all right for general principles and as the foundation for a student; but for the busy man, unless the books are the latest manufactures' trade catalogues, they are only history. What they tell he should know earlier and better from current technical journals and the latest trade catalogues and price lists. It is even a question if the student could not with much advantage leaven his book knowledge by using with it the masters' tools he must in the end do his work with."

It was rather a long talk for a consulting engineer, but it expresses the up-to-date practical action of the men who are making the history of the modern art of engineering. It is this instinctive tendency among the doers that brings requests to the publishers of this journal to have it forwarded to them direct by the shortest time route wherever they may be temporarily placed by their occupation. The intention to keep up with the procession of their fellows by knowing quickly what they are from week to week doing is giving to the technical journal a wider and more permanent field of usefulness than that given to the books of the art.

The book still has a place, it is true, but it is a different place and a relatively less important place. It is realized now that what may be termed the adaptive knowledge of an art is ever changing. Nowhere is this more obvious than in mining. In the current writing-up of newly constructed mining plants they are always referred to as "modern" to emphasize the contrast with plants constructed five years ago—or it may be only last year—which by suggestion are thus made "ancient." The books get the descriptions and methods of the five-year-old plants all right, but must miss the newer ones. It is a fortunate book that, five years old, does not record some details of operative practice in metallurgy that have been replaced later by improvements. Books, though, will always serve the student in the art. They short-cut through the vast mass of a more or less perfect record of practice in which the immature mind of a student can not be surely selective. Besides, the student wants a firm foundation of the basic principles of the art in order not to lose the sense of proportion between cause and effect. This sense of proportion and the logic of cause and effect once secured, the trained mind of the engineer can and does leave its anchor in the books to use the wings that the current records of the technical journals offer it.

Gleeson Camp, Cochise Co., Arizona—(See page 88.)

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....$3 00
All Other Countries in the Postal Union..... 4 50

Entered at the San Francisco Postoffice as second-class mail matter.

J. F. HALLORAN..... Publisher.

☞ MR. GEO. S. SCOTT is now our Chicago representative, office 737 Monadnock Bldg., Chicago, Ill., and is authorized to transact business on behalf of the MINING AND SCIENTIFIC PRESS.

San Francisco, February 15, 1902.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Old Dominion Mine and Smelter, Globe, Ariz.; Gleeson Camp, Cochise Co., Ariz., 84. Sidehill Construction of an Idaho Canal; The Headgates of an Idaho Canal; Dam and Reservoir on Parley's Creek, Utah, 90. Renold High-Speed Silent Driving Chains, 91. Mining and Metallurgical Patents, 92.

EDITORIAL.—Technical Books and Technical Journals, 84. The Rain and Snow Fall of the Last Two Weeks; The Present Rules of Assessment for Taxation; Colorado and Wyoming Petroleum Deposits; Mine Taxation; Railroad Construction in Alaska; Some Lead Mining Conditions; To Connect Separated Portions of Mining Plant, 85.

MINING SUMMARY.—93-94-95

LATEST MARKET REPORTS.—96

MISCELLANEOUS.—Concentrates, 86. The Detection and Estimation of Small Quantities of Gold and Silver, 87. Gleeson Camp, Cochise County, Arizona; Operations at Globe, Arizona, 88. Plans and Measurements of Capability; Metals That Radiate Energy; Notes on Testing Cyanide Solutions by Silver Nitrate; Cost of Compressed Air Hauling in a Mine; Real Genius, 89. Water Supply Works for Mines in the West; The Discovery of Havilah, Kern Co., Cal.; The Treatment of Clay Slimes by the Cyanide Process and Agitation, 90. Tests of Cast Iron Pipes; Renold High-Speed Silent Driving Chains, 91. Mining and Metallurgical Patents, 92. Personal; New Patents; Notices of Recent Patents; Commercial Paragraphs; Recently Declared Mining Dividends, 95-96.

Some Lead Mining Conditions.

There are some signs that the lead miners of the United States have seen the worst of the low sale price condition. The settling price has been advanced 10 cents a hundred pounds by the American Smelting & Refining Co., which would indicate that there has been a shrinkage of current production below current consumption sufficient to begin the gradual clearing away of the surplus lead in stock. The effect of the slight advance in stimulating production can not be known yet, but if it should bring any large increase the price will undoubtedly drop back to the amount of advance at least.

British Columbia lead miners continue to find the business unprofitable. They are making close investigations of the several items of cost charges and acquiring in adversity a knowledge of the real conditions under which they have been operating. It would seem—confirming what this journal has stated—to be the mine owner who has, from one or more natural favoring conditions, the more desirable mine who has the greater cause for complaint, rather than the mine owner who has the less desirable mine.

Specifically, it is claimed that mines favorably situated for transportation are charged a smelting and transportation rate in excess of that charged ore from mines less favorably situated, so that the profit margin of the advantage is appropriated by the smelting and transportation interests. This is certainly an unfair discrimination which, so far as the transportation interest takes part in it, is simply "highway robbery" under the cloak of business. The fact that the transportation interests assume they can not exist except by this method of business does not make its real character any different. The claim may be true that it is done to make the good mines divide and partly carry the cost burden of the poor mines, but in the end it does not do it. The added production of the assisted mines becomes the surplus production which breaks down the sale prices and wipes out a profit which the good mines would have had and which their owners are justly entitled to. Naturally, owners of mines who find, after they are in them with their capital investment, that their mines are at natural disadvantages which make them, relatively speaking, poor mines, do not object to an equalization which makes, or claims to make, owners of, relatively speaking, good mines, share their disadvantages. They get something that they otherwise would not have at all.

The owners of the relatively good mines are the people who are hurt by this condition. Why such conditions should be permitted to exist indefinitely with British Columbia lead mining is not clear. The Government subsidizes and has a control over transportation, and it proposes to subsidize a refinery for lead. There is with these two elements the power to make such discriminating charges for the refining of lead that the natural conditions between mines as to profit-earning power shall be restored.

Mine Taxation.

The taxation of mines is at this time of year a matter of interest to the owners. The assessor either is already, or will soon be, in evidence establishing valuations that may prove to be the basis of reasonable equitable taxation, or that may prove to be a basis for the imposition of fines on thrift and industry. In the purely mining counties of most of the States the assessor's work does not often result in establishing either unreasonable or inequitable valuations. In counties where mining is subordinate the reverse is quite frequently the case. It is but fair to state that the laws defining what is property to be taxed are at the bottom of the difficulty with the question in some States. Under the definitions, what is commercially and technically considered by miners as "dead work," is considered by the assessors and outside public as being real property. Dead work in a mine is construction that in no case is directly productive. It is construction the investment in which is a "waste" technically considered. This "dead work" investment is never recoverable from the "dead work." Dead work is not a chattel or a thing that can be sold by itself. Yet by some queer perversion of intelligence lawmakers and assessors make this "wasted" investment the basis of mine valuations. The mine which has the more "dead work" about it, if going, is given a higher assessment valuation than the one with the lesser investment in "dead work." The method of establishing an assessment valuation for a mine precisely as its commercial value is established seems to be entirely overlooked.

The mine owner when he sells a mine finds that the buyer determines what its market value is by first measuring and estimating the ore bodies in sight and then deducting the cost of recovery of their values plus a reasonable mining proposition profit. The valuation so made is the market valuation. The assessment valuation should be measured from it exactly as the value of other taxable property is measured. It is obvious that only real existing property in mines would be assessed and taxed, were the commercial rule of valuation applied to determine the assessment valuation. Locations and prospects would not be taxed. Tunnels would not be taxed. Mines that are earning nothing would not be taxed. A miner's hopes and his luck chances would not be assessed and taxed. What would be taxed would be the ultimate net profit values of the ore in sight. This would be reasonable and relieve the whole subject of mine taxation of the befogging theories and pocket irritation which it now causes. On the whole, it is a question if the adaptation of this rational rule of assessment would require legislative action to establish it. It is so thoroughly defensible in a court of equity that it might stand the analysis of a law court. Of course, it will be said at once that a mine assessor would have to be a mine expert. It is true, but why should he not be? The end sought being proper and desirable to secure, it would certainly justify a community in making a mine expert its assessor, even though the thought of it is novel.

The present various rules of assessment for taxation cannot be considered wholly satisfactory to any one affected, excepting only the Montana rule, which imposes a fixed rate of tax on net earnings. Practically it amounts to very nearly the same taxation charge as would result from the operation of the rule suggested above. It is a little better for the miner in that he pays nothing till he gets it out of the mine and turns it into money. It has also the advantage of eliminating the uncertainties incident to the estimation by mining engineers of ore in sight. On the other hand, the percentage taken in Montana is higher than the average rate of taxation of other property, and it is paid on full cash value, not on 40% or so of it.

RAILROAD CONSTRUCTION IN ALASKA, considering the undeveloped and practically unknown character of the country and its possibilities in dormant resources, is receiving an amount of serious consideration that could hardly have been foreseen even three years ago. There is no reason to believe that it is not justified by the conditions there and here. The country has no population to speak of at present, but the climatic severity of the high northern latitudes is no longer a bar to economical industrial work. People live and work there much as they do anywhere else. The sure known resources can be utilized so cheaply that there is a large margin to cover the large cost of building and operation of railroads to make them available on even, or better than even, terms with the same production elsewhere. Leaving possible agricultural resources out of consideration, timber, coal, iron, copper and gold by themselves justify large aggregate investments in many comparatively short lines of railroad which will open them up to a connection with harbors on the open sea. Waters powers are abundant and can be cheaply utilized. The minerals (for which in other and longer exploited districts deep mining is necessary) in Alaska are at the surface, where for a considerable aggregate of production only cheap quarry methods are necessary. The future has not been discounted out of Alaska resources, and for themselves they justify railroad constructions which under other conditions would not be under consideration till they could follow established industries and population.

COLORADO AND WYOMING PETROLEUM DEPOSITS are beginning to yield results that indicate that very large commercial values can soon be exploited from them. The development has the desirable feature of not affecting adversely the commercial value of already exploited petroleum fields in other localities. Petroleum is so bulky a commodity, when its commercial value and the cost of its land transportation are considered, that the new production of these Rocky mountain fields does not, to establish itself as a local business, have to displace an established business in other petroleum fields. The discoveries have been made at the right time to provide a cheap fuel to meet a demand for cheap power that has absorbed close on to the limit of possible water power development, and for which coal is too costly. With the exploitation of every new-found mineral deposit, and particularly petroleum, some failures of exploration works are inevitable, but what may be distinguished from such failures as mistakes or errors should be largely possible of avoidance. Experience with California and Texas petroleum development is quite recent enough to be a guide as to what to avoid. Colorado and Wyoming petroleum should be successfully developed without the enormous waste of money that has characterized the petroleum development of the other States.

THE installation of telephones and lines to connect separated portions of mining plants, and to connect them with towns which are the base of operation and supply, is not attended with any great cost. The service rendered by the telephone connections would justify a very considerable cost of installation. No mistake is made in installing a telephone plant right at the beginning of a prospecting or development operation on a mine. As illustrative of the low cost of the plant in one instance reported, two telephones, dry batteries, 2 miles of wire, insulators and a few tools cost $45; and the installation, using trees for poles, cost $15, making the total cost $60. Two of the miners put the line up, including the clearing out of tree branches, in two and one-half days. In another instance, three instruments and 5 miles of line were put up on poles at a cost of $140. The poles used were 4-inch scantlings 16 feet long.

THE rain and snow fall of the last two weeks has cleared away any uncertainty as to the supply of water for this year's dry-season mining in California. While at the beginning of it the depth of snow on the summits was only 2 or 3 feet, it is now several times that and about the quantity at this writing of the average California winter. Generally, reservoirs are insured of being filled, and the high-water stage of the mountain streams will probably extend well into the summer. Mining operations this summer will certainly have the use of an average season's water supply.

Concentrates.

THERE is no duty on zinc dust.

ASPHALTUM is the final residue of rofined California petroleum, representing from 20% to 40% of the oil.

FROZEN DYNAMITE has been knowr to explode. No needless chances should be takon in the handling of it.

THREE GALLONS OF WATER per minute will run through 1200 feet of ¾-inch horizontal pipe under 50 feet hoad.

PLATINUM is used instead of iron or steel for the connection on a circuit breaker of an induction coil, because it neither melts nòr oxidizes.

IN furnishing olectrical power for a gold dredger, 75 H. P. may safely be reckoned for a 5-foot dredger, and 47 H. P. for a 3-foot dredgor.

DISSOLVE 3 pounds salt and 1½ pound sal ammoniac in a gallon of water, and the mixture will be as good as that in hand grenades for fire extinguishing purposes.

AT $43 per share, the value of the Anaconda property would be $51,600,000. It has gone as high as $130 per sharo and was recently quoted at about half that figure.

ABOUT 2000 gallons per ton of ore milled, or 6¾ gallons per stamp per minute, would be a reasonable estimate of the water required for a stamp mill, including all operations.

THE right of an alien to inherit a mining claim located on Government land, as against every person but the United States, is determined by the laws of the State in which the claim is located.

THE Roentgen rays furnish an easy and infallible test for the genuineness of a diamond. The diamond being composed of pure carbon, alone among gems, is perfectly transparent to the x-ray.

H. W. MEADER, now a miner at Chewelah, Wash., is believed to be "the first California copper miner," having erected a blast furnace for the smelting of copper ore in Calaveras Co., Cal., in 1865.

PLENTY CELESTITE—strontium sulphate—is procurable in California, but it is in extensive commercial use only in England and Germany, and the freight would make the price realized from it unprofitable.

A LONG-TIME EXPOSURE will, with natural sunlight that is deficient in quantity for ordinary photographing, give a better photograph than can be obtained by short cutting the time by using a flashlight exposure.

HYDRAULIC PIPE of large size has been made in a field shòp in lengths of 72 feet where the line in which it was subsequently to be laid was accessible for hauling to it, using skids. No deforming or injury to the pipes resulted.

IF there is any considerable quantity of aluminum minerals present in lead ores the custom smelters may add the percentage to the silica percentage and penalize it the same as if it was silica. It is considered a more troublesome ingredient than silica.

THE blower used in bessemerizing copper matte requires a pressure in the upright converter of from 12 to 15 pounds: in the trough or barrel converter from 3 to 10 pounds. In the use of a direct-pressure blower, the two vanes of the blower revolve in a shell.

UNDER favorable circumstances placer ground might be worked with a gold dredger at an average cost of 3½ cents to the cubic yard, which works out about a grain of gold to the ton; but, ordinarily, it will cost nearer 5 cents a yard to operate a gold dredger.

ALUMINUM in nature occurs in compounds nearly all of which have much higher melting points than the metal itself or than other metals. The temperature of fusion is reduced by fluxes which combine with the aluminum minerals at temperatures below the fusion of the latter.

A LEDGE discovered in a county road can be located unless the county has a fee title by mesne conveyances from a patent. If the county has title by patent other than for a quartz mine the county title extends on the dip of the ledge only to the vertical plane of the boundary of the road tract.

THERE is no restriction in the United States mining laws on the number of claims one man can locate in a district or State. Miners by local laws can make limits on the number of claims one man can locate in a mining district. It does not matter whether the locations are of lodes or placers.

TAPPING and draining old mine workings into a tunnel is possible without much exposure to danger if the old works have been surveyed and a record kept. It is then practicable to survey a connection and make it with a drill hole, draining it in advance of completing the connection hy a drift.

THE softest copper is deemed best for amalgamated plates. Copper which carries the least oxygen is the softest. If a plain plate of copper is highly oxidized, there are innumerable points of suh-oxide of copper exposed on the surface of the plate, and mercury will not amalgamate with this oxide.

COPPER exceeding in amount the equivalent of 0 0128 gm. of the oxide to 50 c. c. of solution as the sulphate may be separated completely, even in the presence of a moderate amount of strong nitric, hy the addition of sufficient amount of oxalic acid. Copper may be separated from cadmium, arsenic, iron, and small amounts of tin, when precipitated by oxalic acid in a volume of 50 c. c., containing 5 c. c. strong nitric acid.

THE only weight measure common to the troy and avoirdupois weights is the grain. The avoirdupois pound contains 7000 grains and a ton of 2000 pounds 14,000,000 grains. The troy ounce is 480 grains, so there are 29,666⅔ troy ounces in one avoirdupois ton, and one troy ounce is .00318146 of 1% of a ton.

ONE HUNDRED years ago England produced the most copper of any country—about 7000 tons—in 1901 about 300 tons. Copper extraction began in the United States in 1845. Modern copper smelting came up during the past decade. The Rio Tinto and Tharsis mines afford the best example of wet extraction of copper.

ALL postmasters are authorized to receive and receipt for subscriptions to this journal, but no traveling agent or any one claiming to be a representative of this journal anywhere is authorized to receive money therefor without a written authorization in present force and the issuance in duplicate of a stamped and numbered receipt.

BIOXIDE OF SODIUM, when moistened, decomposes and gives off oxygen. The sodium, moreover, that remains after the liberation of the oxygen absorbs carbonic acid gas, so that if moistened bioxide of sodium be placed in a confined space in which an animal is breathing, it not only replenishes the supply of oxygen, but also keeps the atmosphere free from the deleterious gas emitted in the process of breathing.

DRILL POINTS can be tempered and rendered very hard by the use of the following composition: Six ounces carbonate of ammonia, six ounces nitrate of potash, four ounces soap and fifteen gallons of soft water. These ingredients should be thoroughly mixed by agitation. The tool points, while still red hot, must be submerged in the liquid only so far as the tempering is wanted, and supported in this position until cooled and hardened sufficiently.

ALUMINUM minerals in the ganguo of a lead ore raise the temperature of fusion of the slag above that of the lead and tend to make the slag less fluid. With aluminum minerals present the furnace mixture requires a larger proportion of fluxes. The ore containing it is thus less valuable to smelters in proportion to the quantity. Ordinarily the quantity is small and can be lessened by washing, so that no deduction is made by smelters for it.

OXIDIZING lead, tin or zinc produces more weight in oxide than the original metals weighed at the start, if nothing but heat is used for the purpose of making the oxides. Whatever weight of oxygen is used to convert the metal into an oxide is added to the weight of the metal when the whole is converted. Lead oxide is PbO. The combining weight of lead is 207, of oxygen 16; so 207 ounces lead will use 16 ounces oxygen, and the lead oxide will weigh 223 ounces. The combining weight of tin is 118, zinc 65.

SO FAR as "Concentrates" is advised, there is no plant in Canada where tin scrap is treated for the recovery of the tin. There is a small plant in San Francisco, Cal. The margin for pay is not large enough to admit of using any raw material but the clean, bright scrap. At most places where the scrap is made in making tin cans it could be had for the asking or at a merely nominal price. There are several processes that are practicable. The electrolytic methods seem promising of cheap commercial results.

GENERALLY SPEAKING, tailings that go $1.50 per ton are susceptible of profitable treatment by cyaniding, but careful and repeated experiments should be made on a small scale in any individual case to show the certainty of a margin of profit before going to any expense in plant. At Mercur, Utah, tailings going as low as $1 per ton have been profitably treated. The details of such treatment have been given in these columns at considerable length in special articles written for this paper by those who successfully did the work.

IN treatment of ore by the cyanide process, the size of the leaching vats is usually determined by the amount of available ore. Ordinarily, there is economy of operation in the use of large vats, both in charging and discharging, and the securing generally of better results than could he obtained by treating the same tonnage of ore spread out in a number of small tanks. The tanks may be built of any substantial substance—wood, brick, masonry, concrete or steel. Usually they are circular in shape. For nine out of ten cyanide plants wooden tanks are satisfactory, especially where the tailings are discharged hy hand. Where there are large operations and the tailings are sluiced, steel tanks with side or bottom discharge gates are in use.

"FULLER'S EARTH" is a detergent formerly much used to remove the oil and grease from woolen goods and still in use to some extent for the same purpose. Its chief present industrial use is in refining oil. Unlike true clays, it is not miscible in water and does not become a soft plaster mass. When in dry lumps, it falls to pieces in water and remains as a granular powder. It has a brown, mottled color and a soapy feel, cuts easily without grit under the knife and leaves a polished surface. It adheres but slightly to the tongue. It is easily pulverized. It contains about 25% of water, 32% of alumina and 43% of silica, but the composition varies with different specimens and the mixture can not he regarded as a definite mineral species. It is found abundantly near Bakersfield, Cal., and elsewhere in the western part of the country, though Florida is the chief source of supply in the United States.

THE weight of water required by a condenser per pound of the exhaust steam varies with the water temperature. Each pound of water absorbs nearly one heat unit for each degree F. through which its temperature is raised. The temperature of steam corresponding to a vacuum of 24 inches of mercury, or twelve pounds per square inch, is 140°, but the actual temperature in the hot well at this pressure is nearer 120°. If the condensing water is warmed to 100°, which is about all that can be expected, the heat units absorbed by each pound of water raised from 40° are 60; but if the temperature of the water at the start is 70°, each pound can only absorb 30 heat units. A condenser just large enough in winter would thus be much too small in summer. As an absolute pressure of three pounds per square inch, or a vacuum of nearly twelve pounds per square inch, one pound of steam contains 1.015 latent units of heat, which it must give up when condensed. If each pound of water used in the condenser absorbs 40 heat units, about twenty-five pounds of water must be used per pound of steam condensed.

THE influence of copper in lead smelting depends upon the sulphur present. In smelting raw ore, copper pyrites loses about one-fourth of its sulphur, and fuses down into copper subsulphide or matte, into which other copper sulphides enter unchanged. If there is not sufficient sulphur present in the charge to convert the whole of the copper into cuprous subsulphide, the residue of the copper will be reduced to metal, and alloyed with the lead, forming a hard, heavy mixture that sinks to the bottom and closes up the passage of the lead well. Even when sufficient sulphur is present, this is likely to occur in concentrating copper-lead matte, carrying 12% and upwards of copper, if the slag is highly ferruginous. The reason is that in the presence of highly ferruginous basic slags some of the sulphur is taken up by iron, and an equivalent proportion of copper goes into the lead. When running on coppery ores, therefore, slags fairly high in lime give cleaner lead, and in such cases slags with an excess of iron are to be avoided. With a slag high in lime, and, therefore, melting at a high temperature, it may be reckoned that nearly one-half the sulphur not appropriated by the copper will enter the slag or pass off as gas.

LIME in boiler feed water occurs in two compounds that are scale forming, the carbonate, which is the commoner, and the sulphate. The latter can form a very hard troublesome scale. The first thing to do toward improving boiler feed water is to find out exactly what the trouble with it is. This is done by making a chemical analysis of it. If it is found to contain carbonate of calcium alone it can be got out of the water by heating the feed water to the boiling point when it will precipitate out, and with a little time for settlement be all removed. The sulphate can be removed by heating under steam pressure to about 400° F., when it will precipitate out. This is not of very practical application with a small boiler plant at a mine. The better way may be to make a change in the source of the feed water supply even at a considerable expense for installation of a water supply plant. If this is impossible the use of aluminate of barium offers a chemical means of getting rid of the sulphate of calcium and the carbonate as well. It is soluble in water, but with the calcium salts forms insoluble compounds which settle out of it and leave the water pure. The action of boiler scale preventives used in the boiler is to keep the salts in solutions so that they do not precipitate and form a scale.

"CONCENTRATES" is not yet advised as to the exact nature of the proposed white lead process of manufacture at the projected East Kootenay, B. C., plant, as noted in last week's issue. While most white lead is still made by the old Dutch process of slow corrosion, there are several new ways, one of the best being the Bailey method, as in operation at Jersey City, N. J., where the lead is melted in a big cauldron 10 feet above the factory floor, and run into a second smaller pot over a slow fire, which keeps it at an even temperature. At the bottom of this second pot is a short, horizontal, 2½-inch nozzle, which ends in a thin steel plate, perforated with about 200 tiny holes, through which the melted lead is forced by the hydrostatic pressure of its own mass, becoming immediately solidified as it falls through the air in fine fibers of about .01 inch diameter. It cools so rapidly that one can hold his hand in the stream of fine lead filaments which cluster in festoons around it. Bunches of this fiber are forked onto trays 5 feet by 3 feet, 5 inches deep, each tray holding about seventy-five pounds, piled in stacks or tiers, through which carbon dioxide makes its way from the bottom. As the trays are filled with the lead fiber they are momentarily immersed, singly, in a tank containing an 8% solution of No. 26 acetic acid; then, after draining on an inclined platform, they are piled in stacks of twenty over openings in the floor, through which the carbon dioxide ascends, while the temperature is kept at 100° F. At the end of three days of this process of corrosion the contents of the trays are flung into water, resulting in white lead so fine that little subsequent grinding is necessary, the creamy mass passing into a cylindrical screening apparatus covered with 120-mesh wire cloth, revolving, partially submerged in water. After thorough washing the white lead is dried for the market. There is a residue of about 8% unchanged lead, finely ground, and thus suitable for the manufacture of lead acetate.

The Detection and Estimation of Small Quantities of Gold and Silver.*

By LUTHER WAGONER.

For a number of years I have, at odd times, tried to perfect a method of assay sufficiently delicate to find and estimate minute quantities of gold and silver. The object in view was to examine rocks remote from veins or mineral areas, in order to test the probability of the lateral-secretion theory. Having succeeded in measuring approximately the amount of gold and silver contained in one cubic centimeter of sea water, I present a detailed account of the method employed, with some of the results obtained.

GENERAL METHOD OF ASSAY.—The use of purified lead without other flux, blowpipe methods, extraction by cyanide, and measurement of the beads by the microscope.

The method of testing is by cupellation. On a properly prepared cupel it is easy to cupel and find a bead of 0.002 mm. diameter. Such a bead of silver weighs about $\frac{1}{21000000}$ part of a milligram. A bead 0.02 mm. in diameter weighs about $\frac{1}{21000}$ mg., and a close approximation can be made to its weight. It is desirable that the lead used in the assay should be low in silver, so as to avoid large correction; but, as the parted gold requires cupellation with lead, it is essential to have the lead used of high purity. I have found the following method to give the best results of a number tried: Dissolve 500 grams sugar of lead in 1250 c.c. of water. Place in the center of the beaker a carbon rod for anode, and near the side a 4x9-inch lead plate for cathode. Attach one cell of a dry battery and leave it a week. The difference of potential in favor of the deposition of lead is about 0.1 volt; a small amount of lead is deposited which assays much higher in silver than the sample. The battery is disconnected and the solution is allowed to stand in contact with the electrodes for two months. It is then filtered, crystallized and preserved for use. Some of the crystals are ignited in a clean, iron spoon, and the mixture of lead and oxides of lead is kept for use in the work. A portion of the calcined lead is reduced before the blowpipe on coal without flux; a part of the resulting metal is set aside as a source of pure lead and the other part is assayed. The assays showed the lead to contain $\frac{1}{21300000}$ of silver, as a mean of several trials. By fusing any of the ordinary reagents with this lead and cupelling, a notable increase of silver is found. This is especially true for all sodium salts, cyanides and ferrocyanides, and, in a lesser degree, for the mineral acids, lime, barium and borax—boracic acid being the only reagent tested that did not show an increase of silver. A sample of Mercks C. P. carb. sod. (10 molecules H_2O) showed over 3 grams Ag per ton. A sample of KC gave per metric ton 2605 milligrams of silver and 147 of gold. This was a mean of several tests, and this sample was used in the assays reported below.

MEASUREMENT.—A microscope having powers of 40 and 60 diameters has in the eyepiece a micrometer ruled on glass. With the power of 40, one division is 0.02001 mm. The latter is practically the same as a division on the ivory scale used in quantative blowpipe work. For careful work, both powers are used and a mean of the readings taken. Thus, if a head read 7.35 on the 60, it should read 5.12 on the 40. Using sunlight and reading the greatest diameter of the shadow of the head, will usually permit readings to be made to .001 mm., or one-twentieth of a scale division.

THE FORM AND WEIGHT OF BEADS.—The form of head is the resultant of three forces, namely, gravity and the surface tensions of the metal and the litharge respectively. Experience has shown that if the cupellation be done in a uniform way, the heads will show a constant mutual relation of diameter, base and height. For small heads, under 0.5 mm. in diameter, the action of gravity is much smaller than that of the other forces; hence, the heads tend to approach a spherical form, and for ordinary purposes it is sufficient to measure the diameter only, without removing from the cupel. Concerning this weight there is much confusion; thus, in Cornwall's Plattner the weight of a silver head 1 mm. in diameter (No. 50 on the ivory scale) is said to be 3.48 mg. A few pages beyond is a table giving the weight of a similar head (but measured in a jaw micrometer) at 6.12 mg. A monograph by J. M. Curtis (6th Report of the U. S. Geological Survey) gives a table for beads measured by crosshairs and a micrometer stage, and based upon perfect sphericity at zero, with a decrease of 20% for a bead 0.46 mm. in diameter, and an interpolated formula to satisfy these conditions. To test the matter, I devised a clip made of a small watch-spring, as shown in Fig. 1, which is about full size. The inside at a, b, is polished for 0.25 inch. The head is cleaned and inserted between the jaws of the clip, the base of the head resting on b, slightly nearer the top than the bottom. The clip is placed on the stage and lighted from below. It should present an appearance like Figs. 2 and 3. The polished steel reflects the image and gives a sharp line, very helpful in measuring diameter, base and height.

A number of gold beads, varying in diameter between 0.1 and 3.3 mm., were separately weighed, and also measured in the clip above described for diameter (B) of base, diameter (D) of head, and height (H) of head. In order to deduce the volume from these measurements, the height (h) of the missing segment must be known. This can not be directly measured; but an expression can be found giving the volume of the head as a fraction of the imaginary completed figure.

Fig. 1—Watch-Spring Clip for Measuring Assay Beads.

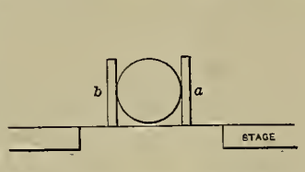

Fig. 2—Vertical Section, Showing Bead in Clip (Fig. 1).

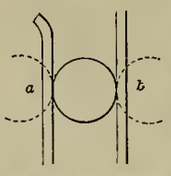

Fig. 3—Plan, Showing Bead in Clip (Fig. 1).

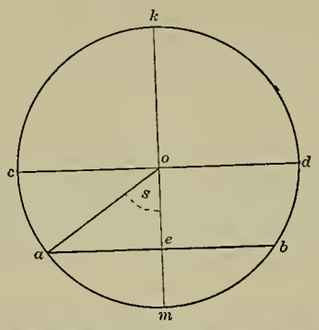

Fig. 4—Diagram Illustrating Calculation of Weight of Bead from Measurements.

In Fig. 4, ah = B; cd = D; ko + oe = H, and amh is the segment cut off. Assuming the completed figure to be a sphere, ko = om = co = od = oa = R, or radius of the sphere; and from inspection of the diagram it is clear that $\frac{ah}{cd}$ = sin. S (S being the angle aoe); and that ko + oe − H = R + cos. S.

The volume of the segment of a sphere, divided by the volume, is $3 \sin.^4 \frac{S}{2} - 2 \sin.^6 \frac{S}{2}$.

Calling this fraction P, the volume of the head ackdh can be expressed as (1 — P) vol. of sphere, on the assumption that the completed figure is a sphere. But this would never be the case theoretically and seldom practically (i. e., within the limits of practicable accuracy for the calculation here under consideration), for the obvious reason that the effect of gravity, and, possibly, of other forces, upon the liquid head must distort it from a perfectly spherical shape. In other words, km in Fig. 4 could seldom be safely assumed as equal to cd. Another factor must therefore be introduced to correct the error due to this lack of sphericity.

$$\text{In Fig. 4 } km = \frac{cd}{ke} H = \frac{2}{1 + \cos. S} H.$$

Denoting by Q the coefficient of H in this expression, we have, as the final expression for the volume of the head (1 — P) $Q \frac{\pi}{6} D^2 H$. The measurements being in millimeters, it is only necessary to multiply this volume by the specific gravity in order to obtain the weight of the head.

A number of heads weighed on a good balance 73.27 mgs. The same heads calculated by the above formula measured 72 61 mgs. One head of silver weighing 92 mgs. measured 91.463 mgs. Sin. S will not vary much if care be taken not to touch the head with the tip of the flame after it sets. In gold buttons the usual effect is to increase H and diminish D, thus giving too small a value if only D is read.

For heads too small to allow easy manipulation, the measurements are best made upon the cupel. For such work, where the scale division is 0.02001 mm., the value used is:

Weight = $D^3 \times 0.00007598$ for gold (log. = 5.8807)
and $D_3 \times 0.00004213$ for silver (log. = 5.6246).

This agrees with the value given by Curtis for silver where the diameter = 0.08 mm.

(D in the above formula is the number of scale divisions of 0.02001 mm. each)

The above constants were used in the reduction of all the tests tabulated in this paper.

FINE CUPELLATION.—Take elutriated boneash and grind it very fine in the agate mortar, heat to redness and preserve in a bottle. For the fine cupellation press in lightly ordinary boneash; heat it to expel moisture; then cover evenly with the fine ash and burnish with the smooth end of the agate pestle; heat carefully, and, before placing the head upon it, examine for cracks with a good lens. The cupel surface should be smooth and polished. The head of lead should not weigh more than 8 to 10 mg. and should be clean. As soon as fused, the head should be kept moving. When it gets too small to be seen, the stain of litharge on the cupel shows its locus. Care must be taken not to overheat near the finish. By carefully observing the above directions, 1 mg. of assayer's lead will show a small head of silver. (Suppose the lead to contain 0.1 ounce of silver per ton; then 1 mg. will give a head of 0.43 division or 0.00086 mm. diameter.

Should the assay be for silver only, the cupel is placed upon the stage of the microscope and the diameter of the button is read; or, if it is large enough to handle, it can be detached, placed in the clip, and the three dimensions measured for volume of gold and silver.

PARTING.—The diameter of the alloy is read and estimated as silver, after which it is parted as follows: Procure a supply of clear white cups or saucers of a cheap grade, which should be free from dark specks and which should stand the heat to be used without cracking or losing the assay; break into pieces about 15 mm. square and cement a piece with sealing wax to a strip of tin plate for a handle, placing the concave side uppermost. Clean the surface of the porcelain with nitric acid and wash it, leaving a drop of water on it. Place the cupel near it, and with the aid of a lens and chisel-pointed needle detach the head. With a fine splinter of wood, previously wetted, touch the head and transfer it to the drop of water. Should the head be too small for a hand lens, take a fine needle; amalgamate the point with sodium amalgam, and, having the head in focus on the stage, touch it with the point of the needle. Sufficient mercury will adhere to render the head visible, and it can then be treated like a larger head. With a capillary tube or dropper, add nitric acid very cautiously, warming the assay until the silver is seen to blacken and dissolve slowly. The gold will remain in a coherent mass. With a strip of filter paper remove the acid; add strong acid, and warm again, after which the assay is washed sweet and dried. With small amounts of gold great care must be taken to have a clean white surface to work upon, and dust must be kept away, otherwise it will be difficult to see and recognize the speck of gold.

Some of the calcined purified lead is reduced without flux on coal and can be kept in a clean box for use. Cut from it a small piece of 2 to 3 mg. weight; flatten it with the agate pestle and turn up a corner for a handle. With the forceps cover the speck of gold and gently press down the lead. Next heat the corners of the porcelain before the blowpipe, carefully working inward to the test, and fuse the latter; after which scorify the bead over the area covered by the lead when laid on, and cool. The head detatches easily and with a clean bottom. Examine the head with the lens to see that it is clean, and cupel as before directed. As gold will stand a high heat, it is advisable to measure, and, if there is any irregularity, reheat to melting point.

By observing the above directions, I have made heads which I estimated at $\frac{1}{10}$ of a scale division. The head was perfect in form and color, and, with higher powers, could easily have been measured with much precision. Such a head is calculated as follows, according to the formula, weight = $D^3 \times 0.000759$; D being 0.1 of a scale division.

Log D = 0.1	9.0000
	3
Log D^3	7.0000
Log constant, 0.000759	5.8807
Log weight	2.8807

Weight = 0.0000000759 mg. = $\frac{1}{13100000}$ mg.

It is readily seen that we have here a method at once simple and delicate for detecting the presence and estimating the amount of the precious metals.

THE PROBABLE ERROR.—As previously stated, the diameter of the head can be read to 0.001 mm. Calling this the error, and taking the weight as KD_3 (K being a coefficient) and its differential as $3KD^2$ (.001), we have as the per cent of error:

$$\frac{3KD^2 (0.001)}{W} = \frac{3KD^2 (0.001)}{KD^2} = \frac{0.003}{D}.$$

The following table shows the weight of gold heads and the probable error:

Weight, mg.	Error, per cent.	Weight, mg.	Error, per cent.
0.1	1.36	0.001	6.36
0.01	2.95	0.0001	13.69

CUPELLATION LOSS.—A sample of about 331 mgs. of assayers' sheet lead, cut into small squares, mixed and cupelled, gave a head covering 6 divisions, or 12 mm. in diameter. A sample of 41 mgs. gave a head covering 3 divisions, and one of 5.2 mgs. a bead of 1.5 divisions, thus proving that there is no sensible departure in the proportion of loss for small heads

*Trans. American Institute Mining Engineers, Mexican meeting, November, 1901.

from that of larger ones. Hence, in what follows, I have deducted the silver due to the lead cupelled and called the remainder the true amount.

CYANIDE ASSAYS.—A sample of cyanide of potassium was tested by evaporating 2 grams with 10 c.c. of water and 6 grams of calcined lead. The dried mass was fused on a clean coal and the resultant lead was weighed, cupelled and the button parted. The value found as a mean of several trials was: Silver, 2.606 grams, and gold, 0.147 grams per metric ton. A 1% solution was made and kept for use. The general method was to take 40 grams of finely pulverized material, with 10 c.c. of KCN solution (= 100 mgs. KCN) and 50 c.c. of distilled water; place all in a flask and shake well, repeating the shaking at intervals of one or two days; then filter on a dry filter into a graduated vessel; note the c.c. used for assay, transferring into an evaporating dish; add 400 mgs. of calcined lead and evaporate. The residue was then fused on a clean coal, the lead being weighed and cupelled and the button parted, as above described.

This assay is made more certain by beating the coarsely pulverized rock to redness, quenching in water, evaporating to dryness and then pulverizing, taking a sample for assay and grinding it in an agate mortar to a fine mud, and using a cyanide solution of ½%, after which the whole is transferred to a flask and made up to the desired weight of cyanide solution. The weighed sample of ore is triturated with only sufficient cyanide solution for the purpose of proper grinding. When it is transferred, as above described, to a tared flask, the pestle, mortar and funnel are washed into the flask with either cyanide solution or water. It is desirable to have a known weight or volume of cyanide solution in the flask, because it will be filtered upon a dry filter, and usually some aliquot part of the original solution will be assayed. Ore can be pulverized finer in this way than by the dry method. The assay is usually made alkaline by this treatment—a result which is beneficial for cyanide work.

ASSAY OF SEA WATER.—I have long thought that the sea water was the chief source of gold and silver and that some effort should be made to ascertain the facts and thus know what are the chances that the sedimentary rocks have been impregnated with small amounts of gold and silver. I have verified the statement of Sonnstadt that a small portion of $BaCl_2$ will throw down a portion of the gold; also the statement of Dr. Don that heating the salts to redness and redissolving and assaying the residue would recover most of the gold. I have also evaporated to dryness, and find that after dissolving in water the residue carries a notable amount of gold and silver; also, evaporating, or, rather, boiling with calcined lead acetate, fixes a larger amount of silver and some gold. The highest results were had by evaporating 1 to 10 c.c. of sea water with 200 mgs. of lead c.c., and fusing on coal; but the results were not concordant nor uniform, probably due to difference in heating and to volatilization of the silver. The gold was tolerably constant by this method; 500 c.c. were evaporated to dryness, redissolved in a minimum of water, and, while boiling, a 2% solution of $BaCl_2$ was added drop by drop to slight excess and again evaporated to dryness. The salts were beated to a bright red for ten minutes and redissolved and filtered; the ppt. of barium sulphate and some lime were placed in a flask with some water and a drop of phenolphthalein. It required four drops of lime water to produce a permanent color showing alkalinity. The solution was made up to 25 c.c., containing 40 mgs of KC, and shaken at intervals for a day—filtered and washed and the filtrate evaporated with 400 mgs. of lead and the assay made as described. There were two assays made, which showed as follows:

CYANIDE METHOD.—Found per metric ton of water:

	Mgs.
Gold	10.9
"	11.3
Mean	11.1
Silver	165.
"	174.
"	179.5

A portion of the filtrate containing the chlorides was then assayed directly with lead, which gave for Ag 1010, 1241 and 1164 mgs. per ton. The three beads were then cupelled together and parted. There was a small bead of gold estimated at 1.5 mgs. per ton, from which I conclude that the amount present in this sample was 12.6 mgs. of gold and not less than 1.500 grms. of silver per ton. Dividing by .02756, the amount of salts in the sample, it becomes per metric ton of salts:

Gold, mgs	457
Silver, grams	54.4

and for normal sea water, containing 3.5% of salts, 16.0 mgs. gold and 1.9 grams. silver. (NOTE.—Several tests showed a much higher value for the silver.)

Sea weed and floating organic matter were tested by washing sweet, calcining and cyanide. In some cases large amounts of silver were found. Samples of the bay mud taken from the dredgers gave from 3 to 18 cents in gold per ton. A sample of mud from Islais creek channel, which is very foul from sewage, gave a very high assay in silver. Samples of organic matter taken near sewer outlets assayed higher in silver than samples taken at more remote points.

As a result of the numerous tests made, I think it can be safely affirmed that organic matter reduces some silver from the sea water and probably some gold. The latter cannot be positively known, because the gold may have been carried in suspension and have become attached to the object assayed; but the method described might be used to examine organic matter taken at a point free from coastal influence. Personally, my views, based upon my work done, are that the sediments as deposited are enriched by the reducing action of organic matter and that the newly formed stratum of mud contains not only the gold and silver due to the water present, but also some additional amount reduced by the organic matter.

ASSAYS OF ROCKS.—The statement by Dr. Don that country rocks can be assayed by panning down a quantity and assaying the residue has been tested, as well as the statement that pyrite must be present in order to find gold; and my experiments show that both statements are incorrect, or, at least, not in accord with my experience.

I have found that grinding poor quartz ore in an agate mortar to a fine slime, and removing the slime by water from time to time, is a very delicate test for gold. Most of the samples assayed were thus tested and showed no gold. The method used for most of the samples was to crush to 60-mesh sieve, take 40 to 50 grms. of ore and 60 c.c. of water containing 100 mgs. of KC. The stoppered bottle containing the assay was well shaken at intervals for a day or two, filtered on a dry filter and the filtrate measured and then evaporated with 400 mgs. of calcined lead acetate and fused on coal b.b., as described. In these assays there are but two fluxes added—the lead and the cyanide—and, as both have their tenor known, great confidence can be placed in the result. As an example, take No. 10, sample of Carrara, Italy, marble: Weight taken, 45 grms. + 60 c.c. water + 100 mgs. KC.; time, two days; take 42 c.c. of solution for assay. Weight of Pb reduced 340 mgs.

Diameter of Ag Au bead, 5.45 divisions = 0.109 mm.
" Au " 1.55 " = 0.031 mm.

The following table comprises results of assays of rocks taken remote from veins or known regions of mineral values. The results are reported in milligrams per 1000 kilograms of ore assayed:

1. Granite. Porcupine Flat, near Lake Tenaya, Cal., Au, 104; Ag, 7660.
2. Granite from Lake Tenaya, Cal., Au, 137; Ag, 1220.
3. Granite from headwaters American river, Cal., Au, 115; Ag, 940.
4. Syenite from Candelaria, Nev., Au, 720; Ag, 15,430.
5. Granite from Candelaria, Nev., Au, 1130; Ag, 5590.
6. Sandstone from Colusa county, Cal., sample from Hayward Building, Au, 39; Ag, 540.
7. Sandstone from quarry, Angel Island, Cal., Au, 24; Ag, 450.
8. Sandstone from Russian Hill, San Francisco, Cal., Au, 24; Ag, 320.
9. Marble from Columbia quarry, Tuolumne county, Cal., Au, 5; Ag, 212.
10. Marble from Carrara, Italy, Au, 8.63; Ag, 201.
11. Basalt paving block from Petaluma, Cal., Au, 26; Ag, 547.
12. Diabase from Mariposa county, Cal., Au, 76; Ag, 7440.

From the above assays it is seen that the average silver is about twenty times that of the gold, or, excluding Nos. 4 and 5, the ratio is about 30 to 1, and this high ratio tends to confirm the belief that the gold and silver were deposited with the rock and have since remained with it. Assuming that the water has an underground circulation, then the source of the gold and silver can be found in the country rocks, and we need not go to the unknown regions below for a source of supply. It should be remarked that the above assays by cyanide do not purport to be the value of the rocks, but only of the amount extracted. Some check work on one of the samples showed 20% more by calcining and grinding to a fine mud. I have also found the above methods useful in cyanide tests, notably in experimental work for testing the rate of solution; from a definite amount of solution 1 to 5 c.c. is taken, and either evaporated with lead or the gold is precipitated by $AgNO_3$, and the precipitate reduced and parted, and estimated as above. The method, of course, requires some calculation for the amounts subtracted from time to time; but, on the other hand, it is all from the same sample.

The method is of great value in tests in regions remote from assay offices. One gram of properly prepared sample treated either by direct fusion or a larger amount amalgamated, and direct fusion of 0.5 gram will closely check the ordinary fire assay on ores as low as .2 ounce Au per ton.

IN the electric furnace aluminum oxide is not reduced by carbon, but if lime be added calcium carbide is formed. It has been discovered by experiment that this reduces alumina; also that the yield of aluminum is increased by the presence of free carbon. The heat should not be applied longer than fifteen minutes, for by that time aluminum carbide is formed.

Gleeson Camp, Cochise County, Arizona.*

[STAFF CORRESPONDENCE.]

Gleeson camp is near the southern terminus of the Dragoon range, 20 miles northeast of Tombstone, 14 miles south of Pearce, and 30 miles south of Cochise. The camp was started about four years ago, when John Gleeson located there a group of claims and opened what is now the mine of the Copper Belle M. Co., from which shipments amounting to about 800 tons per month of 8% copper ore have been made during the last two years. The ores also carry small values in gold and silver.

The ore bodies trend north and south, along the southern slope of the range, and are in a porphyry formation. The ores from the surface down to 75 and 100 feet depth are oxidized and consist of cuprite, azurite and malachite. From about the 100-foot level down to 300 feet, present depth of workings, the ore is largely chalcopyrite. As depth is gained the per cent of iron decreases, the gold carried increases and in places there are bodies of steel galena.

The present working shaft sinks 300 feet on an incline, but a vertical four-compartment shaft is being sunk in the more central part of the group. On the 70-foot level are drifts and crosscuts showing the ore to be about 100 feet wide. From here stopes have been carried to the surface for considerable length. On the 100-foot level there are drifts running 400 feet with the vein, with numerous 100-foot crosscuts in ore. A winze sinks from the 100 to the 200 level with stopes started from it at about every 25 feet. All ore between the 100 and 200 levels is sent down the latter through chutes, thence in cars to the shaft. There is a continuous stope from the surface to the 200 level, though below the 70 the stopes do not extend far on the strike of the ore. The stoped ground is timbered up in square sets.

The new shaft will be equipped with two cages and a large hoist. The principal stockholders of the Copper Belle are New York men. On the property is a small-tonnage matte smelting furnace, in which some test runs have been made. On the operating force are John Gleeson, superintendent; Wm. Shaw, day foreman; Nelson Stevenson, night foreman; George F. Reckhart, assayer, and F. R. O'Brien, storekeeper.

The Turquoise Copper M. Co. have a group of claims covering an ore body parallel to that of the Copper Belle, but higher up on the mountain than the latter. The developments on the Turquoise amount to considerable, there being three shafts 250 to 300 feet deep, with gasoline hoists at two of them. From these shafts crosscuts run eastward to ore, with levels along the course of the vein. At points higher up the ledge is opened through two tunnels. They have here a fair showing of copper carbonates in the crosscuts at 150 feet depth. Some shipments have run as high as 20% copper. The ore thus far is in small shoots and hunches. In places there is considerable lead carbonate. On two of their claims they have gotten into copper sulphides. The principal stockholders in this company are McKittrick, Tevis and Ryan Bros. Thomas Lawry is superintendent.

About 3 miles from Gleeson are several claims owned by Jack Mitcheson and Mike O'Connors, who have uncovered quartz veins bearing free gold. They have a 150-foot shaft, from which a crosscut runs to the ledge. The illustration on the front page shows Gleeson camp, with the hoist of the Copper Belle mine in the foreground.

Gleeson, Ariz., Jan. 8.

Operations at Globe, Arizona.*

[STAFF CORRESPONDENCE.]

The copper mines of the United Globe Co., at Globe, comprise the Buffalo, Josh Billings, Gray and others, which extend northeastward along the well-known globe copper belt. The ownership of this group is practically the same as that of the Copper Queen property at Bisbee. The Globe plant includes a smelter which is not now operating and shipments from the property are chiefly to furnish the Copper Queen smelter with part of its supply of siliceous ore. In the original workings of the Buffalo and contiguous ground it is shown that the oxidization extended to great depth, iron oxides coming from workings on the 700-foot level. The Buffalo has been worked mainly through a system of tunnels and the carbonate ores, above water level, are said to be pretty well worked out. More recent development, which is at the Gray shaft, is for the purpose of sinking below water level to get, if possible, into the sulphide ores. The Gray shaft is some distance northeast of the Buffalo, on the same belt. It is three-compartment and already 720 feet deep, in the foot wall formation, with crosscuts to the ore body, and drifts in ore about 2000 feet on vein at second and sixth levels. Water level is reached at 540 feet, where there is a station pump.

The property is provided with good hoisting facilities and machine shop. Some sulphide ores are ob-

*See illustration on front page.

tained in the lower levels. N. S. Berray is superintendent.

The Arizona Commercial Co. are developing the Copper Hill group, which adjoins the United Globe on the northeast. Their 450-foot shaft is 1500 feet from the Gray shaft and on the same helt. They have about 1000 feet of drifting on the second, third and fourth levels. From the surface down to near the 300 level the ores were carbonates and oxides; hut from the 300 down to present depth the work has developed a good grade of chalcopyrite ore. The shaft will he sunk to 600 feet depth. The character and extent of the sulphide ores struck here is considered important to the entire district. In 1900 about eighty cars of oxidized ores were shipped from the Copper Hill which are said to have netted about $1000 per car. The sulphide ore body opened here is stated to he 8 to 15 feet wide.

Globe, Ariz., Jan. 13.

Plans and Measurements of Capability.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

Soou after graduating from the Sheffield Scientific School I was set to making reports on manufactures of machinery, which were duly puhlished in volumes II and XXII of the U. S. Census of 1880. Among my colleagues in this work was (now) Dr. Herman Hollerith, who had just graduated from Columhia School of Mines. We were hoth quite modest, and awfully impressed with the responsihility thrust upon us by a paternal government, and Hollerith argued that we should resign to persons hetter qualified, captains of industry in steel and iron. I argued that most of these fully experienced men were fully occupied at much better salaries than the Government was ahle to pay under the census appropriation, and that our justifiahle role was to go about as young reporters seeking to tap the accumulations of other men's knowledge, and hand the draught to the puhlic. In this we met some success, but sometimes met wise and secretive people like Mr. Cramp, of shipbuilding fame, who told us pleasantly hut firmly that he knew how to huild ships, and did not care to have other people learn how at his expense. We, though young, had no private commercial reasons for withholding anything that we could learn, and the same applies to all candles, however small, that attempt to illuminate a subject. They should he allowed to shine though larger lights outshine them, and especially so if these greater luminaries keep under shades.

Many years later, and not very long since, another similar incident stiffened my nerve. I had just come from the Chicago Art Museum, from Verestchagin's pictures of the horrors of war, and thence through several galleries of colossal statuary, hut I was thinking if I should have the presumption to offer the ideas here written to the readers of the MINING AND SCIENTIFIC PRESS. Going down Michigan avenue hy the lake front I observed a colossal female figure which in dignity and heauty yielded nothing to the examples of Greek art. It stood upon the cupola of a fountain, around which I walked to get the full inscription upon the frieze: "Presented by Joseph Rosenhaum of San Francisco." I do not know the donor, hut in its purity and simplicity his was a worthy gift. It lessened the distance between Chicago and San Francisco, and gave me countenance in the idea that a Chicagoan should not be deterred from expressing his hest free thought on engineering studies in the presence of the experienced miners of the golden coast.

Capahility and incapahility assist in defining each other. I am not one of those who would say that one man was capahle, and another incapahle—the Lord have mercy upon him!—and leave him to the awakening of miracle and fate. Each has its recipe, and either may be made according to rule as a good or poor mill may he huilt according to plans.

The first essential of incapability is disconnection. The incapahle man is not geared up, not in the running. His mental processes have no go in them. Thought is in the awkward squad. It toes in, stares without seeing, is paralyzed in stupor, or galvanized into erratic action. One of the most painful spectacles I have witnessed was that of a poor man set to tend a machine with which he was unfamiliar. It was at Colt's Armory. Times were hard. He wanted to hold the job, and was seized with desperation for fear he could not. The foreman was not unkindly. "Think, man," he said, "it is not difficult if you will only observe." But he could not. There were stupid, spasmodic acts, false motions unaided hy intelligence, wild, despairing looks. At last they had to lead him away. A hypnotist might have started him all right. There are a good many jobs on which a hypnotist could increase the output.

Just as a hasket holds articles and the frame holds the pieces of mechanism, capahility holds incapahility. One of the earmarks of ahility in my line is considerateness for the less capahle. The man whose mind is clear and his mental processes in good working usually takes a certain pride in assuming hurdens which demonstrate his superiority. It suits the humor, for most forms of pleasing humor are exposures of other people's ignorance of things in which we are wise.

Considerateness is etymologically written "in the stars." It is instinctively of reserve force and superior power. A joh machine shop without the most adequate equipment is a place which in the words of an apprentice "tries the wits of the hest of them." That remark was made in a shop on the Atlantic seahoard, hut the young man who made it now has a shop in San Francisco.

"Our army swore terribly in Flanders" has hecome a familiar quotation. When I went from a genteel shop in the East to a very rough one in Ohio, I was fairly sickened hy the prevalence of the Flanders hahit. But when a man restrains his temper, and rises superior to his hard lines in the shop, he is very superior. The most courtly man I ever met, har none in state or set society, was a skilled machinist and superintendent. It was a pleasure to take his instructions, or to see him working with others.

I was once being shown a gear cutting machine hy a mechanician of world-wide reputation—the head of a tool-making firm. I cite this incident to show the almost tender patience of some capahle managers with mental confusion in others. The lad tending the machine, heing suddenly addressed, became confused, jammed a firmer into the machine the wrong way, flushed and looked emharrassed. The employer called me away instantly, and after I had followed him down a flight of stairs, not knowing what the matter was, he brought me up with the remark: "That poor hoy; he won't get over it for a week." I was slow to understand this regard for the feelings of a hoy where I was looking for nothing but an austere regard for mechanism. Had he not cares enough without concern for the state of mind of a hoy. It seemed not. This solicitude was part of his capahility.

Capahility is utilitarian culture. I define culture as the construction of systems which give us hy likeness and difference a great wealth of comparisons. The selfish person, the accutely self-conscious person has no hold hy which to escape from his own confusion of mind, in which inability he is like a crying child in a pit, from which he can only climh hy outside aid. The man must have an out-reaching mind. Only outside of himself can he get systems of comparison. Only by putting himself in the places of others can he get the mental experience, which is nothing more nor less than making canals for thought to flow in. We appreciate a Nicaragua; that canal is a great physical fact to he accomplished hy the expenditure of much lahor and money. But the thought canal which opens a man's mind to new power and a new world is left to "happen" by some convulsion of nature. I say that it can he dug and dredged by art, and that the methods of transforming a dull, incapahle into a wise, skillful mind is an engineering work in which definite courses with much lahor produce great tangihle results.

Unselfishness is not a sickly moonshine of morality. It is a lever of power to be used without sentimentality. The man who goes to the hottom of lowly things is not to he weakly approved for his humility, hut to he applauded for his engineering ahility. I have more respect for a man who has the motive and wit to prepare a "mucker's guide" than for one who, moved by the fading ideals of the past, is led to charge up the Hill of San Juan, and write a hook of "I and Me" about it.

Metals That Radiate Energy.

There ane many stores of energy in nature that may he d · wn on by properly constituted hodies without very ohvious cause. Some time since I drew attention to the enormous amount of locked-up energy in the ether. Nearer our experimental grasp are the motions of the atoms and molecules, and it is not difficult mentally so to modify Maxwell's demons as to reduce them to the level of an inflexihle law and thus hring them within the ken of a philosopher in search of a new tool. It is possihle to conceive a target capahle of mechanically sifting from the molecules of the surrounding air the quick from the slow movers. This sifting of the swift-moving molecules is effected in liquids whenever they evaporate, and in the case of the constituents of the atmosphere wherever it contains constituents light enough to drift away molecule hy molecule. In my mind's eyes I see such a target as a piece of metal cooler than the surrounding air, acquiring the energy that gradually raises its temperature from the outstanding effect of all its encounters with the molecules of the air about it. I see another target of such a structure that it throws off the slow-moving molecules with little exchange of energy, hut is so influenced hy the quick-moving missiles that it appropriates to itself some of their energy. Let uranium or polonium, hodies of densest atoms, have a structure that enahles them to throw off the slow-moving molecules of the atmosphere, while the quick-moving molecules, smashing onto the surface, have their energy reduced and that of the target correspondingly increased. The energy thus gained seems to he employed partly in dissociating some of the molecules of the gas (or in inducing some other condition which has the effect of rendering the neighhoring air in some degree a conductor of electricity), and partly in originating an undulation through the ether, which, as it takes its rise in phenomena so disconnected as the impacts of the molecules of the air, must furnish a large contingent of light waves of short wave length. The shortness in the case of these Becquerel rays appears to approach, without attaining the extreme shortness of, ordinary Roentgen rays. The reduction of the speed of the quick-moving molecules would cool the layer of air to which they helong, but this cooling would rapidly he compensated hy radiation and conduction from the surrounding atmosphere. Under ordinary circumstances the difference of temperature would scarcely he perceptihle, and the uranium would thus appear to perpetually emit rays of energy with no apparent means of restoration.—Sir William Crookes.

Notes on Testing Cyanide Solutions by Silver Nitrate.

Written for the MINING AND SCIENTIFIC PRESS by B. W. BEGEER.

Several authorities have pointed out that the ordinary methods for testing cyanide (free) in impure mill solutions do not give accurate results.

In order to find, however, a method which will give results reliable enough for ordinary practice, I made a large numher of tests on a pure cyanide solution, and several different working solutions, from the MacArthur–Forrest process.

In each case 10 c.c. of the solution was taken, exactly measured from a hurette. The tests were made undiluted and diluted, with and without KI as indicator, and also slow and quick titrating.

The results of these tests on the pure cyanide solution were practically all the same.

With the mill solutions, however, important differences were found, which brought me to the following conclusions:

The addition of KI as indicator makes the end reaction often indistinct and the results, as a rule, too high. Only in one case was it found that the addition of KI gave hetter results, and that was when the cyanide solution was exceptionally alkaline.

When the titration is done slowly the results will he too low. The differences hetween a slow and a quick titration are, however, not very large.

The following method gave the hest results: Drop into a perfectly clean flask 10 c.c. of the cyanide solution and 15 c.c. water. The solution must he perfectly clear, otherwise it has to he filtered until clear. Do not add any indicator. Titrate, not too slow, with AgNO3 solution (6.535 G AgNO3 in 1000 c.c.), keeping the solution in the flask in agitation all the time, until the solution is not more perfectly clear, hut is slightly turhid. The change from perfectly clear to a faint opalescence can be easily distinguished hy holding the flask against something hlack.

This method will give for actual practice sufficiently accurate results.

Cost of Compressed Air Hauling in a Mine.

In a paper on "Compressed Air Haulage Plants," read hefore the Engineers' Society of Western Pennsylvania on Novemher 19, 1901, Richard Hirsch gave some interesting data on the cost of hauling in a mine hy compressed air locomotives where the hauling was formerly done hy mules, of which over thirty were used. The present motive power equipment consists of two compressed air locomotives, cylinders 7x14 inches, tank capacity 130 cuhic feet, tank pressure 500 pounds per square inch, weight of each locomotive 16,000 pounds. During the year 1897 the plant was operated a total of 179 days. The cost of operating for the year 1897, and the corresponding cost of the old style of mule hauling, is summarized thus:

Total cost of plant, except steam boilers, cars and track	$15,156 00
Operating expenses, including all labor, fuel, supplies, repairs, etc	2,202 78
Fixed charges, including interest, depreciation and renewals	1,776 60
Cost of mules required for same work	4,052 48
Cost of operation by mules, including labor, supplies, interest, depreciation, etc., for 179 days	11,328 63
Cost of operation by compressed air	3,979 38
Saving by use of compressed air	$ 7,349 25

At this rate of saving the entire cost of the compressed air plant would he saved in 361 workings days.

The average daily work of these two motors during the period of 179 days referred to 1185 net ton miles, or the cost of hauling was 1.9 cent per net ton mile. The corresponding cost of hauling hy mules would he 5.34 cents per net ton mile. Had the compressed air plant been operated for 300 days in the year, instead of 179 days, at the same daily rate of work, the cost per ton mile would have heen considerahly less than that given ahove.

REAL GENIUS shows itself, not in the multiplication of petty details, hut in the assimilation of existing materials and their incorporation into a broad and comprehensive design. An engineer shows his ahility hy utilizing what materials he finds ready at hand, rather than hy the creation of special forms a little different from what has heen used hefore.

Water Supply Works for Mines in the West.

Dams aod ditches in the West always suggest the placer gold mines as original incentive for most of the coostructions, even though they may no longer he used for placer mining. The illustratioos are of typical constructions. Dams are huilt and reservoirs made in even quite small streams and valleys. In proportion to the service exacted of them they are as usfeul as the more pretentious and costly structures huilt in other localities. The miner, as a rule, huilds for his mine. He expects to work his mine out some time aod so does not huild his ditches and their head works to he imperishahle. They are sufficient if they last the life of his mine. The mountains in the West are handed with old ditch lines for the most part ahandoned for so long a time that the history of their construction has become lost.

Sidehill Coostruction of an Idaho Canal.

The Headgates of an Idaho Canal.

The Idaho canal and its headgates, illustrated herewith, are of later and more permanent construction. Sidehill ditch huilding is a special hranch of the art. Experience with ditch building on level lands gives very little assistance. The latter is nearly always io earth, where the former is very largely rockwork. There is little chance in sidehill coostructioo to use the excavated spoil to make a ditch hank against which the water can rise. The full depth of the flow, as shown in the illustratioo, must he in excavation. The wooden headwork structure is a survival of old methods and appliances. The later tendeocy is to use stone or coocrete aod make the work permanent and secure against destruction hy high water.

Dam and Reservoir on Parley's Creek, Utah.

The Discovery of Havilah, Kern Co., Cal.

To the Editor:—The writer early in 1864 noticed the indicatioos of a gold-bearing formation in the Clear Creek country when crossing it from Beals ranch to Kernville. At Kernville I engaged three men to go with me to prospect it. The distance was 20 miles, and it took us all day to make it with our outfit, and we camped at night on the Copperas branch of Clear creek, ahout the middle of where the town of Havilah was huilt. While the men were getting hreakfast, I went out prospecting close hy and in half an hour had discovered three veins of quartz showing gold. This was the heginning of the Clear Creek excitement of that year. We and others discovered ahout 200 ledges of free-milling gold-hearing quartz, some of which proved to he very rich and productive. Several hundred thousand dollars was soon invested in the mines. Shortly after the discovery we called a miners' meeting and organized the district as the Clear Creek mining district and elected Scott George, who was one of the men taken in hy me, recorder. Our laws made the charge for recording a quartz claim $5, a water right $10 and a town site $25. I located and named the town of Havilah and paid the recorder $25. Many mining towns in California were located and title secured in the same way on unsurveyed land. I consulted T. W. Freeman, a lawyer, then located at Visalia, and also State Senator from Tulare county. He told me that, as we had followed the then prevailing mode of securing town sites in California on unsurveyed land, our title was good. He afterwards hought a lot and erected a 20-stamp custom mill. Later we had Tulare county divided and Havilah made the county seat of the new couoty of Kern. At that time the miners were in the majority. Later the farmers got the majority and moved the seat to Bakersfield.

Placerville, Feh. 5. A. Harpending.

The Treatment of Clay Slimes by the Cyanide Process and Agitation.*

By E. A. H. Tays and F. A. Schiertz.

In 1893 the Aoglo-Mexican Mining Co., Limited, purchased the Guadalupe and adjoioiog mines, and, after opening up the Guadalupe, constructed a 20-stamp mill, which was started in August, 1894.

Although the results were extremely profitable (the ore heing very rich and carrying much free gold) they were not satisfactory, because the tailings were found to average ahout $20 per ton in gold. Early in 1895 the late James E. Mills made for the company a very thorough study of the suhject, and decided that the tailiogs could he treated most advantageously hy the cyanide process. In view of this opinion, Henry R. Batcheller, of Boston, was sent down in the winter of 1895-95 to experiment on a working scale. Mr. Batcheller was successful; and, duriog 1896-97, huilt a cyanide plant with a capacity for treating 1500 tons per month.

This was run until May, 1899, when all the sands suitable for the process had heen treated. The mill was stopped ahout the same time for lack of ore; hut no tailings from the mill had gone to the dump since Octoher, 1897, as the values they contained after that date were far too low to warrant further treatment. Wheo the cyanide plant was stopped there still remained on the dump ahout 16,000 tons of slimes, consisting of ahout 75% of clay slimes and 25% of sand slimes. The successful treatment of this very unfavorahle material is the theme of this paper.

Character of the Slimes.—The slimes under consideration comprised those naturally separated from the sands at the far side of the dump, and also those mechanically separated from the sands during the first run of the cyanide plant and returned to the dump. Of the 16,000 toos, 75% were, as already ohserved, purely clay slimes of the consistency of putty. All of this material would pass through a 400-mesh screen; and, although it had weathered for five years, and still contained from 18% to 20% of moisture, at least 80% of it had heen unaffected hy oxidation. There was evidently an ahsolute lack of capillary passages in it. That material which was more or less mixed with sand slimes, or surrounded the outer edges of the main dump, or lay in piles of clay halls or clods, screened from the sands treated hy percolation, was considerahly more affected hy the weathering; and the degree of extraction reached in treating it was fully 10% hetter than after we got well into the main pile. The remaining 25% of the total consisted of sand slimes, most of which would pass a 200-mesh screen. These were found in isolated hunches ahove and in thin seams helow the clay slimes. The original tailings were very fine, although the ore had heen crushed through a screeu of only 40 meshes to the linear inch. Tests made hy J. A. Edman, of Quincy, Cal., gave: sands, 49%; slimes, 51%. Of the sands, 10% passed over a 50-mesh screen; 30% over 50 to 100-mesh; 27% over 100 to 200-mesh; and 33% below 200-mesh.

Of course, the slimes (51% of the total sample) were all helow 200-mesh in fineness; and it was stated that 80% of these would pass a 400-mesh screen.

The original ore had consisted of quartz, white or reddened with iron oxide, and a lime rock (calcite), more or less mixed with decomposed country rock (andesite) from the walls and from fragments incased in the ledge proper. This ore carried much free gold, some free silver at times, lead and copper sulphides carrying gold and showing much free gold, zinc-hlende, copper and iron pyrite, and copper carhonates. The original ore also undouhtedly contained alumina; for aluminum, which had evidently heen dissolved, as well as gold, silver and copper, hy the cyanide, was found hy analysis in our precipitates.

The original samples of the tailings showed no trace of alumina—doubtless hecause they were taken, as already remarked, from near the launder discharge, which would naturally he nearly pure sand; the slimes and clay heing washed over to the far edge of the pond. Nor did those ore samples show alumina which represented only the metal-hearing quartz. But a large part of the vein material was replaced country rock, with hunches of altered country rock, all carrying gold; and in this was found the aluminum oxide.

This ore, treated hy plate amalgamation, yielded ahout 72% of its gold and 45% of its silver contents, and ahout 1.5% of concentrates, containing most of the lead, zinc and copper sulphides and iron pyrites, and part of the iron, lead and copper oxides, and a good part of the remaining gold contents (not caught on the plates, hy reason of hydrated oxide coatings or adhering particles of iron oxide and quartz).

The slimes, as run onto the dump, contained, hesides quartz, clay, etc., principally ferrous and ferric oxides (constituting 80% of the mineral contents), pyrites, minute portions of lead and copper sulphides, a little copper carhonate, and ahout $13 gold and 1.33 ounces silver per ton. The gold was in minute particles—under 0.0025 inches in diameter—

*Trans. American Institute Mining Engineers, Mexican meeting, November, 1901.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCHISE COUNTY.

Surveyors are surveying the grounds for the Calumet & Arizona smelters, near Douglas.

It is announced that Phelps, Dodge & Co. have decided to locate their smelting plant at Douglas, 28 miles from Bisbee. Plans are now being drawn and it is expected that it will be at least eighteen months before the complete change has been made. The plans call for a plant with a capacity of 1000 to 1500 tons of ore daily. Supt. Douglas, at Bisbee, states that he is about to close up large contracts for the new machinery. It is the intention of the company to bring refractory ores from Globe and Nacozari and smelt them at Douglas. It is not the intention of the company to erect refineries in Douglas.

GILA COUNTY.

W. M. Williams has bonded at $20,000 the Miller gold mine, near Globe, from J. Miller & Co., who have worked it for several years, reducing the ore in an arrastra.

GRAHAM COUNTY.

E. Kielberg of Tucson has sold his Sixteen to One silver mine to E. S. Barnum and associates of Chicago, Ill. The mine is located in the Galiuro mountains. It is a large ledge with rich seams of silver and copper ore. There is a large body of ore which, it is claimed, gives from fifty to eighty ounces of silver to the ton and 8% copper.

The Gold Mountain M. Co., in Rattlesnake canyon, Galiuro mountains, in which Fleming Bros. of Tucson are owners, has a tunnel in 150 feet. About 100 feet from the mouth the ore taken out is free milling and runs from $6.50 to $15 per ton.

MARICOPA COUNTY.

Of the fifteen claims in the Mountain Chief group, near Harqua Hala, owned by Sparks & Devine, the North Star, War Horse and Blue Bird are the ones on which most of the work is being done. All the ore taken out is packed 3 miles on burros to the mill and from 80 to 100 tons of ore, averaging between $10 and $11 per month, have been worked monthly. The tailings can not be cyanided, and the concentrator has saved about ten tons of concentrates a month, averaging about $80 per ton.

MOHAVE COUNTY.

The Gold Road mine, near Kingman, is opened down to 200 feet and in a crosscut shows 30 feet of ore carrying large gold values. Supt. Mellarky is using machine drills both in drifting and in surface work.

H. A. Cohn of Salt Lake City, Utah, has bonded the Tom Reed and Ben Harrison mines in the Gold Road country, near Kingman, from J. Anderson, E. Hilty and D. Tooker. A shaft is to be sunk to a considerable depth at once.

S. C. Bagg of Kingman, manager of the Catherine mine of the New Comstock M. Co., reports that ore is being taken from the mine to the Arizona & New England Con. M. Co.'s mill for reduction. The cost of extracting and hauling to mill, he states, is about $1 per ton, and several hundred tons are to be treated to test values before the company puts up its own mill, which is projected of 100 tons daily capacity.

O. D. M. Gaddis and W. A. Mensch have interested George Kislingbury of Los Angeles in the American Flag mine, Wallapai mountain, near Kingman. Work has been started and the mine will be cleaned out and put in shape for examination and development.

YAVAPAI COUNTY.

The Brown Dick G. Co., operating near Prescott, is owned largely by G. B. Russell of New York and J. B. Tomlinson of Prescott. The company owns thirteen claims and has made extensive development work and erected a 20-stamp mill.

CALIFORNIA.

AMADOR COUNTY.

At the Shenandoah mine, near Plymouth, Supt. S. K. Thornton, after sinking one shaft to a depth of 500 feet, a drift was run 1000 feet south and a raise made to the surface. Here a hoisting plant has been erected with capacity for sinking 1500 feet, air compressors installed, and the upraise is being used as the start of a 1000-foot shaft.

CALAVERAS COUNTY.

A large body of pay ore has been discovered in the Angels mine, at Angels Camp, owned by J. V. Coleman. The vein is said to be over 30 feet in width and rich.

W. C. Russell, representing San Francisco people, is preparing to start a dredging scheme on the Calaveras river below Jenny Lind. He secured 180 acres of the Myers and Thompson ranches and is installing a drilling plant for prospecting.

The Sultana M. Co. of San Andreas has been incorporated to carry on a general mining business and smelting or reduction of ores. E. A. Godding, J. G. Quigley and G. W. Kimball of San Andreas are the incorporators, and Wilmington, Dela., the principal office.

EL DORADO COUNTY.

The Lucania M. Co. of San Francisco is about to develop a mine in an old river channel near Fyffe. Ground sluicing is being done and ditches are being made. C. J. Davis is Supt.

At the Noonday copper mine, near El Dorado, prospecting work is being done. One shaft is down 50 feet, with a good-sized ledge of low-grade ore in the bottom. Work in it is temporarily suspended by Mr. Wilkinson, the Supt., pending installation of machinery for permanent working. In the south shaft, 25 feet down, a drift shows a 7-foot ledge.

The School Girl mine at El Dorado is being worked by W. Felton, J. Vose, A. Hanley and J. Snider under a lease. The 10-stamp mill is being run steadily.

The Union mine, near El Dorado, has had a large hoisting plant installed on the old shaft. It is nearly ready to begin operation. Four developed pay shoots are to be worked. A. Harpending is general manager.

INYO COUNTY.

S. H. Huselton of Parkersburg, W. Va., has bonded from C. Peterson and J. McCarty a group of claims at Fish Springs. A large body of low-grade ore is to be prospected and the 5-stamp mill refitted and operated.

KERN COUNTY.

The December run of the Yellow Aster mills—one 30 and the other 100 stamps—lost but six hours and thirty minutes during the entire month. This involves the running of the five plants, the two mills and the three pumping plants. The entire expenditure during the year 1901 for the new 100-stamp mill, pumping plant and pipe line from Goler, repairs to old mill, etc., was $172,292; new development work in mine, $51,089; a total of $221,381.

MARIPOSA COUNTY.

J. B. Fontaine and M. Hart have leased the old Watson mine, near Mariposa creek, and will reopen it. The vein is about 2 feet wide, being greenstone and porphyry. The mine, it is stated, was last worked in 1854.

MONO COUNTY.

The lower tunnel of the Crystal Lake mine at Lundy will be 2700 feet long, and of this 1300 is now completed. The ground now being worked is being cut at from 43 to 45 feet per week. The tunnel is to open the ledges of the Crystal Lake mine at a depth of 2500 feet. In its course the tunnel must pass through claims owned by others at a depth from the surface of 1000 feet. The mine is already developed by workings as deep as 1200 feet from the apex.

NEVADA OOUNTY.

The Buckeye mine in Willow valley, near Nevada City, has been incorporated in New Jersey by T. B. Gray, J. T. Morgan and G. C. Shaw of Nevada City, J. H. Allen of Newark, N. J., and W. I. Sweet of New York City. T. B. Gray is president and J. T. Morgan secretary.

Work out at the old Electric, now the Grass Valley Con., at Grass Valley, is being inspected by G. W. Root of San Francisco, president of the company. An entire new plant has been put in at the mine under direction of Supt. O. Coffin, and preparation made for a thorough exploration.

J. W. Johnson of Nevada City is running a tunnel in the West Point mine near that place.

S. J. J. Sloat of Hamilton, Ohio, has bought the Mountaineer M. & M. Co.'s mine on Deer creek, at Nevada City, and has given instructions to Supt. W. Dennis to prepare to start up the mine in March. The tract of land adjoiuing the Mountaineer has also been bought.

At the Union Blue Gravel (De Noon) mine, above North Bloomfield, over 1000 feet of the 5000-foot tunnel has been run, work being prosecuted from the mouth of the tunnel and both ways from the bottom of the shaft, which is some 2000 feet from the mouth of the tunnel. Thirty men are employed.

C. Rosenthal of the Pine Hill copper mine, near Wolf, states that during the winter months development work will be done in the mine. Fifteen men are now employed. It is the intention to put in a new compressor capable of working twelve to fifteen drills, using either electric or water power machinery.

The Chicago mine at Gold Flat, near Nevada City, owned by W. Campbell of Grass Valley and W. F. Englebright of Nevada City, has been bonded to a number of miners from Grass Valley, who intend to erect hoisting works and sink a shaft.

PLACER COUNTY.

During the past season considerable development work has been done at the Daniel Webster quartz mine, near Michigan Bluff. The shaft has reached a depth of 125 feet and a number of drifts and crosscuts have been made.

T. M. Bowne, W. Rea, Jr., & Co. have everything in readiness to hydraulic at the Paragon mine, at Bath.

PLUMAS COUNTY.

The Concordia Group G. M. Co. has been incorporated at Reno, Nev., with $1,000,000 capital. The directors are G. W. Ingalls, J. S. Correcco, T. F. Dunaway, F. B. Julien, J. Sunderland and A. A. Hibbard, all of Reno, Nev., and C. G. Ebert of Redding.

SAN DIEGO COUNTY.

The stockholders' meeting of the American Girl G. M. Co. of Yuma, Ariz., elected G. D. Patten of Pasadena president and G. H. Coffin of Pasadena secretary and general manager. At the mine in the Cargo Muchacho district, near Ogilby, about $40,000 worth of new machinery has been added, making a crushing capacity of 100 tons daily. The plant consists of three sets of crushing rollers and a 100-ton cyanide plant. The average content of ore milled is $8.60. By using concentrators $5 is thus saved directly, and of the remainder $2.80 is then obtained from the tailings by cyanide treatment, leaving about 80 cents in the tailings. Fifty men are employed. T. Johnson is Supt. and W. R. Schilling foreman.

SHASTA COUNTY.

It is expected that the new plant of the Mount Shasta G. M. Co. at the Mount Shasta mine, near Shasta, will be in operation by April 1. The plant has a capacity of fifty tons per day, with motive power installation for fifty tons additional. The plant includes a large steam hoist and a complete concentrating equipment. A. S. Gibbs is Supt. The Mount Shasta Co. has ten miners, under Foreman W. F. Russell, developing the McClure group of copper mines near Bully Hill. It also has five men, under Foreman C. T. Graves, developing the Graves groups of copper claims in the Backbone district near Kennet.

It is reported that the Wynne claim on Clear creek, at Horsetown, had been sold to a company for dredging purposes.

SISKIYOU COUNTY.

J. Garvey, foreman in the Blue Gravel mine at Yreka, has started to reopen the mine at the old shaft. While getting out gravel from the old shaft, a new one will be sunk lower down the channel. The mine is being operated by a Cripple Creek, Colo., company, represented by J. C. Whipp of Yreka. This company proposes to obtain additional ground extending northward to the Yreka town limit. It is also reported that the Greenhorn No. 2 mine is to be opened in the near future with better pumps and a more powerful steam plant.

TUOLUMNE COUNTY.

Ten stamps of the Crystalline mill, near Jamestown, are being operated steadily on fair grade ore. The new gallows frame and hoist have been completed. A larger air compressor is being installed.

The improvements at the Harvard mine, near Sonora, are being completed rapidly. The gallows frame over No. 1 shaft has been raised and the concrete foundation for the hoist and engine is ready.

The Mustang mine, near Confidence, has been bonded to the Mustang M. Co., who have commenced development work by contracting to have the main tunnel pushed ahead 300 feet and an upraise then made to the surface. J. P. Oliver is Supt.

At the Hazel Dell mine, near Sonora, tests are being made preparatory to putting a reduction plant in at the mine. The mine has a large body of sulphide ore.

Three quartz claims, recently discovered near Yankee Hill by G. Mapes and N. Judson, have been bonded to H. C. Kennedy of San Francisco.

The shaft in the Golden West mine, at Sonora, is 60 feet below the tunnel level, and a heavy inflow of water has stopped sinking until pumping machinery is installed.

The shaft on the Lost Fox mine, near Sonora, is down 200 feet and shows an 8-foot ledge of gold-bearing ore. A sawmill has been built to cut the timbers for a 20-stamp mill to be erected.

COLORADO.

CHAFFEE COUNTY.

The first furnace of the reconstructed smelter at Buena Vista will blow in March 1, and the other furnaces will be pushed to completion as rapidly as possible. When all are in operation 600 tons a day can be handled.

CLEAR CREEK COUNTY.

The Gem Extension mine, near Idaho Springs, W. E. Renshaw manager, has opened into 4 feet of solid smelting ore in the vein near the Newhouse tunnel at a depth of 2000 feet below the apex. It will run, it is claimed, from 50% to 80% galena.

Manager Linn of the American Gold Standard Co., operating near Idaho Springs, has tested Black Eagle ore by the cyanide process with good results. The mill has a capacity of twenty-five tons a day and in a four weeks' run has made a saving of 80% of the values on the lowest grades. The value of the ore is about equal in gold and silver.

The Detroit M. & R. Co. has been incorporated at Idaho Springs, capital $75,000, and is preparing to build a mill of 100 tons capacity at that place. T. B. Crow is vice-president and manager.

The Woodbury M. & M. Co., organized to work the Abeel group, near Empire, as the result of a few months' work have an adit driven on the Abeel lode extended and three veins intersected. An 80-foot drift on the Bimetallic lode carries ore that will run about $12 per ton, with a streak of solid ore that assays as high as $95 in gold and silver. Arrangements for power drilling are being made, and the erection of a mill is contemplated.

The new compressor has been placed at the Newhouse tunnel at Idaho Springs and the company will now be able to supply the various mines working through it with sufficient air. The heading is now being driven at the rate of 9 feet per day.

GILPIN COUNTY.

Manager H. I. Seeman of the Yankee Con. mine at Yankee is opening several veins at an increased depth. He says that a new plant of machinery for the tunnel is to be bought immediately, after which it will be driven with machine drills.

J. Gilmour, Supt. of the Stewart mine, near Central City, says returns from a 25½-cord lot of mill dirt on the plates yielded 89.67 ounces, in value $1,466.35, and made twenty-two tons of tailings which sold for $401.09, a total of $1,867.44.

JEFFERSON COUNTY.

C. R. Critchell has had tests made on ores from his claims 18 miles west of Littleton, which show good values in bismuth, silver and tin.

OURAY COUNTY.

C. E. Blake has sold the Last Chance and Forest Queen mines, near Ouray, to A. E. Cox of Huntington, W. Va., who propose to organize a close corporation to work them in connection with the Great Western and Sun Down mines adjoining. The new owner, it is reported, has bought $10,000 worth of mining machinery and will drive a 1000-foot tunnel.

RIO GRANDE COUNTY.

At Liberty several companies are now developing properties in the Sangre de Cristo range. In this district, which is known as Music pass, a new town has recently been started called Chapin. The Blanca Mutual M. & M. Co. at this place are now erecting a mill to treat the ore from one of their mines, and it is claimed that this district is soon to have another mill.

SAN JUAN COUNTY.

The Red and Bonita mill, near Gladstone, has been running steadily, being operated by the Great Mogul people on ore from that mine. About seventy tons are treated daily. A force of seventy-four men is employed—fifty-seven at the mine and seventeen at the mill. In the spring the company expects to erect a tram line.

The Silver Ledge Co. is receiving bids on the machinery and contract work for erecting a 100-ton mill in the spring. The mill will be located at Chattanooga and a tram built to connect with the mine.

SAN MIGUEL COUNTY.

Contracts have been let for the construction of the new mill of the Tom Boy G. M. Co., at Telluride, and active operations will begin immediately. This mill will contain sixty stamps. In addition to the mill, contracts have been let for the building of a large tunnel house, timber shed and blacksmith shop at the mouth of the Argentine tunnel, and a large combination bunk and boarding house, which will contain the mine offices and have bath rooms, electric lights and steam heat.

The Gold Metal M. & M. Co. has been incorporated, capital $750,000, with E. E. Payson president, P. M. Fennis secretary, W. H. Brehmer general manager, and F. M. Hill Supt., to work eleven claims near Telluride, and formerly owned by J. Johnstone & Co.

SUMMIT COUNTY.

(Special Correspondence).—The Puzzle M. & R. Co., J. F. Callbreath manager, has a lease and option on the Puzzle mine at Breckenridge; also on Puzzle extension

claim. The former is developed through a 1500-foot tunnel on the vein, which has been stoped out above tunnel level. A winze is being sunk from the tunnel and the lattor driven ahead into Puzzle extension ground. The ores comprise an iron-lead sulphide, with gold, silver and lead values. A 50-ton concentrating mill is being equipped to concentrate the low-grade ores.

Brockenridge, Feb. 5.

TELLER COUNTY.

President Burns' eighth annual report for the Portland G. M. Co. says the corporation now owns thirty-six mining claims or fractions thereof, comprising a solid body of little more than 200 acres. The report of Mine Supt. Trevarthen says the total development of the mine to Jan. 1, 1902, was 20 miles 1240 feet. Total development during 1901, 3 miles 2691½ feet. The production for 1901: Net tons, 76,905,550; ounces gold, 120,339.473; ounces silver. 2,909.977; gross value, $2,408,413.23; treatment charges, $625,999.67; freight charges, $21,474.31; net proceeds, $1,760,-939.25. Mine Engineer Kurio says that during the year 147,912,898 gallons of water were pumped from the mine.

The Star G. M. Co., which has been developing the Home Fraction, near Cripple Creek, has opened up a shoot on the 300-foot level that it is claimed runs $85 in gold to the ton from a 3-foot breast. J. F. Erisman is manager.

Mr. Cone of Canyon City is doing work on his Ophir claim at Cripple Creek. A three-compartment shaft is being sunk to the 1000-foot level and a steam plant with a sinking capacity to 1500 feet is to be installed. Large ore bins are also under construction.

The El Paso Con. Co. at Cripple Creek is now working ninety men, of whom eighty-eight are working on development entirely, and only two men are breaking ore. One machine drill is breaking enough ore to pay all the operating expenses of the property, and is being worked in the tunnel level in an ore breast 40 feet in width.

D. D. Short and W. P. Wilhur have taken a lease on the tailings which have accumulated at the Economic mill, near Victor, together with the prospective accumulations of the next two years, and are to build a plant for their treatment.

W. S. Stratton, it is reported, contemplates erecting in the near future a 600-ton cyanide mill to treat ore from his low-grade deposits.

The system adopted by the Moon-Anchor Co. at Cripple Creek, in leasing, is considered satisfactory both by the lessees and the company. This system, which was put in operation some time ago, is that the company furnishes everything, including powder, drills, candles and the hoisting of the ore, and receives 50% of the receipts from the sale of the ore.

IDAHO.

The Mount Pisgah M. & M. Co. has been incorporated in Salt Lake City, Utah, capital $45,000, with J. Sindar as president and M. Thomas secretary. The company owns the Overland Nos. 1, 2, 3, 4, 5 and 6, Old Crow and Little Joint claims in the Mount Pisgah district.

IDAHO COUNTY.

W. Moore and C. Camphell of Walla Walla, Wash., have given an option on three claims in Thunder mountain to H. T. Hendricks of Baker City, Or., at $150,000.

It is stated that the Rocky Mountain Bell Telephone Co. has bought the material for a telephone line to Thunder mountain, the work of construction to begin as soon as the weather will permit. It is thought the work can he completed within three months. The line will be run from Boise, via Idaho City, and will be about 150 miles long.

KOOTENAI COUNTY.

A quartz and placer strike has been made on Renfro creek, about 6 miles from Tyson camp, across the St. Maries river. Mr. Griffiths of Tyson says the first ledge was discovered in January. The ledge is said to be 3 feet wide, with free-milling gold ore. He says that the placer prospect is very fine, as high as $1 to the pan having been taken out.

LATAH COUNTY.

The Jerico quartz mill, near Elk Creek falls, 55 miles east of Troy, is a 3-stamp plant, twenty-five tons per day capacity. The mill is being taken in from Troy over the snow. The mortars weigh 7000 pounds each and the grizzly 4200 pounds. The shaft on the Jerico mine is down 125 feet and has developed ore assaying $35 per ton. The company has put in a 12 H. P. gasoline hoist, a 4 H. P. gasoline engine to run the concentrator and will install a 16 H. P. gasoline engine for the mill.

OWYHEE COUNTY.

The electric machinery for the Poorman mine, at Silver City, has been installed and the pump started to unwater the deep shaft. The power comes from the Swan Falls electric power plant on Snake river. Three large mines, the Dewey tunnel and two big mills are operating their machinery and are lighted, and Dewey City and Silver City lighted, by this power.

MONTANA.

The January, 1902, receipts of gold at the Helena assay office amounted to $190,760, against $159,425 in January, 1901—the largest receipts for that month in the history of the office. The gold was practically all from stamp or cyanide mills.

FERGUS COUNTY.

The New Year G. M. Co. is again on a paying basis, and, pending completion of the new plant, the old mill is run to its full capacity—fifty-five tons per day. With the starting up of the cable tramway twenty-five men were put to work. The tramway is conveying seventeen tons per hour, which can be increased to twenty-five tons. With the entire new plant in operation about 250 tons of ore will be treated daily. The new cyanide mill will contain five tanks with a total capacity of 540 tons, two of them holding 150 tons apiece. The ore found in the New Year claims is well adapted for treatment by the cyanide process and can be handled, it is claimed, at a cost of 40 cents per ton.

The Kendall G. M. Co. has bought the Agnes and Gulch mining claims at Kendall from C. Allen. The properties are prospects with surface showings which it is thought on development will prove them to be a valuable addition to the Kendall mines.

LEWIS AND CLARKE COUNTY.

The Winscott mine at Helena has been sold to the Big Indian M. Co., A. C. Mason of Tacoma, Wash., president and manager. A contract for a 60-stamp mill of 300 tons daily capacity has been let, and it is expected to have it completed by July. The stamps are to weigh 900 pounds each. The mill will be operated by electricity from the Missouri River Power Co. from Canyon Ferry, a contract for 150 H. P. having been let, and the mining company will build a pole line 4½ miles long to conduct the power to the mine. The mine is a mountain-like deposit of low-grade ore, free milling so far as it has been developed. The development consists of a quarry opening about 300x140 feet on the surface.

MADISON COUNTY.

The Old Joe mine, at Pony, owned hy J. Nelson and F. P. Reinoehls, has been bonded by Butte people for ninety days at $30,000. Seven men have been put to work on the property. The mine is considered a big low-grade proposition. It has produced considerable shipping ore while being developed.

SILVER BOW COUNTY.

The vein opened hy Farrell shaft No. 3 contains a 6-inch streak of exceedingly rich ore. It is claimed that it assays 1000 ounces in silver and 50% copper. Outside of the rich streak there is a large body of ore that assays about 30% copper and some silver.

NEVADA.

Through the sale of the Nevada railroad hy A. P. Stokes to the Nevada Midland Railroad Co., incorporated in New Jersey with a capital of $1,750,000, a railroad scheme to reach Tonopah has been started. The Nevada Central railroad, which runs from Battle Mountain, Nev., on the line of the Southern Pacific, to Austin, will he extended south 112 miles to Tonopah. S. Bamherger, of Salt Lake City, Utah, is president of the company.

ESMERALDA COUNTY.

F. G. Humphrey has discovered what is supposed to be a valuahle turquoise mine, near Crow Springs, on the road to Tonopah.

EUREKA COUNTY.

The Excelsior M. Co.'s statement of the business transacted by it in Nevada during the year 1901 shows: Received from sale of ores, $57,123.60; dishursed for lahor, supplies, freight and expenses, $46,429.66; net gain, $10,693.94.

NYE COUNTY.

D. Fitzpatrick has bonded the Maggie May claim and commenced sinking a shaft to go down 60 feet before crosscutting.

Last December E. Clark started out to prospect the country north of Tonopah and made a new discovery situated about 12 miles northeast of Tonopah. The ledge, or lode, can be distinctly traced for 5000 feet, being covered in places with only a wash deposit of a few inches, and pay float is found in the gulches and on the hillsides. Along the ledge the croppings are shipping ore. On the Horn Silver claim on this ledge, owned by L. O. Ray, out of the twenty-two assays taken along the croppings of his claim the lowest return was $50 in gold and silver and the highest was $366.70. The ore carries from 15% to 60% lead in the carbonate. A shaft down 12 feet showed the ledge 3 feet wide, with ore assaying $266 silver and $23 gold per ton. Many working leases have been taken by Tonopah people.

WHITE PINE COUNTY.

The Rocco-Homestake Nevada M. Co.'s statement of business transacted by it during the year 1901 shows: Received from ore sales and other sources, $70,-185.96; paid for expenses, labor, hauling, freights, etc., $58,314.05; net gain, $11,-871.91.

NEW MEXICO.

GRANT COUNTY.

The Michigan-New Mexico Copper Co. is working on its claims in the Little Burro mountains. On the Copper Dyke mine the shaft, down 40 feet, is following a 3-foot vein of shipping ore. Assays give average values of 11% copper and $5.50 gold and silver per ton. The shaft will be sunk to a depth of 150 feet. The same company is working the Iron Dyke, in which, under the iron cap, hematite was encountered which assays 65% iron.

G. H. Utter is developing the Cleveland Copper group at Pinos Altos and has opened up several veins of ore.

TAOS COUNTY.

The Wayne Arriba M. Co. has been incorporated, capital $1,250,000, with G. A. Kirker president and S. Clarke secretary and treasurer, both of Detroit, Mich., to develop mining property in the Bromide district, about 14 miles from Tres Piedras, where it has four claims, two of which are now under development.

OREGON.

BAKER COUNTY.

The cyanide plant of the Perry and Rachael property, near Baker City, operated by the Aurora G. M. Co., has been completed. The company has ordered a new pump for deeper sinking.

The Richmond group of mines at Bonanza, near Baker City, is to be reopened by E. D. LeClare, the owner.

The Empire mine, near Baker City, has been leased to the Phœnix G. M. Co., which has made arrangements to do a lot of development work at once. There is a 10-stamp quartz mill belonging to this mine which will be run.

GRANT COUNTY.

W. Wade, manager of the Scandia M. & T. Co. of Spokane, Wash., operating on Quebec hill, near Granite, reports that the tunnel has cut through several small veins of gold-hearing ore. The tunnel is now in 1300 feet of the 3000 feet total length estimated before the work is finished. It is 7x7 feet and is fitted for two tracks. The first big vein will he tapped at a depth of 900 feet—the tunnel will reach in about 400 feet—the second ledge will be struck at a depth of 1000 feet and the third at a depth of 1200 feet.

J. H. Warner has sold a half interest in the Black Hawk mine, in Greenhorn district, near Granite, to a Pittsburg, Pa., capitalist for $75,000. The mill is under construction. A 100-light dynamo will also be installed.

JACKSON COUNTY.

At the Bowden mine, near Gold Hill, ore that averages $100 per ton has been uncovered at a depth of 200 feet in a 3-foot ledge. It is owned hy Houck & Haff.

JOSEPHINE COUNTY.

Riggs & Flamm have made a rich gold quartz discovery in the Grave Creek district, uncovering a large ledge, from which tests made show it to carry from $32 to $90 per ton, mostly free gold.

W. Bailey, M. E., manager of the English-Canadian Co., which owns the dredger "Josephine" near Waldo, is arranging to resume operations with it.

A new cyanide plant has been installed at the Gold Bug mine, in the Mount Reuben district, to work tailings which run $15 per ton. A new two-cage hoist and additional stamps are also to he installed at the Gold Bug. Development in this mine is proceeding by five levels, the longest being 750 feet, and a depth of 350 feet being reached. The ore body is found in a vein possessing a width of 16 feet and carrying an average value of $30 per ton. The monthly clean-ups are said to run from $12,000 to $15,000. A 5-stamp mill and thirty men are employed. The Gold Bug is the property of S. P. Jones of Nevada, S. L. Jones and H. M. Gorham.

What has long supposed to have been lead, or some other comparatively worthless metal, and which has been found in quantity in the Myrtle creek placers, near Grants Pass, and thrown away hy the miners, is now found to be native silver, so a report from the locality states.

UMATILLA COUNTY.

Twenty-five placer claims have been made on the north fork of the John Day river. It is only recently that this part of the John Day river has become known as a placer mining country.

SOUTH DAKOTA.

The National Smelting Co. of Boston is building a 500-ton smelter at Rapid City that is expected to be in commission in April. The building is of steel frame with corrugated iron sheathing, and is 150x200 feet. It is built in two floors, the ground floor having the boilers, engines, blowers, furnaces, refinery and dynamo for electric lighting. The second floor is divided into a feed room where the furnaces are charged, and the sampling works. The smelter has two furnaces, one for lead, 36x120 inches in the clear, and one for matte, 36x144 inches, both water jacketed 20 feet. There is room for four additional furnaces when desired. H. H. Muggley of Boston, Mass., is general manager at Rapid City.

UTAH.

JUAB COUNTY.

The Buckeye M. Co. at Diamond, in Tintic district, has been reorganized and systematic development is to be started.

SALT LAKE COUNTY.

The Dalton G. M. Co. of Salt Lake City has elected B. A. McMillan, J. H. Lakin, C. M. Garrison, A. H. Adkinson, T. B. Beatty, C. H. Dowse and O. R. Young directors. The report of O. R. Young, manager, states that during 1901 1050 feet of work was done in the mine at Bingham and considerable $6 to $20 ore exposed in the different workings. Surveys have recently been made for a tramway from the mine to the mill, a distance of 7000 feet, and he recommends that one be put in.

TOOELE COUNTY.

It is reported that the Con. Mercur M. Co. will complete the Electric tunnel by extending it through to connect with the Lulu territory. At present the transportation and mining of the ores cost about $1 per ton, the ores that are extracted from the southern portions of the company's ground going to the mill by rail. This expense will have been entirely overcome with the proposed extension of the tunnel.

WASHINGTON.

FERRY COUNTY.

Connection has been made between the lower and upper workings of the Lone Pine mine, at Republic, owned by the Lone Pine-Surprise M. Co. The raise is 70 feet in height in the ledge, where it is from 12 to 15 feet wide. The ore is claimed to have an average value of $19 per ton. Supt. P. Creasor says that he can take out 100 tons daily for several months. He says the company will make the continuation of No. 2 tunnel for 200 feet, and make the installation of a large compressor and hoisting plant on a large working shaft to be sunk 600 feet. The compressor plant will be of 10-drill capacity, and, when installed, it will furnish the necessary air to operate two small hoists, one on the Surprise and one on the Pearl claim.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—J. Caplice of Butte, Mont., who owns a number of copper properties near Atlin lake, says the winter prospecting is making a good development and that in a tunnel cut there is 70 feet width of solid ore, running from 6% to 24% copper. The Lakeview gold quartz properties near Atlin, under bond to R. D. Fetherstonhaugh, have been sold to a Philadelphia company. There is a high-grade free-milling quartz strike reported from Boulder creek, where the placer miners have been drifting this winter. J. M. Ruffner is developing quartz properties on Pine creek, opposite the original placer discovery. The new map of the Atlin district is well under way and will be ready for publication about April 1.

Atlin, Jan. 25.

A body of high-grade ore 3 feet wide has been discovered in making a raise from the fourth level of the Fern mine. The ore shows in the floor of the level 160 feet above on the vein, so that the extent of the shoot is large. The Fern has been under lease to A. J. Nichol of Nelson.

R. Findlay of Atlin says that a company of Atlin mine owners, associated with W. A. Clark of Butte, Mont., will build a smelter at Atlin this year. Work will be started early in the spring and the site is now being surveyed at the Atlin lake end of the Taku Arm-Atlin portage, which is centrally located.

J. N. Greensides, K. C., of Montreal, a director of the Montreal-Boston Copper Co., which owns the Sunset mine in Deadwood, is negotiating to buy the pyritic smelter at Boundary Falls. The Sunset property is now opened so as to ship 400 tons of ore daily.

The preliminary operations for the erection of the Osborne Bay copper smelter for the Mount Sicker copper mines have been started and the actual

work of construction is to he soon hegun. The contracts for the grading of the site for three 200 H. P. hoilers and for the masonry, timber and wharf have heen let. The plans and specifications for the wharf call for a structure 750 feet long, equipped with double tracks for narrow and standard gauge cars and a ferry slip with three tracks, so that three cars may be landed from the ferry simultaneously. The intention is that copper made at the smelter will he shipped to New York direct. There will also he an ocean dock to receive ores from Alaska.

The extensive improvements at the Canadian smelting works at Trail have been completed. The new automatic crusher and sampler, having a capacity of 150 tons per hour, has been tested satisfactorily. A system of electric tramways has been installed to connect the roast heaps with the main works. The lead stacks have heen hlown in. The starting of the copper furnaces waits on shipments from the Center Star and War Eagle mines at Rossland. The plans for a refinery to treat silver-lead matte are finished and construction is to be commenced immediately.

The Velvet mine at Rossland has made a contract with the Hall smelter at Nelson for the treatment of its ore and will ship a car daily, commencing at once. According to the manager's report, this is $20 ore from below the 400-foot level in the mine.

A company has heen formed in London to reopen the Hardie mountain cinnabar mine, near Savonas. J. Luce is Supt. Later it is intended to erect furnaces for the treatment of the ore.

The Cinnabar M. Co., Ltd., has decided to reorganize and increase the capital stock from $100,000 to $500,000. This company has twelve claims near Kamloops and several years ago erected a furnace with a capacity of thirty tons a day.

The Mines Exchange, Limited, of Nelson, B. C., says:

The Iowa M. Co., on Tracey creek, East Kootenay, have let a contract for the driving of 100 feet of tunnel. The ore in the Iowa is galena and carries some copper and gold. The pay streak is 2 feet wide of clean ore in a ledge 6 feet wide.

The Arlington Co., in the Slocan, has hought the Amos and Amos Fraction from R. Bradshaw and James Orr. The claims adjoin the Arlington.

The ore shoot in the Silversmith mine at Slocan has widened out to 4½ feet of solid high grade steel galena. Assays as high as 1500 ounces to the ton have been had, while the whole vein will run several hundred ounces. The Silversmith belongs to the Byron N. White Co.

Shipments from the Granby mines at Boundary now amount to a minimum of 1000 tons of ore every day, two trains of seventeen cars each being required to handle the output. It is expected that in a short time the shipments will further increase to 1500 tons per day, when the two new furnaces of the smelter are blown in.

The Arlington mine of the Hastings Exploration Syndicate, at Erie, has 100 men at work, and for the past ten days has been shipping at a rate of two cars per day, one-third of which is concentrates, the halance heing crude ore.

The tramway at the Silver Hill, Crawford Bay, has been completed and is in successful operation. It is 2 miles long, being of the douhle rope system, the buckets carrying 1000 pounds each, and the tramway having a capacity to deliver 200 tons per day. The lower terminal is at a point 9 miles from Kootenay lake, to which the ore is hauled hy wagon.

The returns from the Le Roi No. 2 for the month of Decemher are given as follows: Ore shipped, 5025 ton; contents, 2215 ounces of gold; 7650 ounces of silver; 122 tons of copper; gross value, $89,000. To be deducted—Smelter charges, $41,500; cost of mining, $15,000; ore tax for quarter, $2900. Total deduction, $59,400. Estimated net profit, $29,600.

KLONDIKE.

A stampede is reported from Dawson to Gladstone creek, a trihutary of Indian river, where the discoveries of gold-hearing conglomerates are reported. The Gladstone creek strike is of placer gold. This same ground was staked in 1898, when all the creeks were overrun, hut the claims were allowed to lapse without heing fully prospected.

MEXICO.

B. T. Scott, general manager of the Venice C. M. Co., has arranged to install machinery at the mines at Soyopa, Sonora. A 42-inch water jacket smelter will he erected. The company has claims aggregating 120 pertenencias. Upon one they have ahout 1200 feet of tunnel and crosscutting, exposing sulphides and oxides of copper.

E. B. Wiggins of the Alamo, Lower California, mining reglon, has brought to San Diego two gold bricks, the product of the cyanided tailings taken from the Aurora, Evelyn and Princess mines. Wiggins has heen in partnership with J. H. Packard for two years, and during that time they have made $20,000 net hy operating the cyanide plant. The plant will later be moved to Barstow, Cal.

At Suaqui Grande, Sonora, the Chicago & Sonora Placer M. Co. are preparing for operations on a considerable scale. Ahout 100 tons of machinery are on the ground and en route.

W. S. Morrow, manager of the Grand Zodiac M. Co. at Suaqui Grande, Sonora, says the company has at the mine a 5-stamp mill, Wilfley concentrating table, and a 60 H. P. engine and boiler, which will be set up and put into operation at once. With the power other hatteries of stamps and concentrators will be added as needed.

TRANSVAAL.

The annual report of the Randfontein Estates G. M. Co., dated December 23d last, states that no damage had been done to any of the mines of the company during the war. On the surface very trifling injury was done, hut everything connected with the mines and the surface work has been put into good order again. It was decided just about the time when the war started to increase the stamping power of all the mines from 60 to 100 stamps each. The Porges, South, North, Rohinson, Block "A" and Mynpacht Randfontein mines will within a very short time have each of them, 100 stamps working instead of 60. All the stamp machinery has heen made during the war and forwarded to South Africa.

Personal.

J. F. SMITH is Supt. Phœnix mine, Liscum, Ariz.

H. A. COHEN of Salt Lake City, Utah, is at Kennet, Cal.

R. BROWN is Supt. Emancipation mine, at Wall Street, Colo.

E. AUSTIN is Supt. of the Fenochia mine, near Fronteras, Ariz.

W. F. STAUNTON will act as manager Tombstone M. Co., Bishee, Ariz.

W. A. FARISH of Denver, Colo., recently made a trip to New York City.

J. LEATHAM of Nevada City, Cal., is Supt. of a mine at Casa Grande, Ariz.

L. KILLEEN is manager for the Belene Copper Co. at Copete, Sonora, Mexico.

J. P. EVANS, auditor Colorado Iron Works, Denver, Colo., is in Los Angeles, Cal.

COL. FRANK MCLAUGHLIN of San Francisco and New York is in the former city.

A. J. CAMPBELL has been appointed Supt. Isabella G. M. Co., Cripple Creek, Colo.

J. A. CHURCH, formerly of Tomhstone, Ariz., is examining mines near Prescott, Ariz.

J. S. MCCULLOUGH has been appointed Supt. of the Dalton mines at Richfield, Utah.

G. SPAULDING AND W. M. STATLER of Yuma, Ariz , are in Lower California, Mexico.

W. A. DOBLE has returned to San Francisco from a business trip to Los Angeles, Cal.

M. W. MATHER has returned from San Francisco to the Plumhago mine, Nevada county, Cal.

JOSEPH DEBONS is Supt. Pat Goggins gravel mine, at Michigan Bluff, Placer county, Cal.

B. F. DIBBLE, manager Harvard M. Co., has returned from Jamestown, Cal., to Boston, Mass.

C. A. BURCHAM has been appointed Supt. of the Yellow Aster mines and mill at Randshurg, Cal.

LEWIS SEARING, manager of the Denver Engineering Works, was in Chicago, Ill., on the 8th inst.

U. G. CARPENTER, manager of the Pass Me By Tunnel Co. at Carpenter, Colo., is in New York.

J. P. OLLIVER has heen appointed Supt. of the Mustang mine at Confidence, Tuolumne county, Cal.

S. P. TRAYLOR is now the New York City representative of the Colorado Iron Works of Denver, Colo.

J. E. BAMBERGER, manager of the Daly-West mine at Park City, Utah, has returned from New York.

W. J. LORING, late of Calaveras county, Cal., left San Francisco for Kalgoorlie, Australia, on the 8th inst.

R. WHITE, Supt. of the Highland Boy smelter at Bingham Junction, Utah, was in Butte, Mont., on the 10th inst.

LEWIS T. WRIGHT, manager of the Mountain Mines, Ltd., at Redding, Cal., is in New York to meet Managing Director C. W. Fielding, who comes there from London.

C. W. HOWARD JR., manager of the Spenceville copper mine at Spenceville, Cal., is sojourning in San Francisco, Cal.

H. TURNER of Steamboat Rock, Iowa, is now with the Minas Prietas Reduction Syndicate at Minas Prietas, Sonora, Mexico.

J. N. WILLIAMS of Boulder, Colo., who has been examining mines in southern Oregon, ls now sojourning in Los Angeles, Cal.

R. D. GRANT, who has heen in British Columbia, examining a mining proposition, has returned to Salt Lake City, Utah.

S. D. NICHOLSON is to be manager of the A. Y. and Minnie mines at Leadville, Colo., under the new ownership of these properties.

J. LUCE, late manager Cactus M. Co., at Milford, Utah, has been appointed Supt. Hardie Mountain cinnahar mine, near Savonas, B. C.

V. V. CLARK, formerly manager of the Higueras G. M. Co. at Agua Caliente de Baca, Mexico, has opened a mining office at Alhuquerque, N. M.

G. H. GRUSS, formerly of Genesee, Plumas county, Cal., is now in charge of the mill of the Golden Horseshoe M. Co., at Kalgoorlie, West Australia.

F. C. SCHRADER of the U. S. Geological Survey will spend the summer in a reconnoissance geological survey of the Copper river country in Alaska.

C. CANTRELL, who was foreman at the Union mine, at El Dorado, Cal., for several years, has been appointed foreman at the Montezuma mine, Nashville, Cal.

M. M. O'SHAUGHNESSY has recently returned to San Francisco, Cal., from several months' sojourn in the Hawaiian Islands, where he has heen engaged on large water works construction.

ROBERT MCF. DOBLE of San Francisco, Cal., is in British Columbia, engaged in the examination of hydro-electric transmission projects for the city of Vancouver and vicinity.

WRIGHT H. AUBURY of Los Angeles, Cal., has taken the superintendency of the Pacific M. Co., a Minnesota company that will do considerable development work in the vicinity of White Hills, Mohave county, Ariz.

CHESTER W. BROWN, manager Inca M. Co., left San Francisco for Tirapata, Peru, on the 11th inst. With him went Jesse J. MacDonald as assistant general manager. Mr. MacDonald goes on a two years' contract at an annual salary of $6000 and expenses.

Commercial Paragraphs.

THE Scully Steel & Iron Co. have established an agency in Denver, Colo., with N. L. Wright as sales agent.

THE Dearhorn Drug & Chemical Co. of Chicago, Ill., have established a branch at Denver, Colo., with George E. Talcott as Western manager.

THE Weigele Pipe Works, Denver, Colo., are completing their new shop, which will he equipped with new and up-to-date appliances.

THE San Francisco, Cal., office of the Westinghouse Electric & Mfg. Co. is to he removed from the Mills Bldg. to corner First and Market Sts. about May 1, 1902.

G. E. ALEXANDER'S new assay and ore-testing plant in McPhee Bldg., Denver, Colo., includes facilities for cyanide work, concentration, amalgamation and slime settling.

THE Denver Engineering Works Co. have estahlished a city office at 604 and 605 McPhee Bldg., Denver, Colo., their works heing at Thirtieth and Blake streets in the same city.

THE Boston & Montana and Anaconda C. M. companies are stated to have installed at Great Falls, Divide and Anaconda, Mont., Stirling water tube safety hoilers aggregating 12,000 H. P. Further statement is made that "the new smelter on Washoe hill, Anaconda—the largest reduction works in the world—contains one plant of 4800 H. P. of Stirling hoilers."

THE Cataract Power & Conduit Co. of Niagara Falls has recently awarded to the Westinghouse Electric & Mfg. Co. a contract for seven 2500 H. P., oil-insulated, water-cooled transformers. These transformers will he wound for 2200 volts, two-phase, to 11,000 or 22,000 volts, three-phase, and will duplicate the present equipment in the transformer house at Niagara Falls.

THE Allis-Chalmers Co. received an order through their Salt Lake, Utah, office, H. V. Croll manager, for a 60-stamp mill, each stamp weighing 850 pounds, from Allen C. Mason of Helena, Mont. The mill will be built on the Winston property, 4 miles from Helena, and will be driven by three electric motors—two for the sixty stamps and one for the large Gates crusher. This mill will have several new features in its construction, among which is a special new design of conveyor for the ore bins, and heavy cast iron anvil blocks placed under the mortars, which rest upon a large concrete foundation, instead of the usual wooden mortar block. This construction, it is believed, will increase the crushing capacity of the stamps from 20% to 25%. It is expected the mill will he in operation hy June 1, 1902.

THE Pacific Coast Ore Sampling Works has completed its new huilding at Adam's wharf, Oakland, Cal. Up-to-date mechanical appliances for the speedy and economical handling of ores have been installed, and the plant is claimed to rank in efficiency with any in the country, the assaying department being especially perfect in equipment. Receipts of ore from several districts are already heing received and handled. The works are under the direct management of J. Bruce Gibson, the owner, who was formerly connected with the Puget Sound Reduction Co., of Everett, Wash.

BAKER & Co., gold, silver and platinum refiners, of Newark, N. J., and New York, say: "As a number of rumors have reached us that we have sold all or a portion of our business and that we have joined forces with other platinum interests, we take this means of advising our customers, friends and the trade in general that no change of any description has taken place in our concern, nor are we in any combination whatever, and that we continue to give all that favor us with their patronage our very best effort in filling all orders entrusted to us, with extreme care and accuracy, supplying the best quality at the lowest possible price."

THE Crocker-Wheeler Co. of Ampere, N. J., has just issued a new bulletin, No. 18, describing the electrical equipment of the Joseph Dixon Crucible Co. of Jersey City. This company, which formerly operated four steam plants, has now substituted for them one electric power plant. A 100 K. W. generator and 24 motors, all of Crocker-Wheeler manufacture, have been installed. During January the company shipped electrical machinery as follows: To the De Lamar Copper Ref. Co., Carteret, N. J., one 520 K. W., one 100 K. W., one 50 K. W. generators; Iron City Engr. Co., Uniontown, Pa., four 100 K. W. generators; Anglo-American Prov. Co., Chicago, Ill., seven motors, ranging from 10 to 75 H. P.; Pennsylvania Steel Casting Co., Chester, Pa., one 350 K. W. generator; Quintard Iron Works, New York City, one 65 K. W. generator; Marine Eng. & Mach. Co., Harrison, N. J., two 50 K. W. generators, one 60 H. P. and two 35 H. P. motors; U. S. Elec. Ltg. Co., Washington, D. C,, one 90 K. W. generator, one 130 H. P. motor; National Tube Co., Pittsburg, Pa., one 110 K. W. generator; Niles Tool Works, Hannihal, Ohio, a consignment of motors; Erie Rapid Transit Ry., Harbor Creek, Pa., one 200 K. W. generator; L. S. & M. S. Rwy. Shops, Collinwood, Ohio, one 400 K. W. generator, one 75 K. W. generator; Lehigh University, South Bethlehem, Pa., one 30 K. W. generator; American Car & Foundry Co., Madison, Ill., one 110 K. W. generator; Armour Fertilizer Works, Atlanta, Ga , one 150 K. W. generator, two 50 H. P. and one 90 H. P. motors; Park Steel Co., Pittsburg, Pa , one 200 K. W. generator; J. K. Farley Mfg. Co , Chicago, Ill., one 150 K. W. generator; Ft. Hill Chemical Co., Rumford Falls, Me., four 140 K. W. generators.

Catalogues Received.

The Allis-Chalmers Co. have issued Catalogue No. 24, seventh edition, on Riedler pumps. It is strictly up to date and an engineer's handhook on the subject, which is treated comprehensively and completely. The portions relating data of operation of these pumps with compressed air are specially interesting. The same company has also issued Catalogue No. 46, fifth edition, on Riedler compressors and blowing engines. Like the other catalogue referred to ahove, this one is technically all that an engineer could ask in the completeness of its information on the subject and the simplicity of its method of statement. Both catalogues are excellent examples of high-class printing and illustrating. These catalogues can he ohtained on request being made to the Allis-Chalmers Co., Chicago, Ill.

MINING AND SCIENTIFIC PRESS.

Whole No. 2170.—VOLUME LXXXIV. Number 8. SAN FRANCISCO, SATURDAY, FEBRUARY 22, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

San Francisco and Metallurgical Industries.

The tendency to the concentration and development of the metallurgical industries in the seaport cities of the Atlantic coast and the Great Lakes, as compared with the inland cities where they had their inception, is manifesting itself on the Pacific coast. During the last two or three years there has been a rapid growth of the number and magnitude of such establishments both on the shores of Puget sound and at San Francisco, Cal. The latter is particularly notable in that it has not been anticipated nor has it in any way discounted the future. In this respect the growth is comparable with the growth of the same metallurgical industries around New York. At first thought they would seem to belong where the mines are rather than at points so distant from them, but the cheapness and facilities for assembling raw materials and distributing finished commodities are so superior at the seaport cities, that the industrial movement can be considered the natural operation of an economic law.

San Francisco has so long been considered purely a commercial city that the idea that it can become by the force of its inherent advantages a great metallurgical center as well may seem surprising. The fact is, however, that San Francisco, to a remarkable and exceptional degree, possesses those determining advantages which will ultimately give to its metallurgical industries the supremacy the city now has in commerce.

Mack Con. Gold Mine, Big Oak Flat, Tuolumne County, Cal.—(See Page 104.)

Its position as an assembling point for the raw materials of a metallurgical industry leaves nothing to be desired. It is very much nearer to the mines than any of the Atlantic coast cities, and with the completion of an interoceanic canal it will be equally near to all of the consuming markets of commodities. The canal will restore natural lines of movement to the assembling of raw materials and the distribution of commodities manufactured from them. The one will go outward to the nearest seacoast assembling point, the other inland from the nearest coast port. San Francisco, on the Pacific coast, will, just as has New York on the Atlantic coast, become the principal point of assembling and distribution.

San Francisco bay and its extensions, San Pablo and Suisun bays, provide on their shore lines probably a greater linear extent of deep water sea frontage, and back door railroad facilities already created, than any seaport in the world. Much of the shore line of San Francisco bay proper south of San Francisco and Oakland is bounded by too wide reaches of shallow water to be immediately available for use. North of these cities on both shores, the entire south shore of San Pablo and Suisun bays and both shores of Carquinez straits, connecting the two last named bays, offer ideal sites for metallurgical plants. The aggregate of frontage is not far from 100 miles.

This continuous shore stretch from Oakland to about Antioch may all be regarded as immediately available. It is all bordered by a channel of deep water, nowhere requiring very long piers to reach it from the shore. Two lines of transcontinental railroad run along it, so that rail and ship are close together. The facilities for the cheap assembling of cheap fuel are already partially completed and their practicability proven. The petroleum-carrying pipe line from the San Joaquin valley will give this district the cheapest fuel supply of any great seaport city in the world. Nor, in considering the future, need the cheapness, determined by the cost of the pipe line transportation from the developed San Joaquin oil districts, be considered the limit. The writer considers reasonable the prediction that petroleum fields will ultimately be developed so near by the fuel-consuming industries on this shore line that the latter will be commercially supplied at charges not exceeding in equivalent fuel value a rate of $1 a ton for bituminous coal.

One electrical transmission line already traverses this stretch of shore line. The Bay Counties Power Co. have developed a small fraction of the possible water power of Yuba river, one of the Sierra Nevada mountain streams, and are commercially utilizing more than 10,000 kilowatts (electrical horse power) in the bay shore region under consideration. The distance of the farthest transmission, 214 miles, is a demonstration of practicability of electrical transmission of the water power of all the Sierra Nevada streams within the limit of that distance at least. It makes commercially available the water powers of three forks of the Feather river, the three forks of the American river, the Mokelumne, Stanislaus, Tuolumne and Merced rivers. While the last four named are already largely utilized locally, there is an aggregate surplus that, added to what can be developed and made available from the Feather, Yuba and American rivers, will make an aggregate of between 250,000 H. P. and 300,000 H. P. The cheapness with which this water power, electrically developed and transmitted, can be laid down on the switchboards of industrial establishments on this stretch of deep water seaport shore line will seem astounding to those not familiar with what has been accomplished in water power development and transmission in California. From the branches of the American river alone more than 50,000 kilowatts can be so delivered at less than four-tenths of a cent a kilowatt hour, or not more than $25 per twenty-four hour horse power per annum.

The importance of this large available supply of cheap electrical power is of equal importance with the even larger available supply of cheap petroleum fuel. Electro-metallurgical industries are continually being developed and the general industrial tendency is to the substitution of electricity in place of fuel wherever practicable and economical. A list of the electro-metallurgical and electro-chemical processes now in every day commercial use would easily fill a page of this journal.

Great industrial changes have heretofore accomplished themselves on the Atlantic coast without making similar changes on the Pacific coast. The shifting of the centers of metallurgical industry from inland to seaport cities, the great industrial movement going on in the present time at the East is, unlike preceding changes, making a similar change here. To realize this it is only necessary to compare the industrial establishments existing and projected on this line of bay shore three years ago with those existing and projected now. The increase is all out of proportion to the gains of equal but preceding periods of time.

What is now, is only the beginning. The ultimate development here indicated is inevitable. It is coming rapidly. The foundation for it has been prepared in the assembling at one point of the conditions which so united make a commercial foundation for a great center of metallurgical industry. Here at San Francisco is the established commercial seaport center of the Pacific coast, a great linear extent of deep-water frontage backed by constructed railroad lines, the cheapest fuel supply of any great seaport in the world, the cheapest electrical power supply of any seaport city in the world, and ideal climatic conditions. The one factor at the moment short in quantity is a fresh water supply. Present local supplies cannot be much expanded, but the nearest of the Sierra streams, the several forks of the American river, after utilization for power development, may be a second time utilized to provide supply of pure water for future requirements.

The Treatment of Clay Slimes by the Cyanide Process and Agitation.*

NUMBER II.

By E. A. H. TAYS and F. A. SCHIERTZ.

THE PROCESS.—As the slimes, for the most part, presented a stiff hank of clay from 4 to 11 feet deep, they could not he shoveled directly into the cars, hut first had to he sliced off in very thin slices, cut up as fine as possible and mixed with as much of the sand slimes as could he had at hand, after which the material was shoveled into half-ton cars and trammed to the scales. In order to keep it as nearly uniform in character as possihle, it was taken from four different parts of the dump at once.

At the scales a sample was taken from each car hy running a half round, grooved sampler, 1 inch in diameter and 5 feet long, diagonally through the load from one end. These samples were put into a covered tin can and amounted, for the 100 or 116 cars treated daily, to hetween 55 and 60 pounds. This total was dried and the moisture was calculated hefore assaying. The moisture usually ran hetween 18% and 24%, the latter directly after a heavy rain, the former even in the dryest season.

From the scales the cars were trammed ahout 60 feet to the elevator pit, under the tank floor, where they were dumped, and thence raised to the top of the building, at the rate of ahout a ton in five minutes, hy a helt elevator set at an angle of ahout 60°. The elevator cups discharged into a sheet iron hox trough 4 feet long, 1 foot wide on bottom, 2 feet high at the elevator end, and 1 foot at the discharge end. Here the slimes were met hy two streams of solution, discharged vertically downward through a 1-inch pipe at the upper end of the trough. The main solution pipe was 2 inches in diameter, and the solution was pumped up from the lower solution tanks and discharged under pressure. At first one jet was discharged vertically and the other horizontally against the slimes as they fell into the receiving hox; hut we found the two vertical streams to give the hest results.

From the receiving or mixing trough the mixed slimes and solution were run into the agitators by means of three V-shaped launders made of 1-inch hoards, 12 inches wide. These launders had a fall of 1 foot in 5, and each fed two agitators, the material conveyed heing delivered to the agitators in the ratio of 1 part of slimes to 1.5 of solution.

SOLUTION.—The solution was made up in the two sump tanks, 20 feet in diameter and 5 feet high, set up in a pit at a level lower than the zinc hoxes and 15 feet lower than the agitator floor. In our tests solutions were used containing from 0.10% to 0.30% cyanide. All gave good results, hut showed a consumption of cyanide of from 7 to 8 pounds per ton. This had heen the case also when the sands were treated, and in the original experiments made by Mr. Mills it was found that, if the cyanide process were employed, the chemicals alone would cost ahout $3.50 gold per ton. In our experiments, at first we found that titrations indicated hut a slight consumption of cyanide, although the assays showed a good extraction; hut this was due to the addition of lime to the charge at the start. Afterwards, when lime was added at the heginning of the last hour's agitation, we noticed that the titration made after such addition showed from 0.02% to 0.08% higher than the titration made just hefore the additon of lime.

For awhile, after heginning to treat the slimes, we used a standard strength of 0.20% KCy with good results, hut finally dropped to 0.15%, which gave us the hest general results, involving a steady consumption of ahout 7 pounds of cyanide to the ton of slimes treated. After passing 0.20% the consumption of cyanide increased and the extraction of gold decreased. A 0.25% solution, used for twenty days on the same general character of slimes, showed a consumption of 8.75 pounds of cyanide per ton and an extraction of hut 74.98% of the gold and silver, while the 0.15% solution used in the succeeding month showed a consumption of 6.21 pounds of cyanide, with an extraction of 78.56% of the gold and silver. The value of heads in these cases were $13.34 and $13.59, respectively.

Analyses of the solution showed that it carried the metals and minerals shown helow, and in the proportions given.

No. I represents the solution as drawn off at the heginning of the decantation. No. II is from the discharge of zinc hoxes when No. I was supposed to he running through.

	I. Grams Per Metric Ton.	II. Grams Per Metric Ton.
Cu	422.9	293.2
Fe	Nil	Nil
Al	32.5	34.8
Zn	209.5	120.5
Ca	458.0	384.8
Insoluble residue	38.5	38.0
Au	4.82	0.03
Ag	6.50	0.08

This solution had heen in use for ahout ten months.

AGITATION.—As already remarked, the old tanks, 20 feet in diameter hy 5 feet deep, were utilized for this purpose hy introducing the machinery of an ordinary settler, modified to suit the use to which they were to he put. The inside cone stood 4.6 feet from the floor of the tank and was holted to a ¾-inch plate, 3 feet in diameter. This, in turn, was bolted to the hottom of the tank, which was 3 inches thick.

On top of this cone sat a muller with four 9-foot arms, which were set 7 inches ahove the hottom of the tank, when the muller was down. To each of these arms were holted, at an angle of 30°, three wooden shoes, 6x8x36 inches in size. The outside and inside shoes had a 1-inch strip nailed to the bottom, while the center shoe was left 1 inch higher, since we found that stray rocks, gravel, etc., gathered there, and in this way, not heing caught hy the arms as they revolved, did little damage. The mullers were arranged so that they could he raised 3 feet, and, after we got to running regularly, they made nine revolutions per minute. At first we had them make fourteen revolutions, hut soon found that speed to he too great, as it caused the charge to foam excessively, even with 3-inch wings.

At equal intervals were placed four wings, 3 inches wide, 2 inches thick and 4.5 feet high. During the first experiments these wings consisted of 2-inch plank, 12 inches wide and 5 feet high, hinged to the inside of the tank. To this was holted a 4-foot piece of 2-inch plank, horizontally, at a height that would just clear the top of the muller arms when down and in motion. This was set at any angle desired, and, when the muller was to he raised, could he turned in against the side, out of the way. But it was found to give too much resistance to the current, producing much foam. The horizontal arm was taken off and the vertical, movahle wing used alone. This was gradually swung hack against the side of the tank until the edge alone offered resistance to the current. This, although hut 3 inches out, was ample, so, after that, strips 3 inches wide were screwed against the sides and used up to the end of the run.

To prove that these wings were necessary, we had one charge run without them. The outer surface of the charge rose ahout 12 inches higher than the center, and the general surface was smooth, whereas with the 3-inch wings the charge was level clear across, while in motion, and the whole surface was kept in constant ehullition, the currents starting from each wing making chords suhtending more than one-third of the circumference. That agitation was perfect was proved hy numerous samples taken from the surface of a charge while in motion, and from the same while discharging from the hottom.

THE CHARGE.—The slimes and solution as mixed (1 : 1.5) were delivered to the agitators in motion, ahout 5 tons of the clear solution having heen previously charged, though this was not absolutely necessary, as the amount of solution necessary to make up the charge could he, and often was, added at the last. The aim, however, was to have the charge ahout as it should be at the time the last slimes were run in.

As a rule, charging occupied ahout fifty minutes, and there were charged to each agitator about eighteen carloads, containing in all about 11 metric tons of moist slimes and 28.5 tons of solution, or a total of ahout 39.5 tons. This would bring the charge to within 8 inches of the top of the agitator.

The total charge thus consisted of 1 slimes to 2.6 solution, hut since, as a rule, the slimes contained 18% of moisture, the charge was really 1 slimes (dry) to 3.4 solution. This proportion was observed for slimes containing more than 75% of clay. Where there was more sand we got an excellent settling with charges running 1 slimes (dry) to 2.6 solution.

The charge was agitated five hours from the time when charging hegan. This period was found to he ample, as the following tahles of extraction will show:

TABLE I.—RATE OF EXTRACTION WITH 0.20% KCY SOLUTION.

(Charge, 10 tons slimes, 10 tons solution. Samples every two hours from surface. Test No. 2, April 15, 1900.)

Hours	Gold—Grams per Ton	Silver—Grams per Ton	REMARKS.
0	22.20	37.80	
*1.30	12.00	20.00	* Finished charging.

*1.20	7.20	19.20	Maximum extraction is evidently
3.20	6.00	14.40	reached. Tails assayed 4.60 grams
5.20	6.40	14.60	gold and 10.40 grams silver per ton.
7.20	6.00	12.00	Extraction: Gold 78.3%, silver
9.20	6.00	10.40	73.72%.

It will he noted here, also, that hy the time the charge had heen run in—one hour and twenty minutes—66% of the gold and 53.5% of the silver had heen extracted. This was undouhtedly effected hy running at high speed through the troughs from where the slimes and solution mix, to the agitator, and hy the agitation during churning.

TABLE III.—RATE OF EXTRACTION WITH A 0.30% KCY SOLUTION.

(Charge, 10 tons clay slimes, 20 tons solution. Samples every two hours from surface. Test No. 4, April 20, 1900.)

Hours	Gold—Grams per Ton	Silver—Grams per Ton	REMARKS.
0	21.00	28.20	
*1.50	5.20	14.80	* Finished charging.
3.50	3.50	8.60	Tails assayed 4.20 grams gold and
5.50	4.40	10.80	9.20 grams silver per ton.
7.50	5.20	11.60	Extraction: Gold 84.4%, silver
9.50	4.00	9.20	67.4%.

This test shows that the extraction had virtually ceased in four hours.

TABLE IV.—RATE OF EXTRACTION WITH A 0 22% KCY SOLUTION.

(Charge, 5 tons clay slimes, 15 tons solution. Test No. 5, April 21, 1900.)

Hours	Gold—Grams per Ton	Silver—Grams per Ton	REMARKS.
0	22.00	38.00	* Finished charging.
*0.45	6.20	17.00	Discharged tails assayed 3.80 grams
2.45	5.00	13.10	gold and 8.20 grams silver per ton.
4.45	3.60	9.80	Extraction: Gold 82.73%, silver
6.00	4.00	11.20	78.42%.

This charge was agitated but seven hours from the start. In forty-five minutes the charge was in, and samples taken showed that 71.81% of the gold and 55.26% of the silver had gone into solution. Extraction had virtually ceased in four and three-quarter hours from the start. In this test two samples were taken of the tails at the same time, one to he washed and the other to he dried as it was.

The washed sample assayed Au 3.80 grams, Ag 8.20 grams.

The unwashed sample assayed Au 6 grams, Ag 11.60 grams.

This gave an actual percentage extraction of 82.73 Au and 78.42 Ag, and a product ohtainable of 72.72 Au and 69.47 Ag. This would show a loss of 2.20 grams of soluble gold and 3.40 grams of soluble silver per ton. In the regular work the soluhle gold lost was about 1 to 1.5 gram per ton.

The ahove data, and others ohtained from similar tests, led us, when we hegan the regular treatment, to agitate the charges only five hours.

(TO BE CONTINUED.)

THE House Committee on Coinage, Weights and Measures has taken the testimony of leading manufacturing and business houses on the advisability of adopting the metric system of weights and measures. Among those heard were Prof. Elihu Thompson of the General Electric Co.; Henry Troemer, an extensive manufacturer; Dr. A. E. Kimmerley, consulting engineer of Philadelphia, and Prof. W. W. Croshy of the Lowell School of Technology. The sentiment was entirely favorahle to the adoption of the metric system.

*Trans. American Institute Mining Engineers, Mexican meeting, November, 1901.

Stateline Mining District, Iron County, Utah.

Written for the MINING AND SCIENTIFIC PRESS by GRANT H. SMITH.

Stateline mining district is located in the southwestern part of Utah, in Iron county, close to the Nevada line, some of the claims extending into Nevada. The mines were discovered six years ago and many claims were located. The mines are situated 16 miles from Modena, a station on the Oregon Short Line Railroad, and are at an altitude of 7000 feet. The wagon road from the railroad is good and the mines are easy of access, lying for the most part on low, wooded hills. The climate is favorable and work may be carried on throughout the year. Wood is good and plentiful, the best nut pine being delivered for from $2.50 to $3.50 per cord, depending upon the situation of the mine. There are two small streams of water in the district, enough for milling purposes on a moderate scale. Water is being encountered in some of the deeper opened mines, notably the Johnny, and while there is no danger of water in excess the Johnny and the Margaret will probably have to pump from their shafts sufficient water for milling purposes.

The ores, with the notable exception of those from the Ophir mine, are what are generally described as free milling, carrying gold and silver associated with a small percentage of iron in several minerals, and a small percentage of manganese. The milliug, with the exception of the Ophir, which has adopted a leaching process, will require breakers, stamps, plate amalgamation, and concentration by means of tables. The cost of milling in a 20-stamp mill should be less than $1.50 per ton, and should save about 90% of the values. With some of the richer ores it may be profitable to cyanide the tailings.

The mines are found in the quartz veins in a great dike which is made up of a succession of flows and intrusions of various eruptive masses which go by the name of porphyries. This dike is a mile wide and several miles long and is highly mineralized. The main and underlying mass is a hard, iron-stained quartz-porphyry, or rhyolite, similar to the formation in which the Bodie, Cal., mines were found, and not unlike the hanging wall, at the surface, of the Comstock lode in Nevada. The other overlying and intrusive masses are of various colors, from white to gray and green, and are less siliceous and more feldspathic. The veins often carry considerable fluorspar, as at Cripple Creek, Colo., though the fluorspar is seldom gold-bearing. Black oxide of manganese is found in nearly all of the veins and occurs in greatest abundance in the ore shoots.

The country rock, which may be described as porphyry, now occupies what was probably the vent from which flowed the great sheets of andesite, trachyte, and other like eruptives, including tuffs and breccias, which cover the country to the eastward for miles. There are no sedimentary rocks in the district nor to the east of it, but a non-mineralized limestone belt lies only a few miles to the west. The range north and south is made up of eruptives. The underlying quartz-porphyry, in which most of the veins have been formed, appears to have been little eroded. In almost all cases the richest rock occurs some distance below the surface, and there is no placer gold worth mentioning in the gulches, suggesting that no extensive ore bodies have been eroded.

The main lines of fracture in the porphyry extend northerly and southerly, and nearly all of the veins in the district have been formed in north and south fissures. These veins vary from mere stringers to 30 feet in width, and upon them are located nearly all of the mines in the district, notable among them being the Utah Spur, Willowvale, Sunflower, Gold Belt, Burro, Creole and Jumbo. All of these mines seem to have considerable quantities of good ore. The north and south veins, as a rule, have good walls and are strong and continuous, the ore occurring in well-defined shoots.

The notable exception to the rule of northerly and southerly veins is the big east and west vein upon which the three principal mines of the district are located, namely, the Ophir, the Margaret and the Johnny. It is presumed that these three mines are on the same fissure, because they are nearly in line and together, because of local similarities, and because no other east and west fissure is found in the vicinity. Connection underground has not been made, however, and the croppings for hundreds of feet at times are covered with slide and wash. There is a known faulting of the vein between the Johnny and the Margaret workings, and there is probably another between the Margaret and the Ophir. This fissure, having broken across the main line of fracture, is characterized by irregular walls, particularly in the Johnny and in the Margaret, and at times in those mines by no means distinct walls, much of the ore being a replacement of country rock and gradually fading into it, like the ore deposits at Cripple Creek, Colo.

Another striking feature of the east and west vein is the presence of silver. The north and south veins, as a rule, carry but little silver, while in the east and west vein the silver values commonly equal the gold values. This is true of the Margaret, though in the Ophir, lying to the west, the silver values predominate, while in the Johnny, on the east, the gold values are in excess. The vein filling is always quartz, with more or less silicified and decomposed country rock. The main values lie in the quartz, though the walls are always more or less mineralized. At times the partly replaced country rock in the veins is very rich. In the Johnny and in the Margaret some of the richest ore is found about enclosures of country rock in the quartz.

The ore of the district may be called low grade, and must be milled on the ground. Very rich samples may be taken from almost any vein, and in a few mines there are large shoots from which some lots of ore running from $100 to $2000 per ton has been and may be sorted and shipped, but most of the higher grade ores would be milled with the other ores, owing to transportation and treatment charges. The east and west vein is somewhat irregular in width, varying from 4 to 15 feet, and the best ore occurs in fairly well-defined shoots, which seem to make at or near intersections with north and south veins. The Ophir has so far developed one very large ore shoot, about 300 feet long, from 5 to 10 feet thick, and extending from the surface to the 400-foot level. The Ophir shaft is now 500 feet deep and drifts from this point to the ore shoots are now being run. Some of this ore is very rich and several hundred tons averaging about $100 per ton have been shipped to the smelters. Another known shoot exists in Ophir ground east of the big shoot, and probably there are others, but the vein has not been explored far east of the shaft, and the croppings are in the main covered with debris. The Ophir has just completed a 100-ton mill at a cost of $100,000.

The Johnny has so far developed three large ore shoots, some small lots of ore shipped to the smelters hyinging over $2000 per ton and much of it over $200 per ton. This mine has produced about $30,000 in the past two years. The shaft is 260 feet deep and no drifting has been done below the 160-foot level. The owners are developing the mine now and will build a large mill next summer. At present they are sinking the main shaft, which is in good ore, and are drifting through a rich shoot of ore on the 100-foot level at a point 300 feet east of the shaft.

The Margaret has thus far developed but one of its known ore shoots. This shoot crops along the surface for 150 feet and is from 3 to 8 feet in width, and averages $8 per ton, though much of it will run from $12 to $15 per ton. It was cut at the 60-foot level and drifted upon east and west for 50 feet, and a full face of ore is exposed in the face of each drift, the average value, excluding the high-grade ore, being about $10 per ton. Mixed with the milling ore at this level was found considerable rich ore running from $50 to $200 per ton. Within a few weeks the same ore shoot will be opened up in the crosscut on the 150-foot level. Another ore shoot lies west of the shaft, but it is undeveloped as yet. It extends for over 300 feet on the strike of the vein and averages more than 4 feet wide. The croppings run from $1 to $20 per ton. The company is now sinking a vertical double-compartment working shaft which at the 200-foot level will interesect the east ore shoot at a point 300 feet below its apex. From this level a drift will be extended west under the west ore shoot for its entire length. The gold in the richest Margaret ore seems to occur in the form of a telluride.

Shannon Copper Co.'s Operations at Clifton, Arizona.

[STAFF CORRESPONDENCE.]

The smelting plant of the Shannon Copper Co. at Clifton, Ariz., is nearing completion and will doubtless be in operation by March, 1902. The plant is located on the slope of the hill, near the San Francisco river, and about a mile from town. There are two blast furnaces, each 44x170 inches, the two having a daily capacity of 600 tons charge. In these there is no brickwork below the level of the charge floor, each having a double row of jackets. The furnaces are built in a steel structure, 42x80 feet in size. A few feet below the discharge is a track for slag cars, the latter being hauled by an electric locomotive. Near the furnace building, and connected with it by a 6-foot blast pipe, is a 58-ton blower, with a capacity of 30,000 cubic feet of air per minute. This is direct connected to, and operated by, a 300 H. P. tandem, compound condensing engine. Blower and engine are enclosed in a 66x80-foot steel building. There is also a smaller engine to operate a generator for light and various motors. Within the adjacent steel boiler room are two Sterling water-tube boilers of 250 H. P. each. The matter of utilizing fuel oil for the boilers is being considered. The dust flue from the blast furnaces to the dust chamber is 10 feet in diameter. The latter is built of stone, is 100 feet long, 20 feet wide and 20 feet high, interior measurement. The dust, gases and fines which discharge from the furnaces enter the upper portion of this dust chamber, the bottom of which is made up of rectangular hoppers, into which the dust settles. Through the hoppers the dust is discharged periodically into cars on tracks below. From the dust chamber the fumes pass through 175 feet of horizontal arched flue to the base of the main stack. This flue is laid on the surface of the ground, is arched over by a steel frame, lathed up on the inside with expanded metal, and both the interior and exterior plastered with cement. The self-supporting steel stack is 150 feet high and 13 feet diameter. It was erected, piece by piece, riveted by compressed air, without the aid of scaffolding. The platforms for the workmen consisted of a circular staging on the inside and a traveling chair on the outside, the inner staging being suspended by chain blocks attached to uppermost course of sheets.

Smelter of Shannon Copper Co., Clifton, Arizona.

On a plane above the smelter charge floor are the twenty-three ore bins, each 20x20x16 feet, with a chute from each. Above the bins is the railroad track, the ore being dumped from the cars to bins automatically.

The water supply is pumped from wells near the river to tanks above the plant. The equipment includes a condenser and two Barnard cooling towers for cooling the circulating water.

Manager P. Wiseman states that to begin with the plant will turn out a black copper product, but that later on a concentrating plant will be erected and two or three stands of converters put in, and the product will then a bessemerized copper. The ores from the Shannon group comprise oxides, carbonates and sulphides. On the operating force M. J. Welch is construction engineer, P. O. Wels smelter Supt.

The mine of the Shannon Copper Co. is about 8 miles northwest from Clifton, overlooking Chase

gulch, and half a mile from Metcalf. A surface tram line, built on an incline of 36°, 1500 feet long and double tracked, is operating between the bottom of Chase gulch and the main tunnel level of the mine. At the foot of this incline are six ore bins with chutes for loading into cars. At the upper terminus are six similar bins which receive the various grades of ore from the mine. The cars on the incline operate by gravity, the 1¼-inch cable winding on a double-drum reel, at upper terminus. These drums are 13 feet diameter, each 5 feet 8 inches wide, and having a 14-inch brake band. This gravity operated hoist runs an air compressor, the latter serving as an auxiliary brake, so as to absolutely control the motion of the loads on the line. The main double track mine tunnel crosscuts to the ore bodies in Shannon hill. It is 715 feet long and cuts about 300 feet below the apex. It is 7x8 feet, was driven in seventy-eight days by hand drilling at a cost of $5 per foot. This tunnel connects with numerous other tunnels, drifts and levels from different directions; and also with workings above it through chutes. Most of the ore blocked out is above this main level and will be taken out through the latter. The ores of the upper levels comprise carbonates and oxides, and those at greater depths are sulphides. At the mine Wm. T. Chino is Supt. and D. G. Davies mechanical engineer.

Clifton, Ariz., Jan. 20.

The Value of Ores in Mexico.*

By N. H. EMMONS.

In the United States the value of gold and silver ores is everywhere reckoned in ounces troy of the metal per "short ton" (2000 pounds avoird.) of the ore. In the case of silver, which fluctuates in market value, the New York quotation on a given day must be known, in order to determine the gross value of an ore at that date.

In Mexico the assay is reported in kilograms of silver or grams of gold per metric ton. As everyone is aware, this is practically a percentage system, 1 kg. of silver per metric ton (1000 kg.) being 0.1%, and 1 gram of gold per metric ton, 0.0001%. The notation is simple and convenient for both assayer and miner.

The Mexican Government purchases at an unvarying price for silver, payable in silver, and at a fixed price for gold, payable in gold if the seller insists, but preferably in silver at about the rate of exchange between United States gold coin and Mexican silver coin. The value of silver is $40.915 per kilogram in Mexican silver dollars. That of gold is $675.416 per kilogram in gold coin. The mints do not, as a rule, issue gold dollars, as the Government keeps them to pay the interest on the national debt. Almost all bullion containing a considerable percentage of gold is shipped to foreign countries, principally the United States, to be refined.

The Mexican mint receives for refining and coining no bullion which is not at least .950 fine in gold and silver, separately or combined. For the fine silver it pays $40.915 Mexican per kilo, less 2% coinage charge and 3% stamp tax. For assaying each bar, not more than 35 kg. in weight, $2.50 Mexican is charged, and for separating gold from silver, $0.75 per kg. of bullion. Gold, if over $\frac{1}{1000}$ is present, is paid for at $675.416 gold per kg.; but payment is made in silver dollars at about ten points below the current quotation of exchange. Finally, the State tax, about to be mentioned, is collected upon bullion, unless it has been previously paid on the ore.

Government charges practically unknown in the United States are the taxes on ores of silver or gold, paid both to the Federal and to the State governments throughout the Republic of Mexico. These taxes, being laid upon gross product without reference to profit, are likely to be so severe that in many parts of the Republic it has been the custom not to insist upon the payment of the full State tax. The Federal tax, however, known as the mining tax, is collected upon all the gold and silver produced in the country—either at the mints upon the bullion presented for coinage, or at the points of export upon ores or bullion shipped to other countries.

The State "extraction tax" is levied on ores mined and is supposed to be collected before the ores leave the mine yard, or "patio." This has been found, for many evident reasons, impracticable, and it has come to be the custom to collect the tax as the ores leave the mining camp, or, if they are treated in the camp, then as the product is shipped away. The Government may accept the sampling and assays of the owners, or an official may be sent to superintend the sampling and take a special sample for Government assay. The manifest of the shipper states the number of metric tons shipped and of kilograms of silver and gold per ton. The collector calculates the silver value of the shipment at $40.915 per kg. of silver, and collects 2% of that value for the State, and also, according to the Federal statute, 30% of the State tax, or 0.6% of the value, as the Federal tax. The total (2.6% on $40.915) is a direct tax on the silver in the ore of $1.0638 per kilogram, or (1 kg. being 32.15 ounces troy) about 3.3 cents per ounce.

If the ore is smelted in Mexico the smelter pays the tax; if it is exported, it must be accompanied with a consular invoice, and sampled and assayed at the border by the Mexican Government. In this case the mintage tax—that is, the charge which would have been made if the bullion had been sent to the Mexican mint—is also collected. For bullion, matte or other metallurgical product this tax of 5% is collected upon the full assay value of the metal contained. For ores it is collected upon 90%, and is, therefore, 4.5% of the assay value.

Finally, if ore is sold to any purchaser in Mexico, there must be a bill of sale, or "factura," on which revenue stamps to the amount of 3 cents for every $5 or fraction thereof are affixed and cancelled by the seller. This stamp tax is not peculiar to sales of ore. It is required for every sale of merchandise amounting in value to $20 or more. The value here contemplated, however, is not the gross value, calculated as above described, but the net value, or the amount paid by the purchaser.

It will be seen that the taxes on ores of gold or silver mined in Mexico comprise 2.6% of gross value as State and Federal extraction tax, plus 4.5% as mintage tax, or, in all, 7.1% of the gross assay value, to which must be added the stamp tax on the factura of 0.6% on the net value.

In order to show how the value of a given ore to the miner is determined, it will be convenient to assume an example, bearing in mind that some of the conditions stated would vary with the locality. In most districts the regular gold price paid by the smelters for silver in ores is 90.5% of the New York quotations; for gold, 95% of the assay, at $19.50 per ounce; for lead, if the ore is a rich lead ore, 1 cent per pound on 90% of the contents as per assay; allowances for freight and treatment being made according to local conditions—the latter according to a regular scale for "neutral" ores, with suitable modifications for departures from that quality. We will assume $9 United States money per "short" ton for freight and treatment, and take as a basis the New York quotations of Sept. 20, 1901, which were 58.25 cents per ounce for silver and 4 cents per pound for lead. Bankers' exchange in the City of Mexico on the same date was 1.165% premium.

We assume also a neutral ore containing per metric ton 1000 grams of silver and 3.43 grams of gold (i. e., 29.167 ounces silver and 0.1 ounce gold per ton of 2000 pounds) and 20% of lead. This ore would pay the miner as follows:

The silver, at 58.25 cents per ounce, would be worth $18.728 United States currency per kilo, and would be paid for, as above stated, at 90.5% of this value, making upon the ore assumed $16.96 for silver. Gold, at $19.50 per ounce, would be worth $0.626 per gram, and 95% of 3.43 grams at this price would bring $2.04. Of the 20% of lead (200 kg. per ton) 90%, or 180 kg., would bring 1 cent per pound, (2.204 cents per kg.), or $3.97. The total for silver, gold and lead would thus be: $16.96 + $2.04 + $3.97 = $22.97 United States currency per metric ton, apart from the extraction tax and stamps on factura, freight and duties. (The purchaser, paying for only 90.5% of the silver and 95% of the gold, assumes the mintage tax.)

Deducting the assumed treatment charge of $9 per short ton, which is $9.92 per metric ton, we have as the net returns to the seller $22.97 — $9.92 = $13.05 United States currency per metric ton. But from this he must pay the extraction tax of 2.6% on the nominal value of $40.915 per kg. of silver and $675.416 per kg. of gold (reduced to silver at about 2.10 exchange), or, upon the ore here assumed to contain 1 kg. silver and 3.43 grams gold per ton, $1.18 in Mexican money, and also the stamp tax of 3 cents for each $5 Mexican money. Reducing the above return of $13.05 to Mexican money, we have ($13.05 × 2.165) $28.25, which would require 18 cents stamp tax. Consequently, the ultimate net return to the seller would be, in Mexican money, $28.25 — ($1.18 + $0.18) = $26.89.

Recalculating on the American basis of ounces per short ton, we would have as the value per short ton of the ore under consideration:

Silver: 90.5% of 29.167 ounces at 58.25 cents	$15 38
Gold: 95% of 0.1 ounce at $19.50	1 80
Lead: 90% of 400 pounds at $0.01	3 60
Total in United States money	$20 78
Less treatment charge per ton	9 00
Net value in United States money per short ton	$11 78
Or, in Mexican money, at (2.165)	25 50

From this we have to deduct the extraction tax, which is, above stated, $1.18 per metric ton (2.204 pounds avoird.), and would therefore be per "short" ton, $1.18 + 2000 ÷ 2204 = $1.07, Mexican money. And, finally, the stamp tax on the factura would be, as before, 18 cents, making total deductions of $1.25. Subtracting this amount from $25.50, we have a final net return per short ton of $24.25 Mexican or $11.20 United States currency. It will be understood, of course, that this calculation is simply a restatement of the one previously stated, and is introduced simply to facilitate comparison for those who are not accustomed to reckon by the Mexican method.

Two comparative statements will be specially interesting to American miners and sellers of ore, as showing, respectively:

1. What would be the net return in the United States for ore sold under the same conditions, i. e., with freight and treatment at $9 per ton, and lead quoted at 4 cents per pound in New York; and

2. How the value of such ore in Mexican money will be affected by an extremely high or low market price of silver.

1. Ore of the character assumed above, if mined in the United States and sold under the same conditions as to freight and treatment charges and price of lead, would return to the miner 95% of the silver value, or $16.14, instead of $15.38; 100% of the gold value at $19.50 per ounce, or $1.95, instead of $1.80; and 90% of the lead value at full New York quotations of 4 cents per pound, or $14.40, instead of $3.60, making a total of $32.49, instead of $20.78, per short ton. Deducting $9 for freight and treatment, we have $23.49 United States ($50.86 Mexican) as against $11.20 to the Mexican miner of the same ore, situated at an equal distance from the smelter.

2. The effect of fluctuation in the price of silver upon the value of Mexican ores may be illustrated by assuming that silver is quoted in New York at 40 cents per ounce, instead of 58.25 cents, as in the above examples. In that case, exchange will be forced up to $3.18. We would then have, per ton of 2000 pounds, 95% of 29.167 ounces, at 40 cents, or $10.56, instead of $15.38 for the silver, and the other items would remain unaltered, so that the total would be $15.96, or, after deducting $9 as before, $6.96 United States, which, however, by reason of the higher rate of exchange, would be $22.13 Mexican, as against $25.50 Mexican with silver at 58¼ cents. It will be seen that the increased value in Mexican currency of the gold and lead, due to the lower price of silver and the consequent rise in exchange, greatly diminishes the loss of silver in the ore.

To elucidate still further the bearings of this curiously balanced and complicated set of constant and variable factors upon the Mexican mining industry, let us take as an example a reduction works, located at the mine, and so situated with regard to ores, fluxes, etc., as to be able to produce bullion high enough in silver to be sold directly to the Mexican mint. In other words, the standard value of $40.915 per kg. will be received for the silver, and in lieu of $9.92 United States, charged for freight and treatment, the charge for treatment will be $15 Mexican per metric ton. Omitting, for simplicity, gold and lead, and considering the ore to carry silver only, the miner will receive per metric ton, on ore containing 1000 grams of silver, $40.915 — $15 = $25.81 Mexican, less the taxes and duties above set forth. This return is independent of the price of silver. If silver drops to 40 cents, as above supposed, he will receive $25.91, Mexican, less the same taxes and duties as before—only the exchange value of this sum will be smaller, by reason of the higher rate caused by the fall in silver. But this smaller exchange value does not affect his expenses for labor and power, because wages, fuel and domestic supplies are paid for in Mexican money, without regard to temporary fluctuations in the market price of silver. It is only in the purchase of imported supplies for mining and milling, or machinery, etc., needed for repairs or new constructions, that the difference is felt. Of course, any dividends that might be paid, though they would be no smaller in Mexican money, would be reduced in value to foreign owners by the higher rate of exchange.

Lead has very little value for the Mexican miner, since the price paid for it by smelters is practically nothing, compared to what is paid in the United States.

Copper and gold ores pay more profit to the Mexican miner, whether calculated in United States or in Mexican money, the lower the price of silver and the higher the rate of exchange.

Profits (estimated in Mexican money) from silver ores, if they can be treated locally, at expense chiefly payable in Mexican money, are affected only by the amount of imported supplies required for their treatment. If they go to smelters which make their charges in United States money, the returns will depend on the price of silver and the rate of exchange.

As a general conclusion, it may be said that, by reason of the peculiar conditions explained and discussed above, the mines of Mexico are less dependent upon the market price of silver than those of the United States.

* Trans. American Institute Mining Engineers, Mexican meeting, November, 1901.

PROGRESS on the Simplon tunnel for December, 1901, is reported as follows: The advance of the two main headings aggregated 640 feet, practically all of this being in the north heading. The total advance up to the end of 1901 is 14,500 feet in the north heading and 20,800 feet in the south heading—a total of 35,300 feet. The number of men employed on the tunnel during December was, on the average, 3220, of whom 2296 worked in the tunnel and 924 outside. The north heading was in slaty gneiss rock throughout the month, while the south heading was in a disintegrated calcareous mica schist, requiring difficult timbering and hand drilling. The water flowing from the portals measured at the north end 27 gallons per second and at the south end 230 gallons per second.

THE House Committee on Coinage has made a favorable report on the bill appropriating $200,000 for establishing a branch mint at Tacoma, Wash.

What to do When the Gas Engine Stops.

By Albert Stritmatter.

The question of the exhaust from a gas engine is one which should he considered very carefully in arranging the installation of the engine. As the hurned gases are not pleasant, the exhaust should not he discharged under windows, etc. The pipe will of necessity be very hot and should not he placed in contact with wood or other inflammahle materials. A very nice, although most too expensive a method to he adpoted in a great many cases, is to use ashestos packing or covering around the pipe when it must he run close to woodwork. A great deal of the trouhle from gas and gasoline engines is due to the exhaust pipe not heing arranged correctly. It should he as short as possible and with the smallest numher of hends that are necessary. Where it is impossihle to avoid having a very long pipe, an exhaust pot must he placed close to the engine. Too long a pipe or one with too many hends in it will cause a strong back pressure of hurned gases into the cylinder and this will foul the cylinder and incoming charges to such an extent that they will not ignite, or if they do will give only a weak explosion. If an exhaust pipe is led into a chimney, it should he carried up to the top of the huilding, as the exhaust gases may collect in the chimney and cause damage. Where the pipe is led simply into the chimney, it frequently occurs that through improper mixtures or failure of the igniter, etc., an unexploded charge of fuel will collect in the chimney and be exploded by the flame from the next charge which is exploded and exhausted, which results in an explosion, in the chimney doing considerahle damage. These explosions, when they occur in an exhaust pipe, do no harm except possihly to break some of the muffler plates. They may occur with any make of engine and result from improper mixture, failure to ignite, back pressure from clogged up exhaust ports, valves or muffler, or from too long an exhaust pipe or one with too many hends as explained before.

The exhaust valve and exhaust passages of a gas engine have heen aptly likened to the human intestines or to the sewers of a large city. Therefore we understand that the exhaust system of a gas engine is as important in the successful operation of the engine as are the mixtures, compression and ignition. We have, in the first article, investigated these three operations of the engine and, if we still have not located the difficulty, will look first at our exhaust muffler to see if the perforated plates are filled up with hurned grease, etc. If they are, we will take them off and put them into a fire, thus cleaning them thoroughly, and will then replace them. If they have heen clogged up for any length of time, the prohahlities are that the auxiliary exhaust port, if there is one, and the exhaust valve are likewise clogged with the hurned grease and smoke, and they should he cleaned thorougly also. We are, of course, assuming all along that our engine is properly designed. If, however, we have an engine with too small an exhaust valve, we are sure to have trouhle with prohahly no way in which to remedy. The same will apply to the inlet valves.

One trouble caused from the exhaust pipe is that when the engine is running the pipe gets exceedingly hot and on cooling frequently condenses moisture inside of it. As soon as an attempt is made to start it again, the moisture is likely to he sucked into the cylinder and cause difficulty in starting. The exhaust pipe should, if possible, he placed so that the water cannot run hack close to engine, but if this trouble is encountered frequently a drain cock should he placed at the lowest point in the pipe to enahle the operator to drain off this condensed moisture.

The end of the exhaust pipe must be so located that sand or dirt and water cannot be sucked back into the cylinder and cut it up. This is one objection to placing an exhaust pipe in a chimney without carrying it to the top of the building.

Finally, if we have not yet located the difficulty with our engine, we must look at the various points of adjustment, lubrication, etc. Many engine operators have a wrong idea as to the water cooling system. They think that the water coming from the engine must be very cool. This is not the case for the water circulating system is intended to carry off only the surplus heat. Experiments show that best fuel consuption is obtained when the water leaving the cylinder jacket is not below 160° to 180° or 190°, F., and so long as the water is not actually hoiling no damage is likely to be done to the engine, although 175° or 180° is about the correct temperature. Of course at this heat one could not keep his hand in the water. Where a natural circulating system is used, care must be taken that the overflow pipe is completely submerged. If it is not, air will get into it and stop the circulation of water. This overflow pipe also should be so placed that there is no point in it lower than another point between it and the engine. The object is to have a continually increasing height from the engine to the tank, so that the hot water will have no difficulty in returning to the water tank. To obtain the full benefit of a water tank the bottom of it should be set on a level with the engine cylinder. Frequently if the water used contains much lime etc., there will be considerable deposit in the water jacket spaces so that once or twice a year this must he cleaned out. We must see that the cylinder is properly luhricated, not too much or too little. If too little lubricating oil is given, the piston will expand and stick in the cylinder. If too much is fed, the surplus will stick to the piston rings, etc., as well as fill up the exhaust port and muffler. We must see that the piston end of the connecting rod is properly adjusted to take up wear and yet it must not he too tight. If it is the piston will jump up and down in the cylinder and cause considerable wear in a very short time. The crankshaft end of the connecting rod must likewise be properly attended to, in order to keep the wrist from hecoming too hot, prevent undue wear, etc. The main hearings must be luhricated properly, as well as the other hearings, etc. The governor must he kept in proper adjustment and lubrication for on it depends the steadiness of the speed. Once in a while a governor is so designed that if anything gets out of adjustment or hreaks, the engine runs away. This is the wrong principle, as it should he so designed that if anything goes wrong the engine will stop. Engines frequently do stop without any apparent cause, but really hecause something in the governor is out of adjustment. Perhaps one of the hevel gears may get loose, or something of that kind.

Mention has already heen made of the fact that water condenses in the exhaust pipe on cooling. Frequently water will condense inside the cylinder and cause trouhle in starting. In cold weather this water may run around the valve seats and freeze them tight during the night, causing the valves to stick when starting. This sometimes results in a part of the valve cage or the mechanism operating the valve heing hroken. The valve stems should he tapped lightly in order to loosen the valves from the seats hefore attempting to start.

Often, where a water pump is attached to the engine, it may freeze slightly during the night and may hreak if not warmed up with a torch hefore attempting to run.

As was referred to while discussing the suhject of fuel supply, the operator should study and understand thoroughly the device on his engine for carrying the gasoline from the pump into the cylinder proper. These devices cause a great deal of trouhle from the fact that operators do not understand them and keep them in adjustment or clean. Generally speaking, these devices are the most delicate ahout the engine with the exception of the igniter.

In great many cases they are very complicated, in which case they will require all the more study and attention. But even with the simplest devices care must he taken to keep dirt or other substances out of the apparatus. Many times a small string of waste will get caught in it while the operator is wiping up the engine and this will frequently partially or entirely stop the supply of gasoline.

Engines which have packing joints sometimes cause trouhle from leaks in the packing. The hest material to use for such joints is asbestos board, one-sixteenth of an inch thick, cut to shape and soaked in hoiled linseed oil. If in a hurry and unahle to secure the linseed oil, soap well the ashestos hoard. This will do nearly as well as if soaked in oil. On putting them on, if the flange or head is placed on by several holts, do not draw one bolt clear up hefore straightening the others. Draw up one holt fairly tight and then another, and so on, tightening each one a little in succession. This will give an even pressure all around prevent springing the parts. The same process should he followed in screwing in valve cages, where they are secured in this manner.—American Manufacturer.

Commonwealth Mill and Mine.

[STAFF CORRESPONDENCE.]

The Commonwealth mill at Pearce, Ariz., is equipped with eighty stamps, 950 pounds each, which make 102 drops per minute. They crush ahout 210 tons per twenty-four hours, discharging through a 35-mesh screen. Before going to the stamps the ore is broken by a Blake crusher and a set of roughing rolls. There is no battery nor plate amalgamation, the material passing from stamps to settling tanks, from which the water and fine slimes overflow and pass to other settlers. The pulp from settlers goes out through side gates into the amalgamating pans, containing the quicksilver, bluestone, copperas, salt and sulphuric acid, two pounds to the ton of the last being used. The pan agitators make about seventy-one revolutions per minute. After five hours of agitating in the pans the pulp is drawn out into round settlers, in which the agitation is slower.

The ores are a hard and decomposed quartz and talc, carrying chloride of silver and free gold, with some argentite in places. As depth is gained in the mine, the silver is said to decrease and the gold to increase. The main working shaft is on an incline and sinks to a depth of 475 feet, striking water level at 425 feet. The ledge is 40 feet wide in many places, there being some stopes of that width and 200 feet long.

The power for mill engines, hoisting engines and dynamo is supplied by steam from seven water-tube boilers, developing 850 H. P. Crude oil is used as fuel, the amount used being 135 barrels per twenty-four hours. That amount is hauled daily from Cochise station at one load with a twenty-horse team. The mill tailings are impounded below the mill and are expected to he treated at some future time. The manager is H. Brockman, with A. Y. Smith Supt., D. T. Swathing mill Supt., Meyer Bros. day and night mine foremen.

Pearce, Ariz., Jan. 9.

Transvaal, South Africa, Mining.

J. H. Hammond says to a Boston News Bureau representative: The South African unpleasantness is an interlude in the Transvaal's mining history, a result of its mineral wealth and prohahly a necessary evolution in its mining progress for the aholition of the old ahuses.

The prize of the struggle—the Witwatersrand, or White Waters Range—is unique in the world's mining records, and I do not wonder at the growing enthusiasm in London at the prospect that it will soon he recovered. London is renewing its old interest in Kaffirs, and is planning great things in that line.

The Rand is the world's richest storehouse of gold, all in what the West would call a little patch of ground, 25 miles either side of Johanneshurg. It resemhles anything hut a mining district, having the appearance of a grazing country. The reefs are accessible and rather easily worked. The deposits are unique in their unparalleled persistence of ore, which is interspersed in the quartz and sandstone. It is not of very high quality, yielding ahout $10 per ton. There are ahout 10,000 stamps in the district, which can crush 7,000,000 tons a year. The war has hlown over Johanneshurg without doing any vital damage to the plants.

Since its discovery in 1885 the Rand has yielded $400,000,000 in gold, and just hefore the war was yielding at the rate of $100,000,000 a year, or one-third the world's production—a rate which some years hefore, when the yield was hut $35,000,000 a year, I predicted would come hefore the end of the century.

Yet with all this richness there may he some disillusionment in the next generation. The reefs, it is true, are over a mile deep, and conditions favor deep mining. The increment in temperature is only 1° for 200 feet, so that we can mine down 10,000 feet. The deposits, however, are not, as asserted, practically unlimited. I helieve the future life of the Transvaal will not exceed thirty years, which means a yield of not much more than $3,000,000,000. In eight or ten years after peace the Rand will have reached its zenith.

The diamond mines at Kimherley will go on longer. At Kimberley they have in thirty years mined fifteen tons of diamonds, worth $500,000,000. The De Beers Co., which controls the output and restricts it according to the market, produces yearly 2,000,000 to 3,000,000 karats, worth $20,000,000. A syndicate purchases the whole output at $5 to $8 per karat. The life of the mines is indeterminate, the company estimating it at 144 years. Mining has heen carried down 1600 feet, mostly in extinct volcanic craters.

In South Africa we compress centuries of mining history into decades, and we hold the world's record in mining for rapidity in exploitation, drilling and hoisting. At Kimherley 2000 tons have heen hoisted up a 1600-foot shaft in one day, while at the Simmer & Jack we sent down a 22x20 shaft ahout 220 feet in one month. We had at any expense got men from the Calumet & Hecla and other companies to do this, hut the work was really done not hy them hut by young fellows just out of college, whom we told to go ahead and use their hrains. South Africa rivals America in disrespect for tradition. In fact, its hrightest pioneers are Americans, and the leading figure among Johanneshurg engineers is Hennen Jennings, a Harvard graduate.

There are many prohlems ahead of the Rand, the chief being that of power. There are no navigable rivers, and practically no waterfalls. The Kaffir, of whom there are 100,000 in the Rand, is lazy and dissolute, and the war has made him worse and scarcer, while the climate makes white menial lahor impossible. The Kaffir will work only long enough to buy a few wives to support him the rest of his days. If it can be done, he must be regenerated and his trihal organization disrupted. Then there are questions of improved mining processes aud of further exploitation, as of the Randfontein, which I recommended in 1899.

After the Rand is worked out there will be little outside of Kimberley worth fighting about. The only other gold deposits are those which were worked in Rhodesia in prehistoric times and are supposed to he those of King Solomon and the Queen of Sheha, which yield about $3,000,000 a year. The country can never support a large population, its resources ahove ground heing meager. Coal and iron are scanty and inferior, and copper deposits insignificant.

Every field of activity in the whole realm of nature may yield something of value to the engineer. His interests are world-wide. As man has climhed slowly up the rugged pathway we call civilization, he has needed more and more the services of the engineer. What was yesterday a theory hecomes a demonstration to-day, and to-morrow we expect the engineer to apply it for our comfort or convenience.

Acme Gas for Mining Operations.

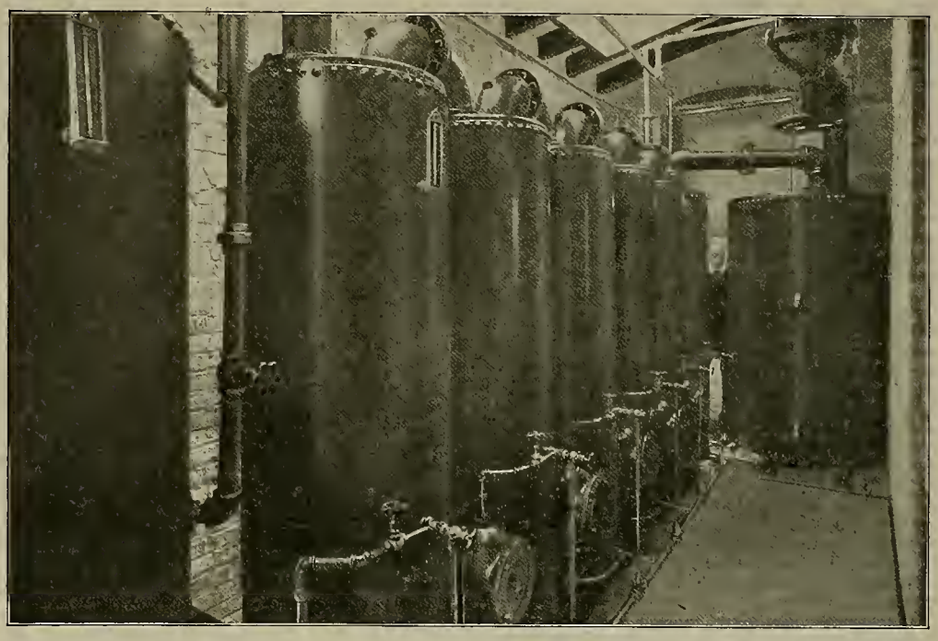
A new fuel is being placed upon the market of importance to mining interests because of its general availability, its low cost, and its adaptability to the requirements of mining operations, such as roasting ores, smelting and running gas engines.

The Acme Gas Co., Monadnock block, Chicago, manufactures and installs individual plants, in which they state that mine operators can generate their own fuel in the form of gas for 10 cents per 1000 cubic feet. The plant is simple and made in many sizes, from a plant suitable to run a 25 H. P. gas engine, or do a limited amount of furnace work, to one producing 100,000 feet of gas per hour.

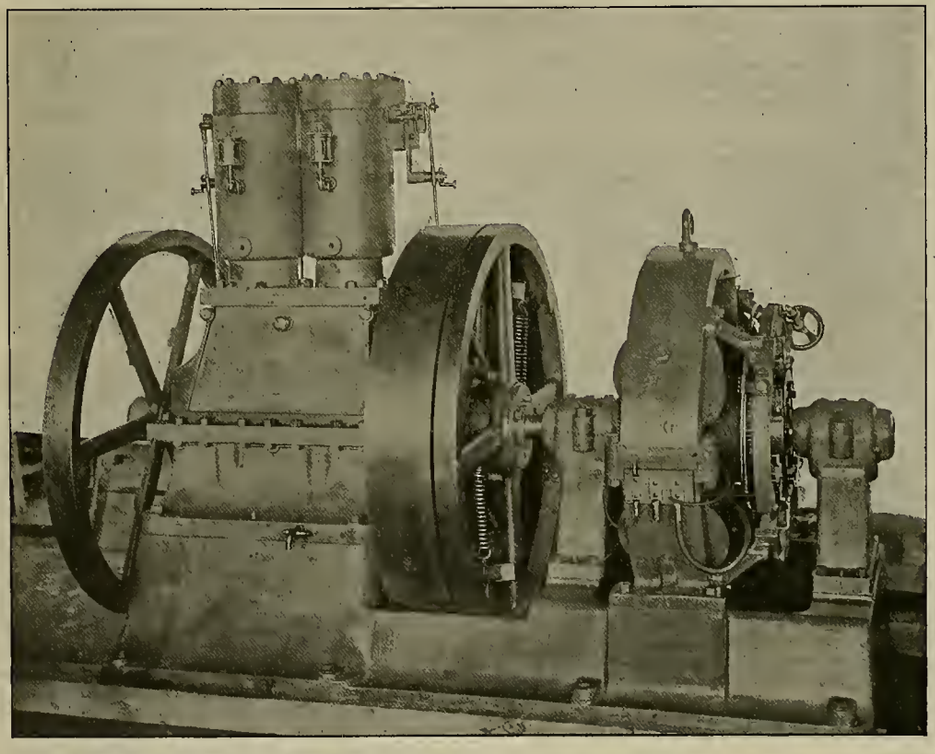
Acme gas is of high calorific efficiency, having several times as many heat units as producer gases, and the manufacturers say the plants are cheaper to install and the cost of maintenance much less than in producer systems. Acme gas is made from crude distillate of petroleum, which contains gas-making properties, and as 1¾ gallons is stated to be sufficient to generate 1000 cubic feet, enough raw material can be transported in comparatively small bulk to generate many thousands of feet of gas; it should be necessary to carry no waste materials.

The recent oil developments in California and Texas have so reduced the cost of petroleum in the West as to make the economy of Acme gas in mining districts very great.

The introduction of Acme gas for use in connection with gas engines has reduced the cost of producing power, making gas engine power cheaper than steam power, even in districts where coal is cheap. As



Cut Showing Generators of a Typical Acme Gas Plant.



Direct-Connected Nash Gas Engine and Dynamo, to be Run With Acme Gas.

nearly as can be estimated, the gas contains 450 B. T. U. to the foot. Thirty feet develops 1 H. P., and with gas at 10 cents the cost per horse power hour is less than one-third of a cent. By this means electricity can be generated cheaply.

Mack Con. G. Mine, Big Oak Flat, Cal.*

Written for the MINING AND SCIENTIFIC PRESS by C. L. LANG.

The Mack Con. G. M. Co., the surface plant of which is here illustrated, is situated at Big Oak Flat, Tuolumne Co., Cal., and consists of two claims, the Mack and the Wooten, being 2300 feet in length, of the Longfellow lode—a contact vein between granodiorite and slate. The vein averages 10 feet in width and has two known shoots each over 300 feet in length, from which mill runs already made show good pay values.

The mill building is 50x70 feet, framed with 8x8 timbers set on a concrete foundation, and covered with galvanized corrugated iron. Ten stamps are now in place, and the plan is arranged for ten more which will be added later.

A new incline two-compartment shaft is being sunk and is now down 270 feet. A station has been opened at the 200 level. The ledge at this point shows over 12 feet in width of soft "sugary" quartz, 4 feet of which will mill over $8 per ton in free gold. The shaft is equipped with a 30 H. P. Lidgerwood model hoist, capable of sinking to a depth of over 1000 feet. One 80 H. P. steel boiler, a 75 H. P. Westinghouse engine to run the mill, a 150 H. P. air compressor, not yet completed, constitute the motive-power equipment. It is intended by the company to run the air compressor by electric power, to be brought in shortly from La Grange dam, distant 18 miles. The using of steam will then be discontinued. There is an arrangement of water tanks by which the tailings from the mill are settled and the water used over and over again, everything connected therewith working almost automatically.

*See illustration on front page.

Protective Timbering in Shaft Sinking.

TO THE EDITOR:—I note in your paper of Dec. 28, 1901, in an article by W. H. Storms, on "Small Things in Mining," a description of fenders or shooting timbers for protecting shaft timbers from flying rock when sinking. I think that I use a simpler mode of fastening them than bolting. I take a chain of about $\frac{5}{16}$-wire, cut it in suitable lengths and put a grabhook on one end. A small notch is cut in lagging near the ends of wallplates and the chain put around the wallplate and shooting timber, catching the hook in a link on top. This holds the timber securely, with no holes to bore, no bolts to stick or nuts to drop in sump. If the timbers hang a little loose, so much the better, as they give a little to the rock in shooting and will not break so easily when struck by the flying rock. To have them tight up to the wallplate, drive a wedge on top between the wallplate and chain. I have found the chain much better and quicker than bolts to put on and take off. I prefer a half-round timber for fenders, as it does not appear to wear as fast as square timber. I use them all round on wallplates and on centerpieces, and my plates are hardly marked with the rock.

Liscum, Ariz., Feb. 10, 1902. JAMES F. SMITH.

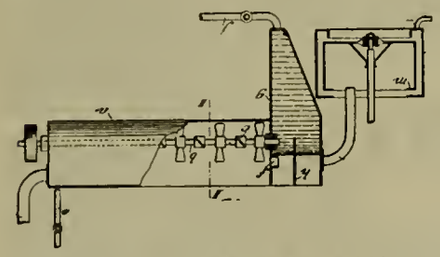
Forge Shop, Navy Yard, Washington, D. C.; Small Ingot Furnace Open, in Operation, With Gas Turned on Full Capacity.

Mining and Metallurgical Patents.

Patents Issued February 11, 1902.

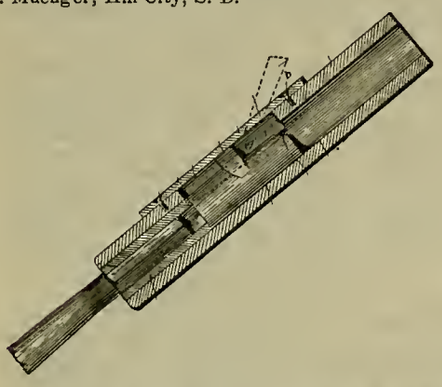
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

APPARATUS FOR SEPARATING MINERALS BY SELECTIVE ACTION OF OILS.—No. 692,643; A. S. Elmore, London, England.



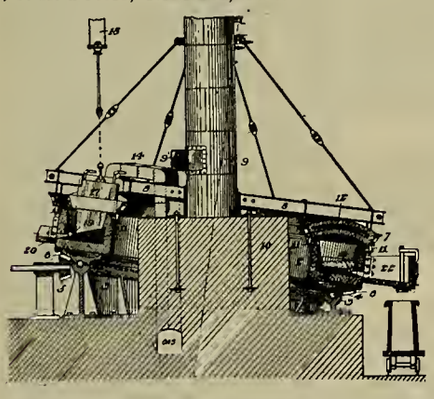
A trough, a shaft adapted to revolve within trough and provided with inclined blades, pipes for delivering oil and water to trough, a subsidence tank arranged at one end of trough, extending below it and communicating therewith, tank adapted to receive liquid mineral pulp and oil from trough, a vertically extending partition arranged in tank at top for purpose set forth, a centrifugal drum arranged at one side of tank, a pipe connected to tank and communicating with drum for discharging into it metallic ingredients and oil, and a pipe connected to tank for discharging earthy and rocky ingredients.

DRIFT PIN FOR DRILLING MACHINES.—No. 693,049; F. Muenger, Hill City, S. D.



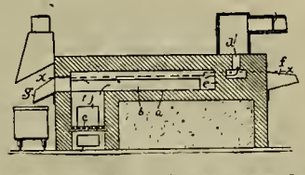
One end portion cylindrical and adapted to engage a bushing when inserted in spindle and its other end portion flattened, and provided with a projecting transverse rib on its side intermediate its end portions by which it can be driven.

TREATING ORES OR SIMILAR MATERIALS.—No. 693,313; J. A. Potter, Cleveland, Ohio.



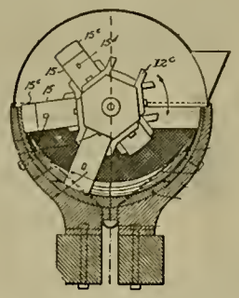
An annular body, and stationary roof, means for rotating body, a charging opening leading into furnace, and having partitions at both sides, furnace having an inlet for combustible fuel, and a stack outlet, stack being in proximity to charging opening and fuel inlet being at a more remote point.

FURNACE FOR REFINING LEAD AND ZINC FUME.—No. 692,972; F. L. Bartlett, Canyon City, Colo.



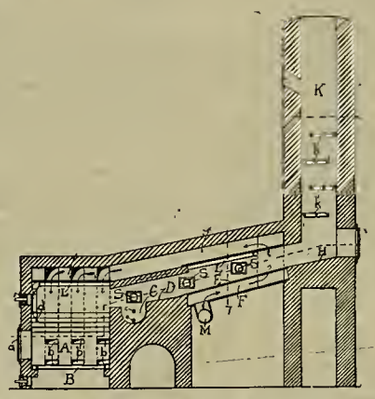
A flat hearth, a feed opening at one end and a discharge opening at other end, a fire box on each side of discharge opening below level of hearth, vertical flues leading from fire boxes to hearth and bridge walls extending diagonally from front to sides, separating fire boxes from hearth.

PULVERIZING MILL.—No. 693,089; C. Wallace, Denver, Colo.



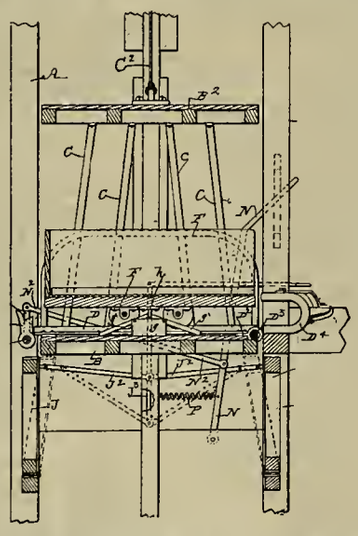
A suitable mortar or casing, a rotary prism-shaped yoke or stamp holder, provided with openings and having hollow journals, whose openings communicate with adjacent stamp openings of yoke, stamps located in openings in which they are normally adapted to slide, each stamp adjacent journal having a recess, and a pin located in opening of each journal and adapted to enter recess of adjacent stamp whereby latter is locked from sliding movement.

ROASTING, SMELTING AND MATTING FURNACE.—No. 693,076; W. D. C. Spike and J. T. Jones, Tacoma, Wash.



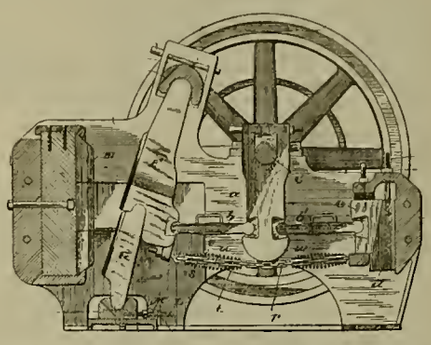
The combustion chamber, smoke stack, metal well, melting hearth and roasting hearth located adjacent to each other and communicating one with another and located between combustion chamber and smoke stack, and preliminary roasting means, consisting of a number of tilting grate bars located one above other in smoke stack at opposite sides of stack, the inner ends of grate bars along one side of stack extending over bars projecting from other side and adapted when tilted to discharge contents onto opposite set of grate bars, and inner ends of both sets of bars terminating short of adjacent wall of stack to cause products of combustion to pass in a zigzag course through stack and around grate bars.

CAR DUMP FOR ELEVATORS IN MINES.—No. 692,888; J. Moses, Youngstown, Iowa.



Parallel uprights fixed in shaft, frames pivotally connected at their lower ends to parallel shafts, rods pivotally connected with upper portions of frames, a lever connected with rods for adjusting frames, a cage fitted between parallel uprights, track rails for car pivotally connected with one edge portion of floor of cage, hook-shaped stops fixed to crosspiece at top portions of uprights for engaging car wheels, detents pivoted to top and central portion of floor of cage for detachably fastening car, a car on track rails, an iron fixed on under side of car to engage detents, a rock shaft journaled to uprights of frame in shaft, props fixed to rock shaft to support free ends of track rails, means for adjusting rock shaft and props and means for raising and lowering cage.

ROCK BREAKER.—No 693,288; G. Lowry, Tiffin, Ohio.



A stationary jaw, a vibrating jaw comprising a lower section supported and fulcrumed at lower end, an upper section supported by lower section and having a bearing upon upper edge of lower section, upper section also being provided with a bearing and fulcrum at upper edge and means for operating the vibrating jaw.

GAS DETECTING ATTACHMENT FOR MINERS' SAFETY LAMPS.—No. 692,885; M. D. Mackie, Scranton, Pa.

A miners' safety lamp, a gas detector comprised in a sheath or tube extending vertically through bowl of lamp, a sliding rod extending through sheath and slidable therein, the sliding rod supporting a loop of platinum wire or other substance having an affinity for burning marsh gas, the substance being supported directly over flame of lamp and shiftable upward and downward, together with a graduated scale for indicating the various percentages of gas according to effect of flame on substance aforesaid.

PROCESS OF TREATING ORES.—No. 693,148; E. B. Parnell, Carshalton, England.

The subjecting of refractory ores to the action of chromic acid and then roasting them.

The Commercial Importance of Aluminum.

Taking the specific resistance of aluminum at 2.76 and copper at 1.696×10^{-6} ohms (Matthiessen's standard) at 15° C., the diameter of the aluminum wire will be 1.27 that of the copper. For equal conductivity it follows that the insulation on covered aluminum wires will be greater, but the covered wire will be still less in weight than the copper. It is as a bare conductor for long-distance transmission that aluminum has been largely used, and it is therefore necessary to consider the tensile properties and change in length due to change in temperature. The commercially pure aluminum alluded to above has, when in the form of wire 0.126 inch (3.2 millimeters) in diameter, a breaking load of 28,200 pounds (12.6 tons) per square inch, a limit of elasticity 19,376 pounds (8.65 tons) per square inch and percentage extension 0.19 within the limits of elasticity with an applied force of 16,250 pounds (7.2 tons) per square inch. Alloying this aluminum with copper, zinc, nickel or iron in varying proportions to the extent of about 2%, increases the tensile strength at the expense of conductivity. The tensile properties of aluminum are increased by rolling, hammering or drawing. In testing wires, therefore, different results may be obtained from the same material by varying the amount of drawing down. Copper and nickel-copper alloys can give about twenty tons breaking load, sixteen tons limit of elasticity, percentage extension 0.19 with 7.2 tons per square inch applied and conductivity about 52% of copper. Hard-drawn copper has a breaking load of about twenty-eight tons and limit of elasticity twelve to thirteen tons per square inch, a percentage extension of 0.10 with 7.2 tons applied per square inch and a linear coefficient of about 0.000017 per 1° C.—Electrical Review.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The Yellow Jacket M. Co., T. H. Ellis president, of Seattle, Wash., has changed its plans regarding the erection of a stamp mill on its Windham bay properties, and now proposes to joint the California-Alaska M. Co. of Los Angeles, Cal., which owns two claims on the same ledge in the joint construction of a 20-stamp mill to mill the output of both properties. The mill is to be erected on the Yellow Jacket property, utilizing its water power, each company to share the costs of developing the water power and erecting the plant. The erection of the plant projected will begin in the spring about May 1.

The Mine Securities Co. of New York have made a contract to buy the control of the eighteen claims making up the Northern Belle G. M. Co.'s property at Berners Bay. The Mine Securities Co. have agreed to enlarge the present milling plant of 200 ton capacity to one having a 1000 ton daily capacity. Mill runs show average values of from $6 to $10 a ton, and it is estimated that in a 1000-ton plant the costs will be less than $2 per ton. A water power is to be utilized to run the mill and air compressor plant.

The Treadwell mine and mill works on Douglas Island caught fire on the 11th inst. The Alaska-Mexican compressor building was entirely destroyed; $38,000 on the stamps, mill plates and the 120-stamp mill, with the engine room, were saved. For several hours more than 100 miners were in the lower workings and in danger of death. The fire started in the Mexican compressor building and spread to the hoist building and tramway before warning could be sent to the men in the mines. No lives were lost. The origin of the fire is not known.

ARIZONA.

MOHAVE COUNTY.

J. P. Wallace, manager of the Monmouth Dev. Co. at Kingman, has bought of J. A. Smith and W. D. McCright the Telegraph mine, on Burro creek, and has bonded the Burro mine, adjoining. A sampling of the mines indicates an average ore value of more than $10 in gold and silver. Mill sites have been located and a site for a dam in Burro creek and flume have been selected. It is the intention of the company to generate power from the stream for mining and milling purposes.

The Lenore M. Co. has its new mill machinery on the ground at Hardyville, and has started to put it up. The company has a bond on the Rattan Ruth mines. The ores from the shaft of the Rattan are said to carry high values.

In the north drift in the Tennessee mine, Chloride, a new ore shoot has been cut, the ore from which, it is said, will run hundreds of ounces to the ton in silver.

PIMA COUNTY.

A high-grade copper mine near the Gila river is being worked under bond by Soto & Hooker. There is about 100 feet of work done, and shipping ore is being taken out. Shipments are being made. The ore is packed on burros over the mountains to Willcox, a distance of 60 miles. The mine is owned by Cleland Bros. of the California ranch, near Tucson, who have bonded it to Soto & Hooker.

The Calabasas Copper Co., in the Santa Rita mountains, has commenced the production of high-grade copper bullion. This company is organized and operated by Douglas, Lacy & Co., of New York City.

Ground for a smelter at Pima has been secured by St. Louis people, who expect to commence the erection of a plant in a short time.

PINAL COUNTY.

The Mammoth gold mine at Mammoth has been sold to F. W. Fletcher of Alpena, Mich., representing the bondholders, by the receiver—G. P. Blair—who had been made Supt.

The Bobtail M. Co. has bonded the Miller gold claims, on the Gila river, near Florence. The vein is from 10 to 12 feet wide and regarded as a $10 per ton proposition. The present development is 175 feet.

The Newbury mines, 18 miles northeast of Florence, are now being operated by a Boston, Mass., company. A hoist and pump are being placed on the Lander claim, which is one of the group. The present depth is 200 feet. The latest assays are claimed to show gold values of $30 to the ton, forty ounces of silver and 3½% copper. The White Elephant claim has a vertical shaft down 150 feet. The vein is on a contact between porphyry and slate and varies in width from 5 to 10 feet, and the outcropping of the vein is continuous for several miles. On the surface the principal values are copper, and the claims were located for it, but gold seems to be the chief product of the claims at this time. The gold and silver values seem to increase as depth is attained.

A. L. Brooks of California and M. Smith of London, England, have bonded the Westfall copper group, near Florence, from J. Westfall.

YAVAPAI COUNTY.

At the Iron Queen mine of the G. A. Treadwell group, at Jerome, the shaft is now down 200 feet and a crosscut has been started toward the ledge, which Manager E. D. Treadwell expects to cut within ten days.

CALIFORNIA.

CALAVERAS COUNTY.

Work has been commenced on the North Hill hydraulic mines, 3 miles from Milton. A large reservoir at Salt Spring valley will furnish water for hydraulic purposes.

Good rock is reported struck in the Easy Bird mine on French hill, near Mokelumne Flat. The tunnel is in about 150 feet, showing from 2 to 8 feet of ledge. The owner is a Mr. Haywood.

The Angels Quartz M. Co. are preparing to put up a 60-stamp mill on their property at Angels and have started the grading for it.

P. Lancell has made a rich discovery in gravel on his ranch near Mokelumne Hill. A 20-foot shaft opened gravel that averaged 25 cents to the pan.

EL DORADO COUNTY.

Supt. W. E. Thorne of the Gold Bug mine, at Georgetown, states that the hydraulic elevator has been started up and is working smoothly.

It is reported that in the vicinity of Pilot Hill and Centerville more prospecting is being done now than for a number of years past. Shipping ore is being taken from the Little Emma copper mine.—— The Julian quartz mine is being reopened and the Pilot Hill mine is to be started up again by W. A. Freeman and others of Auburn, who have bonded it.——The Wilhelm will be started up again as soon as heavier machinery can be put in.

NEVADA COUNTY.

Work is to be resumed at the Gold Tunnel mine, or California mine, at Nevada City. Supt. Lawrence says new machinery will replace that now on the property.

A strike has been made on the Bonnie Bee mine, near Emigrant Gap, 200 feet in on the main tunnel. A shoot of ore is being opened that goes over $50 per ton. Machine drills are being used and rapid progress is being made in developing the mine. As soon as spring opens a 10-stamp mill will be erected.

S. Jones has bonded P. Curnow's quartz mine near Columbia Hill at $10,600. Mr. Williams is in charge of the development work.

SAN BERNARDINO COUNTY.

At the 300-foot level in the Bagdad mine at Bagdad a 5-foot vein of free milling ore that runs $15 to the ton has been struck. Development work is employing twenty men.

The Roosevelt M. Co., adjoining the Bagdad, has struck 8 or 10 feet of ore claimed to go $50 to the ton. S. Washburn of Pasadena is president and E. E. Selph secretary and treasurer.

SHASTA COUNTY.

The United Copper group of seventeen claims in Flat Creek district has been bonded by W. Candrick, C. Butler, P. O'Mara and T. Montgomery to S. Weil of San Francisco at $16,000. Development work must be commenced within sixty days.

It is reported that the fire in the Mountain Copper mine is about out and that danger to the miners from this source will soon be over. A big stream of storm water has been flowing into the mine and is believed to have finally extinguished it. Streams of green-colored water are now running out of the mine, carrying away copper in solution. To save some of this, the company has sent several carloads of scrap iron and tin to the mine to be placed in the streams, to precipitate it as cement copper.

It is reported that very shortly a smelting plant will be built at Kennet jointly by the De La Mar Co., operating at Bully Hill, and the Trinity C. Co., operating at Kennet. The Shasta King mine, of the Kennet district, is reported sold to Captain De La Mar.

SISKIYOU COUNTY.

(Special Correspondence).—The Yreka M. & M. Co. mill at Rollin made a run from Nov. 23 last to Jan. 2 and crushed 1500 tons of ore, producing about $14,000 in bullion and $6000 in concentrates, the latter averaging about $35 a ton. A lower tunnel 1000 feet long is projected for construction this summer to open the Mountain Laurel vein below the shaft bottom. The present compressed air hoist is operated to full capacity when the mill is running. A new shoot 25 feet wide has been struck in the Mountain Laurel claim. The Ohio, Blanche and Aida claims lying high up on the mountain have been prospected and show large bodies of $6 ore. An aerial tramway is to be put in this summer to get this ore down to the mill.

The Fagundes 5-stamp mill at Rollin is running steadily on ore from that mine.

The Salmon River Co. are working the Myers claim about a mile below Sawyers Bar.

Rollin, Feb. 16.

The hydraulic plant, erected by N. Graves, of Yreka, under contract, has been completed and accepted by the Deadwood Placer M. Co. Necessary preliminary work is being done. F. W. Mahler is Supt.

TRINITY COUNTY.

M. Jones, T. O'Keefe and J. Ryan, owners of the Fairview mine, near Minersville, have the property under bond at $60,000 to the Altoona Q. M. Co. J. H. Porter is Supt. The development work is said to be showing up well.

The late rains have furnished water for mining and all the placers in the county are engaged in washing. At the Sweepstake mine, near Weaverville, three giants are at work using the water from the West Weaver creek.

A strike is reported in the Hall mine at Hall City. The vein is supposed to be a continuation of the Midas ledge of Harrison gulch.

TUOLUMNE COUNTY.

A rich ledge of gold-bearing rock, it is reported, has been uncovered in the Experimental Gulch mine, near Columbia.

The Maier property, consisting of three claims near Jacksonville, has been bonded to H. M. Heath of Boston, Mass., at $18,000. Much development has already been done.

A. Carter has sold to the Blue Eagle G. M. Co. the Blue Eagle Tunnel & Tunnel Site, the Blue Eagle and Elizabeth mill sites, near Carters; also, water right to 200 inches in Jawbone creek.

C. Restano, F. R. Restano and wife, G. Restano and wife, D. Restano, D. Dentone and wife have bonded the Comstock ranch, near Columbia, to the Golden West M. & M. Co. at $30,000.

The Stockton Gravel M. Co. has recently uncovered good pay gravel in its drift mine in the Jupiter district, near Columbia.

Supt. Smith of the Horseshoe Bend mines, near Columbia, says a hoist will be placed on the mine shaft, now down 90 feet, the bottom being in good ore.

At the New Era and California mines on the mother lode near Columbia, Nagel & Thomas, the owners, are doing development work and report getting excellent surveys from rock struck lately.

At the Dreisam mine, near Carters, V. Rosasco, Supt., it is reported that the Yellow Jacket ledge has been struck on the 400-foot level. The vein is a foot wide and very rich. The mill is to be started up.

E. M. Scanavino is working men at the Duffield mine. He has run a drain tunnel, the face of which is 130 feet from the surface. Thirty tons of ore averaging about $15 a ton have been taken out.

YUBA COUNTY.

A Keystone drill has been installed on the O'Brien tract, near Sheep Dip, east of Marysville, where the prospecting, which was commenced last summer, will be resumed. Two other similar drills will also be put to work, while the dredgers are under construction.

COLORADO.

CLEAR CREEK COUNTY.

An application has been made on the part of Denver people for the privilege of mining for mineral under the town of Georgetown. W. Layden already has a concession covering part of the town. The presence of good lodes inside the limits of the townsite has long been known, and in several instances excavations made for purposes other than mining have exposed good veins of mineral.

A contract to drive 128 feet in Tunnel A of the East Argentine M. & T. Co. has been let to Piltz & Dunn, who have commenced work. In the distance to be covered two or three lodes will be intersected.

The contractors on the Mystic Tunnel of the Empire T. Co., at Empire, have completed their contract of 300 feet. The heading is in a large vein showing 4 or 5 inches of solid ore and heavily mineralized throughout.

The preliminary work of survey and proving up of values on fifty claims located by the Marshall-Russell Tunnel Co. at Empire, and development by an 8000-foot tunnel, has been started. A building has been erected at the portal of the tunnel for offices, machinery and blacksmith shops. The main tunnel will carry a double track and a 5-drill machine will operate two large and one small drills in the breast. A trestle over the railroad leads to the waste dump and to a milling plant to be erected by the company. The water power of Clear creek will be used and a flume 1000 feet long will carry the water to a power house containing a double turbine wheel and other machinery necessary.

B. F. Kelly, manager of the Georgetown Deep M. & Trans. Tun. Co., at Georgetown, has bought from Hood & Maxwell the Boston group of fourteen claims on Democrat mountain for $50,000. The ore bodies, which are large, carry galena, pyrite, silver and gold. The entire group will be cut by the tunnel now being run.

It is reported that foreign capital has become interested in the Specht tunnel, started just below Dumont to cut Albro hill. The work is now being done by hand, but it is claimed machinery will go in and the tunnel be pushed for 6 miles to Yankee hill. The tunnel company owns more than 100 claims along the line.

J. O. Collerette confirms the sale of the French Flag mine at Idaho Springs to Cox & Co. The mine has a body of lead ore which carries gold and silver. A gasoline hoist has been installed at the shaft.

CUSTER COUNTY.

The Florence M., M. & S. & R. Co. has been incorporated at Florence, with L. Blaney president and T. H. Newkirk secretary. A large tract of land between Querida and Rosita, including fifteen mining claims, carrying silver and copper, with some gold, has been secured; also a large tract of oil land near Florence is to be developed. The cost of hauling and smelting the ore at the Florence smelter will be about $11.

GUNNISON COUNTY.

The Hard Cash group, near Elko, includes several claims on Galena mountain and is owned by the Sulphide Copper Co. of Denver, J. C. Lewis president and H. Miller Supt. Last summer a shipment of sulphide ore was made that paid well. A machinery plant, including power drills, will be installed.

A concentrator of several hundred tons capacity has been built at Elko and will be operating the coming season. It has been designed and constructed to handle the ores produced in the vicinity.

GILPIN COUNTY.

Work has been resumed on the Gould-Burroughs mine on Quartz hill at Central City after being idle for eighteen years. G. H. Graham and associates of Denver have bonded this mine and the First National Kansas, an adjoining property. A new shaft house 40x60 feet will be built over the Gould 600-foot shaft and a hoisting plant set up.

The Central City pool operating on the Continental mine on Quartz hill are making shipments of concentrating ore to Idaho Springs.

D. H. Allen, manager of the State Ore Sampler Co. plant at Black Hawk, claims that the average values of the smelting ores of this county have increased from 50% to 100% within the past year and a half. P. R. Alsdorf, manager of the Standard Assay office at Central, corroborates this, and instanced a number of late settlements for ore—one for $480 gold to the ton, another at $285 and a third at $216 per ton. These show great gains over previous settlements from the same properties and the values have increased very steadily. It has not been a jump from a low value to a high one, but a regular and continuous increase. This condition, they state, is true of all other properties in the county in which depth has been gained and from which shipments have been made during the past year or so.

HINSDALE COUNTY.

The Hotchkiss Mountain M. Co. has bought the mining claims of J. C. Bothwell and J. Foster, located near Lake City. It is said that considerable work will be done on the Black Wonder mine, near Lake City, during the coming season.

LAKE COUNTY.

The Penn M. Co., at Leadville, is making a steady production of between forty-five and fifty tons of siliceous ore per day. In order that the siliceous material can be moved at all from any of the properties on Breece hill, it must stand a $9 treatment charge, so that the grade must run close to an ounce in gold. Some of the mineral from the Penn, it is claimed, has done much better than this.

The Midas M. Co., at Leadville, is increasing production and the development work ahead of the working ground shows an ore shoot of the largest iron body opened up in the camp. The mine is shipping from 200 to 250 tons a day.

The Valley Leasing & M. Co. has been incorporated, capital $1,500,000, by W. H. Vinton of Brattleboro, Vt., E. C. Robert-

son of Hinsdale, N. H., and W. F. Hogg of Springfield, Mass. The company has commenced work here on the Valley mine at Leadville, J. W. Dean of Aspen being Supt. It has been decided to sink a new shaft 4½x9 feet, in order to reach the oxidized zone of ores of the New Monarch group.

A strike is reported on the mine of the Black Prince Co. at Leadville. Development work at the 300-foot level, it is said, has opened up a large body of high-grade ore which carries gold, silver and galena values. The ore body is in the contact formation beneath the lime. Among those owning in the Black Prince is C. Westlake, manager of the company.

LA PLATA COUNTY.

The discovery of gold west of Trimble Springs and about 10 miles north of Durango is announced. The district was prospected nearly twenty years ago, but values found then could not be mined under the then costs of mining, transportation and smelting. Changes in these costs make it probable that the district can now be worked. Ores shipped to the local smelter show, it is claimed, that the average value has been about $50 per ton. Very little work has been done to determine the quantity of the ore.

MINERAL COUNTY.

The Home M. Co. will, it is stated, probably put in a power plant at the mouth of the Nelson tunnel, consisting of a boiler and compressor.

ROUTT COUNTY.

The Wolverine M. Co., on Big creek near Pearl, is doing development work. There is a showing of 3½ feet of ore, carrying copper, silver and gold to, it is claimed, about $100 per ton.——The Zerke M. Co. has completed its plant and is now sinking on the vein, which shows 4 to 8 feet wide, with 4 to 5 inches of copper glance, oxides, carbonates and sulphide. ——G. M. Harding is the owner of two groups of claims in which good ore has been found.

SAN JUAN COUNTY.

The Green Mountain M. & M. Co., of Silverton, have mapped out a plan of development for the season, including $10,000 for contracts to be let to push the developing levels ahead. W. Bielefeldt has been appointed Supt. He says that should the result of the proposed development show as well as at present, the company will commence the erection of a 100-ton mill.

SAN MIGUEL COUNTY.

The Ophir Con. M. Co. has decided on the erection of a 50-ton stamp mill at Telluride, to cost about $62,000.

The Telluride M. Co. reduction plant, which is being built south of Colorado City, is being enlarged to a capacity of 300 tons daily. The mill employs the bromocyanide process.

SUMMIT COUNTY.

The Augusta M. & M. Co. at Breckenridge, T. R. Griffith manager, has started to upraise from the tunnel level to the bottom of the Juventa shaft. The vein, cut 1100 feet in from the tunnel mouth, is under the old workings. A proposition to use a core drill to prospect the character of the ground ahead of the tunnel is under consideration.

The smelting plant of the Robinson Con. S. Co. at Robinson will be completed within the next two months. There are two pyritic furnaces on the ground, one of them in place. The stack, dust flue and hot air chamber have been built. The power plant will be installed later. Fred G. Bulkley is manager.

The Warren Leasing Co., W. A. Johnson manager, has bought the Juniata property near Breckenridge from M. G. Evans. The property has recently been unwatered and drifting from the bottom of the 300-foot shaft has commenced. C. King is foreman.

TELLER COUNTY.

Ore running from 2.5 ounces in gold to 2000 ounces to the ton in gold has been opened up on the Laura Lee claim on Mineral hill, at Cripple Creek, by S. Peterson and O. Stone, who have the claim leased from F. J. Campbell. The streak, about 8 inches across, shows free gold in the seams in the rock, some of the pieces being as large as a $5 gold piece. A whim will be installed temporarily, until a steam plant can be secured.

The Woods Investment Co., owning 1500 acres of land in Cripple Creek district and controlling forty-two companies, has about fifty different leases in operation on their properties.

F. M. Woods, manager of the Gold Dollar Con. M. Co. at Cripple Creek, says the company has bought a new hoist capable of lifting from 1500 feet. This equipment will be supplemented with a battery of boilers capable of furnishing 280 H. P and a 5-drill compressor.

T. J. Moynahan and associates have granted five leases on blocks of ground lying between the Laura Lee and Cripple Creek for two years. The lessees are to go to work immediately. The company has decided to lease all its Mineral hill property — about 200 acres—in 5-acre blocks for two years at a royalty of 15 cents flat net. In addition, the owners offer a reward of $500 to the first lessee who sends to the reduction plants the first carload of ore that runs over one ounce to the ton.

The Longfellow property, owned by W. S. Stratton, is to have the largest shaft in the Cripple Creek district. The new shaft will be 6½x20 feet in the clear. A large flow of water is anticipated and an immense pumping plant, as well as the most improved hoisting machinery, will be installed there.

The Elkhorn Con. Virginia G. M. Co.'s tract of four acres on Carbonate hill, at Victor, is reported bonded to S. Pullin at $20,000. The shaft is down about 180 feet and considerable crosscutting and drifting has been done.

The Cripple Creek & Boulder Leasing & Dev. Co., owners of the Ella claim at Victor, are putting in an entire plant of new machinery, consisting of a steam hoist and a new 60 H. P. tubular boiler. The main shaft is down 400 feet and by March 1 work will be resumed sinking to 500 feet.

W. A. Otis & Co. of Cripple Creek have thrown all of their idle territory open to lease. It is stated that the terms will be low, and it is believed every block will be working as soon as leases can be made out.

The Rockland G. M. Co. of Maine proposes soon to begin development work on Little Bull mountain at Cripple Creek. The company owns twenty acres there, and has a vein 6 feet wide which carries values from $8 to $12 a ton. A. Cochran of Victor is president and F. H. Swayne of Lynn, Mass., secretary and treasurer.

The Woods Investment Co., it is understood, have decided to take the entire product of the Wild Horse mine and treat the ore at the Economic mill. An experiment on this ore by mill treatment resulted in a success, practically and economically. Some of the ore runs as high as thirty-five ounces per ton. Manager F. M. Woods believes that he could treat this high-grade mineral more successfully in the mill than in a smelting plant.

IDAHO.

ELMORE COUNTY.

A strike is reported from the Ida claim in the Neal district. At a depth of 62 feet a crosscut has opened 18 feet of ore. The average value in gold is about $25 a ton.

IDAHO COUNTY.

The Crescent Con. M. Co., Ltd., has been incorporated, capital $100,000, to absorb the Crescent G. M. Co. and the Columbia G. M. & M. Co. Its office will be at Pierce City. The directors are W. Sweet, L. Baughman, J. Q. Moxley, D. C. Gribble and H. N. Stanton.

The Consolidated Hydraulic Co. of Pontiac, Mich., has made a first payment upon 200 acres of high bar placer ground, situated on both sides of Salmon river opposite Slate creek, near Grangeville, and expects to expend $15,000 in piping water from Slate creek across the river.

OWYHEE COUNTY.

The Sinker Creek tunnel at Silver City, it is reported, has opened a 2-foot vein carrying 6 inches of good ore. The tunnel has been driven about 6000 feet and is to be run about 1000 feet farther. The face is 2100 feet under the crest of the mountain.

SHOSHONE COUNTY.

The Golden Chest M. Co., at Murray, has installed its water power. There are two wheels, a 5-foot one driving the twenty stamps, the rock breaker and the tailings plant, and a 4-foot one working the air compressor, the pumps and the dynamo. They are fed from a 22-inch pipe with a perpendicular fall of 220 feet. The machinery has been driven by steam for about seventeen years.

The air compressor on the Charles Dickens mine, near Wallace, is in operation and development work is to be continued. The mine is bonded to J. M. Patterson of Pittsburg, Pa.

MICHIGAN.

HOUGHTON COUNTY.

M. R. Goldsworthy has obtained from the U. S. Government the right to remove the Osceola stamp mill tailing sands from the navigable waters of Portage lake to recover copper from them. These sands form a great obstruction at the site of the old Osceola mill above Hancock, almost shutting off the entire channel. Goldsworthy will start at the water's edge, dredging up to the tailings to a depth of 24 feet. It is not stated what process will be used in the recovery treatment.

MONTANA.

FLATHEAD COUNTY.

(Special Correspondence).—At the Snow Shoe mine thirty-five men are employed. It is reported that 3½ feet of clean shipping ore has been struck. Supt. D. Bowers anticipates by spring to work a full crew of 200 men in the mine and mill. The hydraulic mining companies of Upper Libby creek are preparing to begin operations with the opening of spring. Some rich placer ground was opened last fall on the Vaughan & Greenwell claim. The ledge on the Cedar mine has widened from 2 to 5 feet. J. L. Scarlett of Libby, the owner, claims assays of $160 per ton. The gold is coarse and the vein is believed to be the source of a portion of placer gold in Libby creek claims. Work on the Mother Lode Co.'s property, near Libby, is to be resumed early in the spring.

The American Kootenai Co. are preparing to put in an electric plant to operate electric drills. At the Brick & Brannegan mine about twenty men are employed. It is announced that ten more stamps will be added in the spring. Cabinet, the postoffice center for the West Fisher gold belt, is having a substantial growth. Considerable clearing is being done and new buildings are going up.

Cabinet, Feb. 8.

GRANITE COUNTY.

D. Armes and associates of Butte have leased the Royal mill near Philipsburg. From eight to ten men are employed. A. B. Ringeling is in charge.

JEFFERSON COUNTY.

At the Buckeye mine, near Basin creek, the new shaft has tapped the old workings. The Buckeye is a well equipped plant and is being worked by the Buckeye M. Co., of which C. J. Davis is the head.

N. W. Pierson of Butte has leased the Miner, near Wickes. The mine is developed by tunnels, one of which is in over 2000 feet. The ore contains gold and silver and averages about $30 per ton. The output at present is from eighteen to twenty tons per day.

A strike of high-grade ore in a 5-foot vein is reported at the Baltimore mine, near Basin. The property is owned by S. Mackey and is operated under lease and bond to W. Owsley of Butte and S. D. Pritchett of Boulder.

LEWIS AND CLARKE COUNTY.

J. H. Longmaid of Helena has taken a four-year bond at $50,000 on the Columbia, Winthrop and Railsback claims in the Seven-Up Pete District, about 60 miles northwest of Helena. The property has a shaft 300 feet deep and 1000 feet of levels. The vein is from 4 to 7 feet wide and gives values of from $6 to $7 a ton, but is said to be difficult of reduction.

As the result of experiments conducted at the cyanide plant constructed last summer to treat the tailings at the Empire mine, at Marysville, a method of precipitation from the cyanide solutions by electrolysis is to be installed. The process is stated to be a modification of the Pelatan-Clerici process. The process consists of passing a current of electricity through a weak cyanide solution containing the gold, silver and other metals, and by the electric current depositing the precious metals upon a series of cathode plates suspended in the solution. At Empire a solution as low as one-tenth of a pound of cyanide to a ton of water is used with success and found to dissolve the gold and silver and not attack the other metals.

MADISON COUNTY.

The Wall Street M. Co. is operating a group of seven claims near Sheridan. Necessary improvements are being made about the mines. W. H. Godfrey is manager.

F. Field of Pony has taken a lease to work the tailings of the Easton mill at Junction, and will install a cyanide plant of moderate capacity. It is reported that the tailings of the Easton mill contain good values.

PARK COUNTY.

The Standard M. Co., C. R. Murdock manager, is operating the Great West, Minnie and Standard claims, near Contact. A 10-stamp mill has been erected and will be started up.

The Milwaukee M. Co., J. M. McNulty manager, is doing development work and getting out ores from its mines at Contact. At present the mill has fifteen stamps, but ten more will be installed in the near future.

TETON COUNTY.

The Chief Mountain M. Co. has been incorporated in Salt Lake City, Utah, to develop a group of claims in the Kennedy Creek district. The incorporators are J. H. Van Pelt of Main, Mont., F. Mazreli of Cardston, Canada, B. F. Caffey, Frank Pierce and E. B. Critchlow of Salt Lake City, Utah, Mr. Van Pelt being the agent in Montana. The capital is $30,000 and the head office at Salt Lake City. The claims are the Group, Sunday, Two For Chief and Abbie Belle.

NEVADA.

ESMERALDA COUNTY.

J. A. Yerington is arranging for the resumption of work in the Pamlico and Lapanta mines in Hawthorne district by an Eastern company.

NYE COUNTY.

The town of Ray, 10 miles north of Tonopah, where the new rich discovery has been made, is a camp with about 200 miners at work upon the leases. The ledges widen out as depth is attained and assays are claimed to show the ore increasing in value on several of the different leases. The following are the results of recent assays made: Keen & Co., $606 27; L. O. Ray, $875.13; August Kunze, $527.01; Lease 17, $387; O'Brien & Co., $916.52; Booth & McKinzie, $575.70; Powers & Co., $482; Gleason & Co., $366.60. Other assays along the ledge range from $12 to $250.

August Kunze & Co. are sacking shipping ore from their lease at Ray that will net them, they say, $200 per ton.

Several leases have been sold, varying in price from $1000 to $2000.

WHITE PINE COUNTY.

The Saxton mine shaft at Ely is down 212 feet and a station is being cut.

The shaft in the Aultman has now reached a depth of 94 feet and shows a large body of ore.

NEW MEXICO.

LINCOLN COUNTY.

A. R. Byrd is developing his Free Gold claim on Bonito creek. At a depth of 20 feet the tunnel shows more free gold than did the surface find. Several thousand pounds of the ore have been taken out for a mill test. A hundred assays made are claimed to average about $100 per ton outside of the rich pockets. It is reported that J. A. Eddy has bought the holdings of A. R. Byrd and J. H. Collard on the South Bonito, consisting of several rich gold claims. Byrd & Collard have let a contract for the sinking of 100 feet on the Crow claim on the South Bonito.

RIO ARRIBA COUNTY.

The King Richard G. & C. Co., at Bromide will soon build a 10-stamp mill on its property.

TAOS COUNTY.

(Special Correspondence.)—The Fraser Mountain Copper Co. is erecting a concentrating and smelting plant in the Rio Hondo district, 20 miles from Taos, and the town of Twining has been started there. The plant building is 100x170 feet, enclosing all the concentrating and smelting equipment. Power is to be supplied by water, a mile of pipe conveying it from the Lake fork and Hondo to four Pelton wheels at the mill. The plant includes a dynamo and an air compressor. A 2300-foot tramway is to be built between the mine and mill. Wm. Fraser, the locator of the property, is manager; the principal stockholders are New York and New Jersey men. C. L. Buckingham, of Denver, Colo., is directing the mill construction.

H. Dorn of Cleveland, O., is at Red River in the interest of the Woodland M. Co., which owns the Abraham Lincoln and other claims at Red River. It is stated that the company proposes to resume operations on the Abraham Lincoln claim soon. Good ore has been discovered on this property.

OREGON.

BAKER COUNTY.

Lack & Schmitz of Baker City, agents for the Sampson G. M. Co., have bought from A. W. Ellis & Co. the Venture, Risk, Mikado and Sampson claims, which are situated in Cracker Creek district, near Baker. The claims transferred have been worked by a tunnel now in 315 feet on the ledge.

JACKSON COUNTY.

W. H. Jackson, C. Baker and J. H. Ray of Medford have located twenty cinnabar claims between Elk and Trail creeks. Where discovery was made the ledge is said to be 50 feet wide, and its length, as far as the locality has been prospected, is from a quarter to half a mile. The ledge matter is very heavy with quicksilver. Men are now at work making excavations and running a tunnel. The mine is about 27 miles from Medford.

The Smith Bros., of Grants Pass, have bought of McDonald & Ray the bond they held on the Hawkeye mine, owned by E. Ray of Gold Hill. Cox & Lyman made a good stake out of it when it was first discovered. E. Ray later took out at different times several thousand dollars; then the sellers of the bond made a small strike in the beginning of the present winter. The shaft is now down 200 feet and the mine is considered better than at any time before.

JOSEPHINE COUNTY.

H. M. White is developing the Black-

well quartz mine, recently bought by him in the Humbug district, near Grants Pass. The quartz carries good values in free gold. A mill has been bought and will be installed soon.

The Crystal Spring M. Co. of Grants Pass has been incorporated by H. A. Reed, C. C. Daniels and B. H. March; capital $20,000.

C. R. Paris of Santa Ana, Cal., has recently bought a group of placer claims on Whiskey creek, below Mt. Reuben, from G. Smith. The mine has a new ditch and a partial hydraulic equipment.

B. E. Meredith of the Wilson-Meredith mine on the Illinois, near Kirby, says the mine has been running most of the season with three giants. Considerable gold is being taken out.

The Lucky Queen mine on Jump-off-Joe, near Grants Pass, owned by Corliss & Rush, has been sold by Mackay & Crane, who have been developing it, to A. A. Durphy of Spokane, Wash. This mine is an old property, worked many years ago and abandoned. The new owner will equip it with machinery.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Hidden Fortune M. Co., whose property adjoins the Homestake, at Lead, S. D., are to erect a 250-stamp mill, with cyanide plant capacity of 250 tons of pulp daily.

UTAH.

BEAVER COUNTY.

Sixty-five per cent copper ore is reported found on the 400 level of the O. K. mine, near Frisco. This is the present lowest working. The strike is a seam of red oxide of copper.

BOX ELDER COUNTY.

The Copper Verd M. Co. of Salt Lake City is preparing to start mining in the Newfoundland mountains. The Southern Pacific cutoff, on the proposed route, comes close to the company's claims. Otherwise it would be necessary to haul the ore 25 miles to Terrace, which will not pay. The claims of the Copper Verd Co. have not been developed, but the croppings on one—the Commonweal—assay from 18% to 24% copper, 10 to 12 ounces silver and $2.80 to $3.65 gold.

JUAB COUNTY.

The Mammoth M. Co. at Tintic proposes to install a cyanide plant to treat the low-grade gold-bearing ores now blocked out between the 1500 and 2000-foot levels, and is having tests made to determine the adaptability of the process to the ore.

PIUTE COUNTY.

The capacity of its present mill plant being outgrown, the Annie Laurie M. Co. of Gold mountain has decided to erect a second mill, contemplating an expenditure of about $100,000.

Supt. Gibbs of the Park G. M. Co.'s mine, near Marysvale, says a fine quality of quartz has been struck in the 80-foot level, the vein being 10 feet wide.

SALT LAKE COUNTY.

To provide the most economic transportation for ore between the mines and smelter of the United States M. Co., an aerial tramway is planned. Bids have been invited for the contract by Robert Holden, the company's managing director. The plans decided upon provide for a daily capacity for transporting 1000 tons. The main line will extend over 2 miles and the Old Jordan branch will be 4500 feet. It is expected to reduce the cost of transporting the ore to about 8 cents a ton.

In the York M. Co. mine at Bingham a 10-inch streak of clean galena has been found in a vein 6 feet wide.

SUMMIT COUNTY.

A. H. Mayne has leased and bonded on the Parry group of claims at Park City, and has three men at work cutting a station at the 400-foot mark in the old tunnel. From this station the purpose is to both sink and raise. Work will be kept going all winter.

TOOELE COUNTY.

The Utah C. & G. M. Co. has been incorporated at Salt Lake City, capital $500,000, with J. T. Hammond president and D. R. Hammond secretary and treasurer. The company owns the North Greenhack group of claims and a lease and bond on the Lone Jack, Isabella, American Eagle, Mountain Chief, Anaconda, Black Hawk, Anderson and Nettie Nos. 1 and 2, situated on the east side of Skull valley.

WASHINGTON.

FERRY COUNTY.

J. W. Palmer has bought the Oregonian claim at Republic from J. A. Bauer and H. L. Neville. The ore runs from $1.55 to $8.64 per ton. Mr. Palmer will sink a shaft 100 feet deep, which he thinks will tap the vein.

OKANOGAN COUNTY.

J. B. Chapman, secretary and treasurer of the Wauconda G. M. Co. at Wauconda, states that the tunnel has been driven 1060 feet by two shifts which are making an average of 5 feet per day. No other work, he says, will be carried on until the Rossman mill is ready to receive ore. Experiments have demonstrated that the Wauconda ore can be concentrated, and the capacity of the mill will be made 100 tons daily. An order has been placed for machinery and the mill building is being remodeled to make room for it.

WYOMING.

ALBANY COUNTY.

The Florence mine, originally opened in 1876, and from which a large amount of gold was taken, is to be worked again. The mine is now owned by the Florence M. & M. Co., of which C. H. Marsh of Pueblo, Colo., is secretary and M. N. Grant manager.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—The Board of Trade has made a very strong protest against the conduct of the Department of Mines at Victoria.

Good reports continue from copper claims at south end of Atlin lake. Gibbs & Lavediere have a crosscut in 140 feet and no hanging wall reached. The ore in sight is reported to go 6% to 24% copper. Many free-milling gold properties are being opened up.

The Momo Mountain quartz mill is crushing.

As there will be a large reduction in freight rates this year on the White Pass & Yukon Railway, several additional hydraulic plants will be installed; also, one large dredging plant.

Atlin, Jan. 28.

The Christopher hydraulic leases on McKee creek at Atlin are reported to have been sold to a company represented by W. I. Scott of New York for $68,000, $20,000 of which is payable March 1. The property consists of seven hydraulic claims and one dredging lease, together with a water right of 900 inches. Work has to be commenced by May 1.

New placer fields are reported to have been discovered on Peace river, north of the Carlhoo gold district, by J. H. Reed, a prospector. Reed says he has found ground that averages $35 per day per man on the surface.

The construction and operation of a smelter on Barkley sound, on the west coast of Vancouver island, is said to be projected by the Pacific Steel Co., of which H. H. Swaney is the head. At present the company operates the Irondale smelter, near Port Townsend, Wash., and the West Coast properties supply ore to it.

The Crow's Nest Coal Co. has reduced the price of coke to large consumers from $4.50 to $4 per ton. The Canadian Pacific Railway, it is reported, has reduced the cost of transporting coke from Fernie to Nelson 25 cents per ton and from Fernie to Grand Forks and Greenwood 50 cents per ton. Owing to these reductions, the cost of coke has been cut 75 cents per ton to the Nelson smelter and $1 per ton to the Boundary plants. The Canadian Pacific has also made a reduction of 25 and 50 cents a ton on coal hauled from Fernie to Nelson and from Fernie to Boundary points, respectively.

The Snow Shoe and No. 7 mines, near Phœnix, are now shipping. Ore sent out of Boundary mines for the week ending 14th inst. amounted to 8124 tons. Total Boundary shipments for the year to date amount to 41,916 tons. The two Boundary smelters treated 7934 tons of ore in same period, making a total for 1902 of 42,344 tons.

IVORY COAST.

A report from Assinio, on the French Ivory Coast, says that a reef of gold-bearing quartz 8 feet wide and panning from two to eight ounces has been opened up on the Ivory Coast.

RHODESIA.

From North Rhodesia the British Chartered South Africa Co. has received news of the discovery of a copper field estimated at 40 square miles. The field is situated 150 miles north of Victoria falls and runs thence to the Congo Free State. In the ancient mines dug by the natives, and reopened by engineers in the employ of the Chartered Co., assays of 44% are now being secured, besides a large percentage of silver. The Cape-to-Cairo Railway will be diverted to pass through the copper fields. Work on this section of the road has been accelerated, and it is expected that it will be completed early in 1903.

NEW SOUTH WALES.

The semi-annual report of the Broken Hill Proprietary Co. for the six months ending Nov. 30, 1901, shows the total output of silver to be 2,683,946 ounces fine, against 3,009,164 ounces for the previous half year, the price realized being 1 3/4d per ounce less; while the lead produced was 30,457 tons, against 27,869 tons, returning an average of 31s 11d per ton decrease on the prices obtained for the previous period. A reduction of 2s a ton in costs of ore treatment is announced, offsetting part of the loss by lowered sale price. The gross profit for the half year amounts to £56,293 1s 4d, which, after deducting £12,974 12s 7d for depreciation upon the various plants, leaves a net profit of £43,318 8s 9d. The sum of £34,243 10s 10d has been expended in construction. One dividend (131st) of 1s per share, amounting to £48,000, has been distributed.

Personal.

F. G. SEMMEK, of Salmon City, Idaho, is in Chicago, Ill.

J. L. BUTLER of Tonopah, Nev., is sojourning in San Francisco.

W. SWARTZ is manager of Santa Cruz M. Co. at Patagonia, Ariz.

J. S. SMITH is Supt. of the Jerome Canyon Copper Co. at Jerome, Ariz.

C. P. GRIFFIN has removed from Torres, Mexico, to Washington, D. C.

HENRY BRATNOBER of London and New York is in San Francisco, Cal.

W. J. RATTLE is superintending the Grand Mogul mine and mill at Silverton, Colo.

V. BARND, manager of the Tybo M. & Red. Co., of Tybo, Nev., is in Boston, Mass.

G. E. METZ, M. E., of Brooklyn, N. Y., is examining mines in Madison county, Mont.

E. MCCORMICK has been appointed manager Aberdeen Copper Co., at Lordsburg, N. M.

A. D. FOOTE of the North Star mine has returned from San Francisco to Grass Valley, Cal.

GEORGE MCGILLIVRAY, of Dawson, Yukon Ter., is sojourning at Weaverville, Trinity Co.

W. BIELEFELDT has been appointed Supt. Green Mountain M. & M. Co., at Silverton, Colo.

H. DORN of Cleveland, O., has been appointed Supt. Woodland M. Co., at Red River, N. M.

S. OSBORNE, of Frisco, Utah, has been appointed Supt. of the Horn Silver mine at that place.

C. KING of Kokomo, Colo., has been appointed foreman Juniata mine, near Breckenridge, Colo.

HARRY A. LEE, Colorado Commissioner of Mines, has returned to Denver from Charleston, S. C.

FRANK JANNEY has resigned the superintendency of the Con. Mercur gold mines at Mercur, Utah.

R. MITCHELL is in charge of the smelters at the Cananea copper mine at La Cananea, Sonora, Mexico.

C. K. MCCORNICK, O. P. POSEY AND W. H. BREVOORT of Salt Lake City, Utah, are in Paris, France.

J. W. DEANE, late of Aspen, Colo., is superintending for the Valley Leasing & Mining Co. at Leadville, Colo.

C. M. FUELLER, Denver, Colo., has gone to Mogollon, N. M., to make plans for a pneumatic cyanide plant.

F. M. FIELD is putting in a 30-ton cyanide plant at Virginia City, Mont., to treat the tailings from the Easton mine.

A. H. HAWKES, assistant Supt. Conrey M. Co., at Virginia City, Mont., has returned there from a trip to Boston, Mass.

G. Z. EDWARDS has been appointed Supt. and H. W. Fox foreman of the mill at the Con. Mercur G. M., Mercur, Utah.

CHARLES J. BUSH, assistant Western manager Canton Steel Co., Denver, Colo., is making a business trip through Arizona.

P. ESPINAUX, manager of the Ralston Divide mine near Michigan Bluffs, Cal., has returned to the mine from a sojourn in San Francisco, Cal.

A. B. RINGELING of Baker City, Or., has been appointed mill Supt. and J. Fletcher of Butte, Mont., foreman Royal mine, near Philipsburg, Mont.

J. P. EVANS, of the Colorado Iron Works, Denver, Colo., is at Picacho, Cal., directing the construction of the milling plant for the California King G. M. Co.

W. J. THOMPSON, who has been connected for some years with the Oriental Con. M. Co. in Korea, has returned on a visit to his home in Plumas county, Cal.

C. L. LANG has resigned the superintendency of the Mack mine at Big Oak Flat, Cal., and has accepted the same position with the Hazel Dell M. Co., near Sonora, Cal.

R. NAYLOR, of Salt Lake City, Utah, has gone to Peru to join the engineering staff attached to the Cerro del Pasco copper mines, now being exploited by American capital.

A. C. ELLIS is in San Francisco, Cal., as counsel for J. R. DeLamar in the contest before the Circuit Court of Appeals, involving zinc dust as a precipitant in the cyanide process.

A. H. MAYNE has returned to Park City, Utah, from an inspection of the zinc smelters at Iola, Kan. He says experiments are being made there to save the gold and silver in Western zinc ores.

EDWIN REYNOLDS continues the chief engineer of the Allis-Chalmers Co. In addition to his present position of assistant chief engineer, Irving H. Reynolds is appointed general superintendent of the Milwaukee, Wis., works.

C. T. DURELL has been appointed general manager Central Montana Mines Co., which is at present operating the Whiskey Gulch and Spotted Horse properties in Fergus county, Mont. Mr. Durell was formerly Supt. Spotted Horse mine.

G. NISBET, formerly of Oroville, Cal., returned to San Francisco, Cal., from Siberia, where he has been engaged for several years with the Exploration Co. of Northeastern Siberia, Ltd., in an unsuccessful exploration for gold-bearing beach sands similar to those at Nome, Alaska.

PRINCE KOUSNETZOFF of the Royal School of Mines in St. Petersburg is in Placer and Nevada counties, Cal., making a tour of the mines for the purpose of studying the quartz and placer mining methods and machinery used, for the purpose of reporting on them to the Russian Government.

Commercial Paragraphs.

THE Stirling Co. has about finished erecting 500 H. P. of Stirling boilers for the Shannon Copper Co., Clifton, Arizona.

THE Allis-Chalmers Co. are building a 60-stamp mill for the Tom Boy G. M. Co., in Savage Basin, near Telluride, Colo. The new plant will be next to and adjoining the old mill.

GEORGE ANTON is manufacturer of Star and Globe brands of miners' and drivers' lamps, at Monongahela City, Pa., and guarantees to supply the trade with "the best lamp yet offered."

DON PALMER, of San Jose, Cal., connected with the King Solomon mine, Calaveras county, took one and one-half tons of talcose ore to Denver, Colo., on which tests were made with pneumatic cyanide treatment by C. M. Fueller.

THE Board of Council of Columbiana, Ohio, recently through its fire committee decided to discard the common hose couplings and use instead the improved couplers known as the "Quick as Wink," made by the W. J. Clark Co. of Salem, Ohio.

MANAGER W. VAN R. WHITALL of Gilbert, Wilkes & Co., Coronado Bldg., Denver, Colo., reports the recent sale of a 600 K. W. Bullock generator and three cars of Wagner transformers; also, a 40 H. P. motor and other equipment to operate new perfecting presses of the Denver Post.

A DEVICE for holding in check quicksands in mines has been invented by L. P. Friestadt, 145 La Salle St., Chicago, Ill. The invention consists of plates of steel, grooved and made to join, each section fitting rigidly in the other and built up from bedrock to form a barrier to quicksand. The invention is called a quicksand shield.

A. M. SWAN, sales manager of the Henry S. Mould Co., Pittsburg, Pa., manufacturers of briquetting machinery, has returned there from a business trip lasting seven months, during which time he visited every smelter on the North American continent. His trip covered the United States, British Columbia and Mexico. Many of the large smelters are already using briquetting presses made in Pittsburg, and many orders were secured from other smelting interests who had not in the past made use of such machinery.

THE Goodman Manufacturing Co. of Chicago, Ill., manufacturers for the past thirteen years of a complete line of electrical mining machinery for use in bituminous mines, have recently associated with them, as mining engineer, S. W. Farnham of St. Louis, Mo., for many years engineer of the Missouri Pacific Railroad coal properties in Missouri, Kansas, Arkansas and the Indian Territory. Mr. Farnham has a wide experience in the development, equipment, organization and management of bituminous mines, and is prepared to advise and assist the customers of the Goodman Co., not only in matters pertaining to electrical equipment, but as well in those relating to ventilation, drainage, tipple equipments, etc.

MINING AND SCIENTIFIC PRESS.

Whole No. 2171.—VOLUME LXXXIV. Number 9. SAN FRANCISCO, SATURDAY, MARCH 1, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

State Mining Exhibits at the St. Louis Exposition.

World's fairs and national expositions do not lose their novelty by repetition, and a change of location centering the new fair in a fresh environment of population makes the advertising opportunities of the latest as desirable as those of the first one were. Western mining industry has been represented by exceedingly fine exhibits at each of the great expositions that have been held so far. The opportunity afforded by the St. Louis Exposition, the preparations for which are well under way, should not be passed by and neglected. All States should have at it a better exhibit even than they had at the other expositions. Undoubtedly all will improve on the exhibits they have made at the preceding fairs, and no State should retire behind the other in accomplishment.

The St. Louis Exposition is too near at hand to wait on the initiative of an appropriation by Legislatures, which may not meet till next January. It is possible to regard this as an advantage. A legislative appropriation always has a string of appropriators attached to it. It is regretable that the admission has to be made that the appropriators have in notable instances been the principal exhibit obtained by the expenditure of any State appropriation.

Whatever is done in the way of an exhibit of the metal mining industry, if it would be well and creditably done, must be done through the initiative of private enterprise, and there must be no delay in starting the preparatory work for it. At the best the time is short, and several months delay in starting would make satisfactory preparation practically impossible.

As to California, this is a matter in which the California State Miners' Association, by its proper officers, could very appropriately take the initiative. Some organization, authority and responsibility are essential. The Miners' Association has this scaffolding already set up for any legitimate service to the mining industry. Some of the officers have had experience with exhibition work that would be invaluable as assistance in guiding the paid staff of employes who must do the real work of getting up and installing the exhibit.

There is, it would seem, an opportunity for improvement in the plan and detail over preceding State mining exhibits. To begin with, there should be a definite expression of just what the exhibit was expected to accomplish for the industry—not glittering generalities, that sound well, but can not be fixed down at a particular point into a measure of dollars, but definitely declared purposes, which, accomplished, mean dollars of gain for the investment in the advertisement. Having formulated this initial declaration of definite, concrete purpose, plan the exhibit to its accomplishment along the shortest and most direct line. Eliminate and keep out anything that does not clearly contribute to it. At expositions people gather ideas by the eye. The mass of facts and ideas provided for consideration is appalling to the mind. It refuses to be selective under such a strain. The eye is always selective at expositions. Build, then, the exhibit for the eye, so that the eye shall grasp its purpose definitely, and, by all means, avoid the possibility of confusing the selective power of the eye.

A mere collection of specimens of minerals and of rocks is confusing to the eye of an exposition visitor in the direct ratio of its completeness and usefulness as a mere collection of minerals. A collection of machines in all the glory of polish, paint and stillness defies the eye of an exposition visitor to make a selective effort. Both spread over much floor space, are great, magnificent, incomprehensible and—deserted for the Midway.

Throw the mineral specimens and rocks together at one end of an operating machinery plant—built, if you please, of many of the separate machines—from the other end of which a stream of bright, shining gold is falling, and the eye of the exposition visitor is at once selective and sees, not the many species of minerals, nor the points of the engines, but an opportunity to get a stream of shining gold. The minerals are raw materials, the machines a means to a definite desired purpose, both are details; the essential thing the eye selects is that together they make an opportunity to get gold.

The visitor to the exposition wants to see opportunities to get gold. All gold mining offers such opportunities. Let the mining exhibit then show the opportunities and do not let it show anything else. Our owners of undeveloped mines want to sell them, our manufacturers of machinery want them developed so that they become a market for their products, the railroads want more people everywhere. They can all unite to pay for and make a business exhibition of the opportunities in metal mining for more people than now have them.

All concerned who take this affair up should do it as business, and, regardless of providing opportunities for a bread-and-butter brigade, put the management in the hands of men, big enough in mind to make the most out of the opportunity.

A Clean-Up of the Golden Horseshoe Mill, Kalgoorlie, West Australia.—(See Page 117).

A PROPOSITION for the establishment of a U. S. branch mint at Manila, P. I., is reported to have behind it the powerful interest of the American S. & R. Co. The report is very probably correct. The establishment of a branch mint there is bound to add to the consuming market for silver. It was proposed and strongly advocated by this journal a year ago as a practical measure for assisting the silver mining industry. It would be entirely self-supporting from the start, and there should be no delay by Congress in providing for its establishment.

SOME ONE has been at the mental effort of comparing some totals of sale value of the metal production of the United States, as stated by the statisticians of the U. S. Geologic Survey for 1900, and has discovered that "gold's prestige is declining" and "metals not called precious are much more in demand." The discovery would be interesting if the fact were true. As it happens, the fact is not true. If such comparisons could be considered logical, and if the use of the word "prestige" were proper in such connection, quite the reverse would be true. Mining for gold is more and more becoming a preference among people who mine for profit. Silver, copper and lead are all produced as an incident to the mining of gold. That is to say, the gold in the ore, and not the other metals, is the inducement to mine. More and more are such mines being sought for. The first question of a proposed silver, copper or lead mining proposition is always, How much gold is there in the ore? Properly giving to gold a credit for the values of silver, copper, lead, zinc and even iron produced incident to the gold mining and crediting, the values of the other metals with the gold production of mines that would be mined for the other metals irrespective of the gold, and generally rearranging the produced values to the economic basis of the mines making the production, it will be found that the demand for gold production is far in the lead as the incentive to mining. Copper will follow gold and silver make a poor third. Statistics read by total figures alone are very frequently misleading. The real teaching of this form of knowledge can only be had when the original details are studied together with the totals. The fact of economic importance deducible from the statistics of metal production seems to have so far been totally overlooked. It is that the production of gold is now tending to lower the sale price of silver, copper, lead and zinc by increasing their production independent of the extent of demand. To consumers of these metals, therefore, the condition of the gold mining industry is a matter of importance, and its extension a positive benefit. All such comparisons as are implied by such phrases as "gold's prestige now declining" are absurd. As well might one say the importance of the blood in the human body becomes less as the solid tissues increase in mass.

Doing Things and Telling.

A bright mining engineer, who is in direct charge of several extensive mining enterprises, said, in response to a suggestion from the writer, that he make public some of the special kinds of practice that his experience and necessities had originated: "These special inventions or kinds of practice have cost me something and they are worth something. I know they are to me, and they may be to others similarly situated. Making knowledge of them public I am giving something that has value for nothing, and by making the knowledge common with my competitors I am making it less valuable to me. It seems to me unbusinesslike to follow your suggestion." The position of the speaker seems reasonable, yet it is certainly debatable if it really be the correct position, and in the writer's opinion it is not.

There are many bright minds at work on mining and metallurgical problems. What one finds can not in the nature of things remain long an individual possession. Another or others with a similar problem find the same thing—it may be at the same time, or it may be a little later—some one of the finders publishes the knowledge, for to all it is unlikely to have the same value. The one who tells, gets prestige—a something more substantial than mere recognition that a success gives. Prestige in mining or metallurgy has a commercial value. It is capital for the man who does and tells so others can do. It widens his field of activities by making known to more men his possession of one capability from which others always infer more capabilities.

Assuming that what one does in telling the new fact that becomes known to him, all others do; then the one who makes the common possession of all, his one new fact, receives in return the many new facts, which are the result of the cumulative work of all others, and which the one mind working alone would only gain laboriously, or perhaps never gain at all.

The one who gives must then gain in the giving, something not possessed before—prestige—and as well what all give to the common stock of ideas. This is the gain from doing and telling. Does the loss of temporary exclusive possession of the idea outweigh such a gain? The writer thinks it does not.

An English engineer who had the prestige which doing and telling had given him, in addressing a body of American engineers, expressed this same view. He said, "You American engineers, soon as you find something new that improves your art and cheapens your practice, tell the others, so that you are all, always working ahead from the same advanced foundation. It is the cause of the great success your nation has achieved in industry. You all work together as parts of the intelligence of one man."

ON another page I. S. Hallett of Silverton, Colo., in a paper written for this journal, gives the results of some original investigations in the lately developed branch of metallurgical science known as concentration. Mr. Hallett is in this line of work a specialist, and his data of experiments and the conclusions he draws from them should receive careful consideration from miners and millmen. It must also not be overlooked that the conclusions from the experimental work have been verified by his commercial practice. Concentration of valuable minerals from worthless gangue rocks, and the parting of minerals one from the other (making each after the parting commercially utilizable where before parting none or at the best only one was commercially utilizable), is, as stated above, a lately developed branch of the science of metallurgy. It is quite a different art from the ore dressing practice in which it originated. The latter provided many mechanical devices and appliances for which the later developed science is showing the preferable application to service. Mr. Hallett's investigations, for example, have not developed a new device, but have only proven a more efficient mode of use of an existing one. Incidentally, there has been more clearly defined the economic limits of use of other mechanical devices for concentration.

Mine Water Problem of Cripple Creek, Colo.

Cripple Creek district, Colo., mine operators are becoming convinced that they have a condition of mine operation that is countering their efforts to obtain absolute economy of operation. As their mine openings have of necessity been getting deeper, the mine waters have been rising into them in increasing quantity. Machinery and methods have been improved, and costs lowered by the improvements, but the condition of constantly increasing quantities of water and increasing heights of lift have been adding costs that, if they have not already, ultimately will take up all the other savings. In short, the mine operators find their economies have been with the spigot of the barrel and that the bunghole is open.

Other mining districts have had problems of mine drainage that individual mines have found too much for their resources. Ultimately they have solved the problem at the common cost or by collective action. Cripple Creek's mine drainage problem does not differ in its essential features from the mine drainage problems of the other districts. There is reason to believe, however, that a much more satisfactory and economical solution is possible of its particular problem than has been accomplished heretofore with the similar problem in other districts.

A scheme of drainage to provide for the mines of the district will require one or more main tunnels with many branches. It is known that the tunnels can be constructed at a rapid rate by well proven methods. It can be closely estimated in advance what the cost will be. There is no question but that the mines can pay this cost as it is incurred. The equitable apportionment of the cost to all the mines in proportion to the service that will be given by the construction can be made approximately in advance, and the correction of errors of estimation developed by construction can be provided for. It is suggested that the approximate volume of rock in the claims between the plane of the drain tunnel and the surface would be one element on which apportionment of cost could be based, and the time interval between beginning of construction and completing of it through the particular claim would be the other element.

The drainage scheme should not be made an investment for profit. Such an organization should be made of the mines for this special purpose that the flat cost of construction could be assumed by the several mines and written off in as a debit to the profit and loss account as being dead work construction. The use of the drain tunnels for ore transportation could be made by contract to pay a charge in proportion to that use which would be distributed to all the mines in the pro rata of the original cost of construction, and would be a credit against that cost. The benefit of mine transportation facilities afforded by drain tunnels is in the direct ratio of use made of them.

These lines are intended to be suggestive without being conclusive. The opportunity for the application of the essence of the community of interest idea is exceptional. Gold mining is not competitive. The interests served by the community of interest in draining Cripple Creek mines will always remain unaffected by metal market prices and trade combinations. The necessity and profit of a common drainage requires no demonstration. The fact that it will, if postponed now, be done ultimately, should operate against its postponement.

The beginning of a great work of this kind must be in an ascertainment of the facts. There would be nothing lost and very much would be gained if the operators of Cripple Creek mines should make a preliminary organization and provide the cost of such an ascertainment of facts, and with them the most perfect drainage project that can be devised. The cost of this, while in the aggregate a considerable sum, so divided will be a trifle to each mine or group. The mere doing of it would suggest such an added stability and permanence to the mines of Cripple Creek district that their market values would be raised. Better than this, it would bring the accomplishment of drainage nearer, by eliminating the uncertainties and indefiniteness incident to the absence of exact knowledge of the facts and the real figures.

Concentrates.

IT takes about one pound of coal to evaporate one gallon of water.

A TANK 16 feet in diameter and 12 feet high will contain 13,500 gallons.

ORE is a natural mineral compound that is commercially valuable, containing metal.

AIR adiabatically compressed to 600 pounds pressure would have a temperature of 1070° F.

THE weight of water in pounds that a 1-foot length of pipe will hold can be obtained by squaring the diameter of the pipe in inches and dividing by 3.

THE highest altitude ever attained by man was reached by Dr. Berson of Berlin, in a balloon, Aug. 1, 1901—33,500 feet. The thermometer recorded 40° F. below zero.

IN 1800 the price of lead in London was £21 1s 3d per ton. The highest price of lead in London during the nineteenth century was £35 15s in 1806; the lowest, £9 11s 6d in 1894.

GOLD DREDGING on the Snake river deposits has been done at costs as low as 5 cents a cubic yard. It is quite probable that some short runs have been made at costs below that figure.

IN the case of a dynamo a single belt will transmit approximately 1 H. P. for each inch in width when running at a speed of 1000 feet per minute. In calculating for speed allow 1% for slipping.

A DAM lower down upon a stream cannot retard the water in the tailrace of another dam higher up the stream, if the back water of the lower dam does not reach into the tailrace of the upper dam.

THE general rock formations of the free gold-bearing zone of Thunder mountain, Idaho, are said to be rhyolite, andesite and quartz porphyry, the largest, heaviest and most regular bodies being rhyolite and quartz porphyry.

TIN-LINED AND LEAD-LINED WROUGHT-IRON PIPE is made by pouring the melted tin or lead into the iron pipe. The makers say that the result is a union of the two metals that is not broken apart even when the pipe is bent.

ONE pound of charcoal heats seventy-three pounds of water from 32° F. to 212° F. One pound of anthracite coal heats seventy pounds of water in the same way, and one pound of dry wood heats thirty-five pounds of water the same.

AN advantage of a high speed engine over a low speed is the obtaining of a desired amount of work from a less size and weight of engine. A disadvantage with some uses is a loss of power in the gearing required to reduce the speed.

TO FIND the quantity of water elevated in one minute by a pump the piston speed of which is 100 feet per minute, square the diameter in inches of the water cylinder and multiply by 4, the product in the number of gallons per minute.

WHETHER 45% or 60% giant powder is best to use is determined largely by the ground. A 6-foot hole is average, though 8 and even 10-foot holes are sometimes drilled. A 6-foot hole will ordinarily take about ten sticks of giant.

POTASSIUM or sodium will take fire when dropped into water, and will hurn in the water. Potassium costs about $1.50 per ounce; sodium about 30 cents per ounce. Both chemicals are dangerous, and should be handled with extreme caution.

IN a water tube boiler there is 10 to 12 square feet of heating surface to one H. P. With a tubular boiler the allowance of heating surface is from 14 to 18 square feet to one H. P. The former is ahout 10% more economical and makes steam about twice as fast.

"COMMERCIAL RUBBER" is by no means pure. For instance, the "rubber" of which carriage tires are made is composed of 48.5% pure rubber, 5 4% .sulphur, 6.7% barytes, 7.6% litharge, 20.7% chalk, 9.1% talc and 2% lampblack. Zinc white is a usual adulterant.

A LARGE DEPOSIT of ore that assays show carries an average gold content sufficient, if recovered, to pay more than mining costs, without counting values in other metals, is always worth the cost of study and examination to determine if the ore can be commercially reduced.

IN New South Wales, Australia, the wages paid for skilled machinists average $10.84 per week; for electroplate finishers, $15 84; for coppersmiths, $15.60; for engineers, $15.84, and for brass moulders in the engineering trades (bench hands), $10.56; coppersmiths, $12.48, and engineers, $13.32.

AS to whether the outside rim of a wheel goes faster than the hub, the question is to he interpreted hy the meaning given the word "goes." If motion through the air is meant the rim of the wheel "goes" faster, as it has the same total forward motion as the hub and, additionally, a motion of rotation.

FOR the separation of lead from manganese, a solution containing about 0.2 gram of lead in 150 c.c. and not more than 0.03 gram of Mn, with 25 to 27 c.c. of nitric acid of specific gravity 1.42, is electrolyzed at 70° C. with a current of two amperes. The lead is completely precipitated as dioxide, free from manganese, in thirty-five to forty minutes. With larger quantities of Mn, fairly accurate results are obtained by adding 35 c.c. of nitric acid and a little oxalic acid to dissolve any precipitate of manganese dioxide, using a current of two and one-half amperes.

THE slopes for an earth reservoir dam should not be less than 2½ horizontal to 1 vertical, and it is preferable to have the water facing slope as much as 3 or 3½ horizontal to 1 vertical. A clay core made thick and compacted by ramming will prevent the starting of leaks and is to be preferred to sheet piling.

THE auriferous conglomerates of the Witwatersrand at Transvaal, South Africa, are practically composed of quartz, silicate of aluminum, iron pyrites, gold and silver. Copper is rarely met with, as also are arsenic and antimony, and this composition is the explanation of the great success of the cyanide process with these ores.

ROASTED SULPHURETS, where the sulphurets were pyrite, might be made the basis of a cheap paint. It would be necessary to grind them after the roasting, wash, and settle from the wash water the finer slimes. These slimes, after drying, could be mixed with a cheap grade of fish oil to make protective paint for rough wood work.

USUALLY in the case of a reservoir the accumulation of water in the reservoir while rising in the waste way is an element of safety to the dam, as it may delay the time of high water until its maximum flow is past; but when the stream continues for some hours at its maximum flow, the overflow of the earthwork is delayed, but not prevented.

IT is good mining practice to drift on a vein as far as the pay ore shoot is continuous. It may be good practice to drift on a vein where there is no pay ore but heading toward where a pay shoot is believed to exist. Such a question can only be decided at the mine by one skilled in the business of mining. A street opinion on it is worth what it costs.

TO CONVEY 480 cubic feet of free air per minute 3 miles to have a delivery pressure of 100 pounds per square inch would require a 4-inch pipe and the loss in pressure would be 10 to 12 pounds, which would require the initial pressure of compression to be from 110 to 112 pounds. In losing 10% in pressure a gain in volume is made and the actual loss of power is reduced to 3½% or 4%.

MINING and scientific progress therein can be greatly advanced by the intelligent fraternity of miners in furnishing individual ideas and experiences as contributions to the common stock of knowledge, and in no way can greater publicity be assured than by their appearance herein. "Everybody is wiser than anybody," and one's light is none the less for having aided in illuminating another's path.

MAGNESIA ORE is not a definite description. Assuming that magnesite, magnesium carbonate, is referred to, this mineral being common in California, the crude ore is used as a refractory furnace lining; and ground, it is used in paper making. The mineral mined in California has a limited local consumption. The supply that could be mined, if there was a considerable use of it, is practically unlimited.

IN the hand labor tools used in mining, the best grade of steel, the quality that makes the fewest trips to the blacksmith, is the cheapest. The aggregate cost of the labor and material used in keeping such tools in perfect working service is several times the first cost of the tools. A saving of 50% in the blacksmith work on them during their life is always a larger sum than a 50% addition to the first cost.

NATIVE COPPER occurs in a rhyolite tuff in the foothills on the western base of Mount Rainier, Pierce Co., Wash. The metal occurs in pieces the size of pin heads and in flakes. It is disseminated through the rock and shows freely on fracture surfaces. The percentage is small, but the quantity of the deposit is said to be large and easily mined. No sulphide or other minerals exist in the matrix of the copper.

ONE TON OF COAL is approximately equal for steam making purposes to four barrels of petroleum. No exact figure of equivalence can be given, as both coals and petroleums vary in efficiency. The approximate figures stated are based on both high-grade coal and high-grade petroleum. A ton of inferior coal might only equal three barrels of oil. In California the average coal and the average petroleum are equivalents in the ratio of 1 coal to 3.5 oil.

IN welding copper, the copper should be treated with potassium nitrate and a cyanide, after which it is welded to itself, or to iron or steel, in the same way that iron is welded in the ordinary forge shop. A clean fire of coke or charcoal and a temperature of the copper considerably below a white heat ensure the best results. A temperature above this makes the metal brittle in working, while one much below will not give sufficient fluidity to the flux.

A SIDE HILL DITCH is best constructed in two stages. First the grade of the top of the ditch is leveled off and the inside hank slope completed. Powder can he used to advantage in this. A row of holes is drilled down to the level of the grade and from 12 to 18 inches in front of where the inside hank slope will be. These are loaded so that on blasting the broken rocks and earth shall be thrown off of the grade. The grade is then completed with scrapers and pick and shovel work. After the grade is completed the ditch cut is made in it. Powder is here used carefully to avoid injuring the outside solid bank. Unless the material should be compact rock, plows and scrapers can be used to economize on the more costly pick and shovel work.

AT Freiberg in Saxony, the fumes from the ore roasting furnaces are conducted through a series of rooms or fume chambers to a mountain top 1000 feet or so above the works. Much of the valuable flume dust settles by gravity and hy condensation. In one of the chambers a spray falls through the gases purifying them of many acid gases. Notable amounts of arsenic and silver are recovered. Very little gold seems to be taken into the fumes from the furnaces.

IT IS STATED that the Pennsylvania courts have decided that land could not be taxed as oil land until a producing well had been opened. The suit was over taxes on a piece of land adjacent to an oil well, and which taxes were refused. The court held that the assessor could not look into the ground any farther than the ordinary mortal and therefore could not say whether or not there was oil underground. The principle of this doctrine would apply to a mine equally with oil wells.

A MAN can work out and shovel into a sluice box from 5 to 10 cubic yards of wet gravel a day. In practice the greater ease in working the gravel wet rather than dry is balanced by the greater weight handled. The height of the sluice box above the shoveling floor affects the quantity that a man can handle. A wheeled scraper, with two horses, will move an average distance of 75 feet about 150 cubic yards of gravel loosened by a plow daily. A wheeled scraper does cheaper work than a drag scraper, particularly in gravel.

THE effective head of a water power is the total fall or head of the water, measured from the surface of the water in the penstock to the center of the tip opening of the nozzle through which the water is discharged on the huckets of the water wheel, less the sum of the heads due to friction and other resistances to the flow of the water through the pipe and other conduits to the point of application. The effective head of a water power is that part of the total head which does useful work. It is the head that gives the velocity to the water jet.

THE Supreme Court of Arizona in Kinney vs. Fleming decided that in the location of a mining claim, a mine in the vicinity, mentioned by name in the location notice, will serve as the "permanent monument" required hy the statute, which states that the notice of location shall refer to some permanent monument to identify it, and also ruled that a location notice stating that "said claim is 1500 feet in length and we claim 300 feet on each side of the center of the discovery shaft for the full length of the claim," is sufficient to hold said claim.

THERE is no average duty to water in hydraulicking. The number of cubic yards moved to the inch deponds on so many special conditions that it may be only 1 cubic yard in twenty-four hours, or it may be 25 cubic yards in the same time. Top wash that contains little or no gold is washed with the least quantity of water that will move it. Bottom gravel that contains gold is given all the water required to thoroughly disintegrate it so that the gold settles out of it. Averaging conditions, estimates can be made for duty of the water anywhere from 2 cubic yards to 5 cubic yards to the inch.

THE difference of pressure of water in a power pipe line, between the pressure with no water discharging through the nozzle, and the pressure with water discharging through it, measures the loss of head by pipe friction and any other causes creating losses. To get the number of feet of head lost, divide the number of pounds difference of pressure by .434. The small pipes leading from the nozzle to the pressure gauge should so connect with it that no suction effect is created which would tend to reduce the pressure in the gauge, and the latter should be set at the exact height of the point in the pipe or nozzle at which it is required to determine the loss of pressure.

IN platting the strike lines of several veins to determine a possible intersection or junction, the line of strike must not be confused with the apex line. If a vein has other than a vertical dip the line of strike and the apex line will not coincide in direction on a hill slope. Too much must not be inferred from the projection of several strike lines showing a possible joining beyond the lines of exposed outcrops. They may not intersect, and if they do there is no reason for assuming that they will make a thicker or richer ore body. Where soil and float conceal outcrops of veins the use of water to ground-sluice the covering down to the bedrock is a cheap and efficient method of prospecting.

IN treating ore hy the cyanide process the cost of the chemicals consumed per ton of ore treated depends on the kind of ore it is, varying from 5 cents per ton on siliceous ore carrying free gold to $2 50 per ton on sulphides requiring fine crushing and slow leaching. So, too, the cost of handling depends upon the amount handled. To crush, fill and discharge will vary from 50 cents per ton in a large mill handling free-milling gold ore to $3 per ton in smaller mills handling harder material. It is impossihle to give other than approximate statement. One kind of ore going $2.50 per ton can be treated profitahly, while a different ore might assay $7 per ton and yet not give resultant profit of any kind when treated. As to the cost of plant, the first cost of a good 100-ton cyanide plant would approximate $60,000, though it could he made to cost $100,000.

Screen vs. Hydraulic Sizing.

Written for the MINING AND SCIENTIFIC PRESS by S. I. HALLETT.

Perhaps no branch of metallurgical science has increased with greater strides during the past ten or fifteen years than the art of concentration; the art of eliminating the heavier, less valuable constituents of the ore from the lesser, more valuable and heavier contents; the placing of the ores, owing to their peculiar situation and distance from the market, in shape by means of dressing, so as to secure a profit to the mine producing them.

The discovery of the stratifying table, the many types of which have been all evolved from the Rittinger table, placing the ore directly before the eyes of the operator in such shape that but little skill was required to attend to them, has been, perhaps, the greatest stride in the past ten years. This invention, perhaps, has done more to make the modern concentrating mill fool-proof than any other of late years.

Beyond all douht, the question of sizing, if not the most important, ranks second to the invention of these stratifying tables. The necessity of sizing the ore is so absolute that it is now denied by but very few people, and we will find, in traveling and examining mills, that the more exact the sizing is the more perfect is the concentration in every respect, both in the making of a cleaner concentrate and tailings with less valuahle material in them.

Heretofore the common practice has heen to use trommels, circular in shape and revolving for the coarser sizes; then, as the ore decreases in size, to classify the pulp by means of hydraulic apparatus, the principle of which has always been practically the same—that of allowing the pulp to drop through an ascending current of clear water and drawing the pulp off at various heights by means of syphons. Of course, the larger pieces, being the heavier, drop to the bottom, flowing off in one syphon, the next heavier being drawn off above these, etc.

It does not matter whether, as in the German meinecke, you draw off from three to five sizes with the one introduction of clear water, or, as in the different types of cone sizers, you draw off one size at a time, running the overflow to another cone, though this type is more objectionable than the meinecke, hecause of the continued introduction of clear water. It is easy to get water into pulp but very hard to get it out without losing values.

In all well regulated mills the overflow of the hydraulic classifiers is discharged into a spitzkasten or series of pointed hoxes, being drawn off from the bottom, the heavier settling first and the last heing the finest. Great losses are made with the spitzkasten in its discharge, it carrying the infinitely small particles of mineral in suspension. The greatest loss connected with a modern mill lies at the end of the spitzkasten—a loss that is highly accentuated by certain classes of crushing machinery and lessened by others.

The use of stamps in concentration tends to flour the softer mineral and put it in a state where it will take several hours for it to settle, which, of course, removes it from the chances of being caught upon any concentrating machine. The use of rolls lessens this tendency towards sliming, hut does not eliminate it.

Human ingenuity has never been ahle to thoroughly and ahsolutely settle the losses that arise from the overflow of the spitzkasten, though considerable of these losses may possibly be taken up by some scheme like that of the Elmore patent process for running these tailings through crude oil, that seems to catch the finer ore particles very much more than the harder quartz.

But I think that the problem down to the spitzkasten has been solved—that is to say that, by means of vibrating screens, the use of the classifier may he entirely eliminated from now on in concentrating mills. The mill recently built at Silverton belonging to the Silver Lake mines is thoroughly equipped with shaking screens from the coarsest size down to and including screens of 100 mesh. They are working in a perfectly satisfactory manner and entirely do away with hydraulic classification.

It is understood that 100 mesh means 10,000 holes to the square inch. It is of the finest kind of wire cloth. Material that will pass through it is finer than is usually used hy assayers in preparing ore for the furnace. It is understood, of course, that it is not desired in any instance to comminute the ore so finely; but it is well understood that, in grinding the bulk of the ore down to a satisfactory size, a certain proportion, in spite of all efforts, will be floured, and it is just as necessary that this finest product should be sized in order to do good work as it is on the larger sizes. Hydraulic sizing is not sizing—it is classification.

The laws governing bodies falling in still water are well understood, but the law governing bodies in an upward current of water under pressure can never he understood, because of varying currents and eddies that are inseparable from its use.

A general objection to this style of sizing or classification comes under the head, however, that very small bodies of ore will fall to the same plane, so far as syphons are concerned, as the larger bodies of rock of less specific gravity. By running this same ore over a screen, supposing the screen to do good work, this factor is eliminated, as the action of the screen is positive, and pieces must be of the same size in order to pass through the meshes. The fact that a piece of ore and a piece of rock are of practically and almost absolutely the same size renders their separation upon almost any kind of a table more easy and satisfactory.

The main objections to a sizing scheme in the past have heen: First, the clogging up of the screen; second, the life of the screen, and, third, its capacity. These, I can thoroughly and absolutely say, have been eliminated. While, as yet, it is not a perfect machine, it is infinitely superior to hydraulic classification in its results.

I do not care to go into the merits of the different screens on the market, as most of them, while perfectly fitted for dry work, are entirely unfit for wet

work; but the principle that must he followed to insure success is the one that can he tested hy any one who has a fine screen and will place rock upon it, and that is that if a screen be moved at any angle and the screen be stopped suddenly hy any kind of a hump, the ore lying on the screen will follow the direction from which the hlow is given, and that, in order to keep the screen meshes clear, the hlow must be delivered at a point so as to drive the ore from the screen upwards. In other words, the screen having heen stopped, the momentum of the ore will go towards the direction of the hlow. This can easily he tested hy placing the screen at an angle and striking it, when the effect can he ohserved. As in the old humping table, it can be made to climh up grade hy striking it at the tack. By making the screen strike at its end, a forward motion is imparted, but this will ahsolutely clog the machine to a very great extent, and is not the blow that is desired.

The hlow that I am using is delivered at an angle of 45° to the pitch of the screen, giving it an upward and forward bump at one and the same time.

This machine is being used equally well on dry work of the coarsest material, as well as on ore down to the size of 100 mesh. It does its work perfectly and can he seen at any time in the Animas mill helonging to the Silver Lake mines, at Silverton, Colo.

The wear of the wire cloth will undoubtedly he excessive, but I am assured hy the manufacturers that they can manufacture brass perforated down to 100 mesh, which will solve all questions as to the wear of the screen cloth.

One curious fact in connection with this extremely fine sizing is that the capacity of the screen is regulated hy its width and not by its length.

There are many screens upon the market—the Jeffrey screen, the screen now heing put upon the market hy the Colorado Iron Works of Denver and many others—each and all of them having some good points.

I enclose a statement of some experiments that are not yet complete—one giving a tahle of my experiments with shaking screens operated with differential motion, another of the same screen operated hy eccentrics. I regret that my tests of the latest screen introduced into our mill, which is actuated on the principle of the bumping tahle, which seems to he superior to others, are not yet finished.

In these tests I have tried the following way:

According to test No. 1, ore that has passed through a 16-mesh screen and stopped on a 20-mesh screen has the percentage marked hy the per cent. I have then gone further and tried the material that would pass through this 20-mesh screen and, hy hand work, have further tested its efficiency on a 30-mesh screen, and the table likewise gives the efficiency in the percentage of result that will stay upon a 30-mesh screen, together with the inclination of each foot of the screen, the revolutions per minute of the motive power, the length of the stroke and with or without spray.

The product passing through the 100-mesh screen is fed directly to a spitzenkasten and is eminently suited to it.

EL COPETE, URES DISTRICT.

El Copete Camp and Smelter, Ures, Sonora, Mexico.

The El Copete mines, in Ures, District of Sonora, Mexico, were worked in the seventeenth and eighteenth centuries hy the Spaniards, who sought only the gold in the ores, paying little if any attention to the copper. They followed the rich gold-hearing streaks in the ore hodies, leaving hlocked out in the mines thousands of tons of rock which were very rich in copper. By modern methods of reduction those ores left in the mine are also worked for hoth the gold and copper. The "antiguas," as the old Spanish workers are called in Mexico, sorted on the dumps the ore they extracted, taking only the richer, and leaving on the dumps thousands of tons of ore which are workahle now at a profit.

The operation of these mines hy the Spaniards was ahandoned at the time of the great Apache uprising, in the heginning of the nineteenth century. In 1881 they were taken up and worked for their gold hy J. J. Hardwick. In 1896 Mr. Hardwick and some associates of Phœnix, Arizona, and New York organized the Copete and Melczer Mining Companies, to work the mines on a more extensive scale for hoth gold and copper. A copper smelting furnace, with a daily capacity of 250 tons of ore, was huilt and started into operation May 6, 1901. A concentrator, it is stated, is to he added to the plant.

El Copete is situated ahout 25 miles eastward from Carho station, on the Sonora railway, and the Melczer Mining Co. has a concession from the Mexican Government to huild a line of railway connecting the camp with the railroad at Carho.

The Copete M. Co., an American corporation, is the operating company, holding the stock of the other corporation, in which the titles are vested. The officers are: W. Melczer of Nogales, president; W. S. Logan of New York, vice-president; and J. J. Hardwick of Phœnix, general manager.

COPPER SMELTING FURNACE, EL COPETE.

Operations of Arizona Copper Co., Clifton, Ariz.*

[STAFF CORRESPONDENCE.]

Within the last eight months the old smelter of the Arizona Copper Co., Clifton, Ariz., has heen supplanted hy an entirely new plant, with the most modern facilities for work. The new plant has four rectangular furnaces, each 20 feet by 3 feet 3 inches, water-jacketed, and each with a 50-foot stack leading into the dust chamber, 60x30 feet in size. The latter opens into a tunnel 480 feet long, on a 2% grade, into the mountain, to the hase of a shaft that rises vertically 380 feet to the surface. Each furnace has a capacity to handle 250 tons charge per day. The molten material discharges from the furnaces into square settlers, is thence conveyed to reverheratory furnace, thence to 5-ton ladle, from which it is carried by the electric crane to the converters. The slag skimmed off the converters goes to the charge again as a flux. There are ten converters, three heing in use at a time. The charge is made up of sulphides, oxides, carbonates, flue dust, concentrates and hessemer slags. The plant includes three concentrating plants at Clifton and one at Longfellow, near the mine of that name, by which ahout 27,000 tons of ore are concentrated every month, ahout 5000 tons heing smelted crude. The milling process is one of concentration and reconcentration. The carhonate ores of low grade are concentrated separate from the sulphides and the tailings from the former are suhjected to the leaching process, the plant for which includes acid works. The tailings from sulphide ores are reconcentrated, then smelted. The company has two mining centers, one at Longfellow, the other at Metcalf. About 70% of the ore tonnage comes from the former and 30% from the latter group. The most of the sulphides come from the Longfellow. Manager James Colquhoun states that the property is producing ahout 13,000 tons of copper per annum, and that the ores run ahout 4% copper. Operations here are systematized to handle a large tonnage at the minimum cost and to make the closest possible saving of values. The company's railroad, operating between Clifton and Metcalf, is now 36-inch gauge and hauls the ore to the smelter at a very low cost per ton. It will soon be hauling the ore of the Shannon Copper Co. also. The Arizona & New Mexico Railroad, from Clifton to Lordsburg, is virtually a part of the property of the Arizona Copper Co. It has heen made standard gauge and gives excellent train service. The same line is being extended from Lordsburg to a point on the El Paso & Southwestern.

*See illustration on front page.

THE following quotation is taken from a recent work of the director of the psychological laboratory at Yale University: "Although a frog jumps readily enough when put in warm water, yet a frog can be hoiled without a movement, if the water is heated slowly enough. In one experiment the water was

heated at the rate of .0036 of a degree Fahrenheit per second; the frog never moved and at the end of two and one-half hours was found dead. He had evidently been boiled without noticing it." At any point of time the temperature of water was in such little contrast with the temperature a moment before that the attention of the frog was never attracted to the temperature of the water at all; so the frog was actually boiled to death without knowing it.

The Treatment of Clay Slimes by the Cyanide Process and Agitation.*

NUMBER III.

By E. A. H. Tays and F. A. Schiertz.

Lime.—Half an hour before stopping the agitation 5 pounds of slacked lime was added per ton of slimes in the charge. Many tests were made with amounts varying from 2 to 15 pounds per ton, but we finally settled on 5 pounds as a safe mean. That the addition of lime is necessary to produce settling will be seen later. That it affected the solutions by vitiating our titrations has been shown. We fully demonstrated that, whether the lime was added at the beginning or near the end of the agitation, it made no difference in the settling.

In the old treatment of the sands so much trouble was given by foul solutions that every few months the solution on hand had to be thrown away. We were never bothered in this way throughout the whole run of eleven months on slimes, and we attributed this result to the use of lime, which undoubtedly slimes can be obtained with a charge not exceeding promoted settling and neutralized the acidity of the slimes.

Settling.—After the charge had been agitated five hours it was allowed to settle seven hours. In this part of the process we made many experiments and were kept continually on the alert in order to obtain the best results, since upon good settling depended the whole success of the treatment. Our aim was to secure a settling that would allow us to decant at least 70% of the solution perfectly clear. We found lime absolutely necessary with charges that were proportioned at less than 4 solution to 1 slimes. A charge consisting of 10 tons of slimes and 20 tons of solution to which lime was not added had not settled 1 inch at the end of two hours. A large sample of this charge was taken after agitation had been started, and experimented upon by the addition of water. When the proportion of 1 slimes to 4 water was reached settling was rapid. Acting on this hint, we made the charge 1 slimes to 3 solution and added 7.5 pounds lime per ton of slimes. This, after agitating one hour, was allowed to settle, with the following results: In one hour it had settled 5 inches; in two hours, 10 inches; in three hours, 12 inches; in four hours, 13 inches; in five hours, 13.5 inches; in six hours, 14 inches; in seven hours, 15.5 inches, and in eight hours, 16 inches.

In practice it would tax any plant to handle the volume of liquid that 1 to 4 would produce, which, with the "wash," would be nearly 6 tons of solution for every ton of slimes treated, but with the judicious use of lime as good settling as can be got from clay 3 solution to 1 slimes. But 25% of sand slimes in the charge would make a great difference. Material of that character should not need more than 2.5 solution to 1 of slimes.

We found that the pure clay slimes charge at 1 to 2 would not settle even when 20 pounds of lime to the ton of slimes had been added, but when the charge was made 1 slimes to 3 solution the settling was rapid. As has been stated, our regular charge, where we used a mixture containing not more than 75% of clay, was 1 slimes to 2.8 solution, although at times we had to raise this to 1 slimes to 3.4 solution, even when lime was used. Even when the clay slimes settled it was not very rapidly. In the seven hours allowed they would only settle 17 inches, whereas the clay slimes (70% clay) would settle from 22 to 24 inches in the same time. At the former rate of settling but 81% of the values actually held in solution could be decanted (two decantations, as will be seen, being made from each charge), while the latter rate gave 91% decanted—a difference to be appreciated.

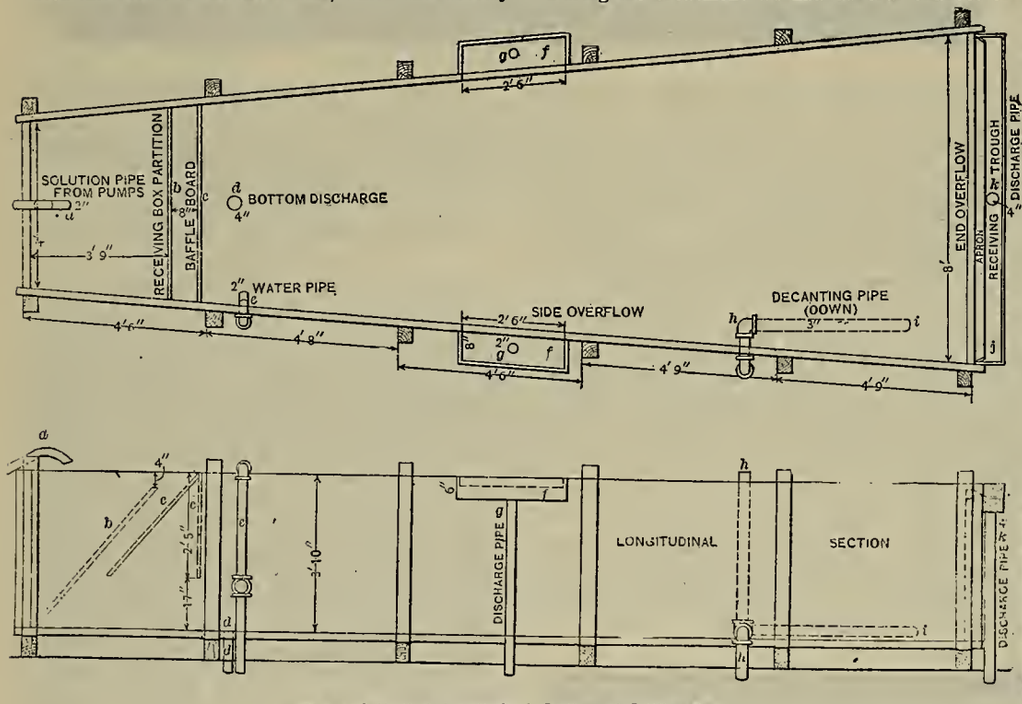
During the greater part of the run, when we had our average character of material, the charges would deposit as much as 12 inches during the first hour. These charges would begin settling from the moment the agitators were stopped, often settling 0.25 inch by the time the charge ceased going around.

During the last three months of the run a charge would rarely settle over 6 inches during the first hour, and often not more than 4 inches. Even at this slow rate the settling would reach 19 inches, as a rule, inside of the seven hours allowed.

The records of settlings from tests made at different times may be of interest (see Table V).

During the treatment we had several chances of testing the settling rate for thirty consecutive hours.

The difference will be noted in the rate of settling in the different tanks at the same time:



Plan and Vertical Longitudinal Section of Settling Box.

TABLE V.—Tests of Settling With Lime.

Test made April 18, 1900—Charge: 1 slimes to 2.5 solution. Slimes, 10 tons; 15 pounds of lime to 1 ton slimes added as soon as charge was in.

Settling	
Hours.	Inches.
0.5	3.75
1	5.5
2	10
3	15
4	18
4.5	19

Decanted clear, 62.5%.

Test made April 21, 1900—Charge: 1 slimes to 3 solution. Slimes, 5 tons; 20 pounds of lime added per ton of slimes.

Settling	
Hours.	Inches.
1	5
2	10
3	12
4	13
5	13.5
6	14
7	15.5
8	16

Decanted clear, 85.33%.

TABLE VI.—Rate of Settling in Different Tanks.

(Test made Marcb 1, 1901—Charges Nos. 1022 to 1026. First settling 31 hours, second settling 6 hours.)

Tank No.	First Settling. Inches.	Second Settling. Inches.
1	29.50	24.50
2	20.00	24.00
3	20.00	25.30
4	28.50	23.00
5	25.50	22.50
Average	28.99	23.59

Total extraction of values held in solution by two decantations, 91.6%. Ordinary decantation at the time, 86.3%.

This run was on our most favorable material—that containing at least 25% of sand slimes, and the charge was made up of 10.878 tons of slimes and 27.158 tons of 0.15% KCy solution, making the proportion 1 slimes (wet) to 2.5 solution, or (moisture being 17.6%) 1 slimes (dry) to 3.25 solution. In the first settling 5 pounds of lime per ton of slimes was added, and in the second 2.5 pounds per ton. Unfortunately, the test sheet was lost, but the second settling shows that the first had deposited at least 24 inches in the seven hours usually allowed.

TABLE VII.—Rate of Settling in Periods of Three Hours.

(Test made May 2, 1901—Tanks settled for 30 hours, rate taken every 3 hours; material of the worst clay, nearly all clay slimes containing, in the driest and hottest month in the year, 19 2% moisture, after having lain exposed for 5 years. Charge, 1 slimes (dry) to 3.3 of 0.15% KCy solution. Lime added, 5 pounds per ton of slimes.)

Hrs.	Tank 1 In.	Tank 2 In.	Tank 3 In.	Tank 4 In.	Tank 5 In.	Tank 6 In.
3	11	12	10.5	7	6	7.6
6	16.5	16	17	16	15.5	10
9	29.5	19.75	19	14.75(?)	15.25	12.5
12	22	18(?)	19	20	16.25	13.5
15	24	20	19	19(?)	19	15
18	24	22	23	21.5	19.5	15
21	23.5(?)	22	23	21.75	19 5	15.5
24	23.5	22.5	23	21.75	20	15.5
27	24.5	22.5	24	21.5	22.5	16
30	24.5	24.5	24.5	23	23.5	18

At seven hours tank No. 1 had settled 19 inches. Tank No. 2 had but two-thirds the regular charge. In decanting tanks settled 0.5 inch more.

Table VIII represents our worst work. Considering the material, the wonder is that it could be made to settle at all, with a reasonable proportion of solution.

TABLE VIII.—Rate of Settling for Thirty Hours for Each Hour.

(Test made June 27, 1901)

Hrs.	No. 1. In.	No. 2. In.	No. 3. In.	No. 4. In.	No. 5. In.	No. 6. In.

29	25	26.5	28	25	26.5	17
30	25	26	28	25.5	27	17

These charges consisted of at least 80% pure clay and were made up of 1 slimes (wet) to 2 87 solution. The slime charge was 9.914 metric tons (1000 kilos) containing 16 9% moisture. This would reduce the dry metric tonnage to 8.238 (9 tons avoirdupois), which would make the charge 1 slimes (dry) to 3 6 solution. Even at these proportions the nature of the material was such that settling was very poor, barely 50% of the solution being decanted clear after seven hours' settling, with the addition of 5 pounds of lime per ton of slimes.

Decantation.—After settling seven hours the clear solution (from 14 to 18 tons) was decanted. This usually took about an hour and twenty-five minutes. At first we drew off the clear solution through a double row of 3-inch holes set in "criss-cross" order for about 3 feet up the side of the tank, but by reason of the irregular settling we soon found that this would not do, since we often had to leave a couple of tons or more of clear solution in the tank. At the suggestion of our machinist we then ran through the side of each settler, about 1 foot from the bottom, a 4-inch pipe, connected it by a loose elbow at the inside end with a 3.5-foot length of pipe, set out of reach of the arms, and kept vertical while the charge was in agitation. After settling had taken place the standpipe was let down gradually into the clear solution, until this was decanted down to the slimes. The 4-inch pipes from all the settlers discharged into a receiving tank set on the floor below the agitator level. While 80% of the solution would run off very rapidly, the last portion (say 3 or 4 tons) drained off very slowly, and with it would come more or less fine slimes, which subsequently made trouble in the zinc boxes—not by hindering precipitation, but by the increasing bulk of the precipitates and interfering with their reduction to bullion. To overcome this difficulty we put over the two gold storage tanks a large settling box, which will

Trans. American Institute Mining Engineers, Mexican meeting, November, 1901.

be described in its place. (See illustration.) From the receiving tanks the solution was pumped up to this settling box, whence it ran to the gold solution storage tanks, and thence to the zinc boxes.

When all the clear solution from the first charge had been decanted, water was charged (agitation having been started again) in equal amount to the solution decanted, and the agitation was continued one hour, or for about fifteen minutes after the wash water had been charged. We used water mostly as a wash, but when we had an excess of weak solution (that which had been through the zinc boxes) we used it as a wash or second solution. As soon as the wash was charged 2.5 pounds of lime per ton of slimes was added. This was not needed in all charges, but to make sure it was added, as it could do no harm. After agitating one hour, as stated, the charge was allowed to settle six hours, when the clear solution, usually in amount equal to the first decantation, was decanted in the manner already described.

Water was then added to the charge, in solution, until it was thin enough to run, when it was discharged through a 4-inch opening in the side.

(TO BE CONTINUED.)

The Story of the Nome Gold Fields.

Written for the MINING AND SCIENTIFIC PRESS by OTTO HALLA.

In calling your attention to the gold fields of Nome let me briefly give you the history of the gold fields. During the Klondike excitement in 1898 several expeditions started for Kotzebue sound, rumors among the whalers being to the effect that gold had been discovered and mined there by deserters from the crews. Among other vessels the bark Alaska sailed from San Francisco in June, 1898, with several scores of men—adventurers—bound for Kotzehue sound. Among the crew was an adventurous tailor, Erick Lindbloom of Berkeley, Cal., a Swede by birth, who, like many others at that time, had formed a determination to go to the Arctic gold fields at any cost. On the trip north the bark touched in Port Clarence harbor to take on a fresh supply of water. Lindbloom, who was not much of a sailor, went ashore to assist in getting the water and took the opportunity to desert. As soon as he came ashore he struck out for the hills and hid in the huts of some natives. Lindbloom did not show up until after the departure of the Alaska. Although he was apprehended by the revenue cutter Bear when he came to buy some provisions, he was soon liberated by her officers. This was in July of 1898. He visited the Swedish missions where Teller City now is, and then struck out on the creeks until he found some prospects. He then went to the mission on Golofnin bay and met a party of prospectors and several of his countrymen, among others Lofet Lindberg, a United States Government reindeer herder. The latter deserted his charge and with another Swede—John Brynteson, also a Government reindeer herder—joined Lindbloom, Missionary Anderson and a prospector named Price. Lindbloom confided his discovery to them and under the leadership of Price they started in Octoher, 1898, to stake the ground. They formed a mining district, elected a recorder and appropriated several claims on the creek, which they named Anvil creek. The news of the discovery soon spread out and the few people who were within a distance of 100 miles commenced to arrive. News of a gold strike travels fast and the report of the discovery was sent to the outside by the transportation and trading companies in St. Michael.

With the opening of navigation in June, 1899, a rush of people arrived from all parts of Alaska and also from the States. In June after the first day sluicing was done on Discovery claim and the amount of $9000 was taken from the boxes that day the magnitude of the discovery was appreciated. In July the beach diggings were struck. People with rockers could make from $15 to $200 per day, and in some instances even more. The town of Nome started into existence and by the closing of navigation in 1899 had grown to about 4000 population. Several new finds were made on Snow gulch, Glacier and Dexter creeks, Solomon river, Big Hurrah, Ophir creek, Elkhorn creek, Cripple river—all of which have proven to be paying properties. The output of gold dust in 1899 was calculated to have been $1,500,000.

On the opening of the season of 1900 a new discovery was made on the beach near Top Kock point. On a stretch of 200 feet square, within three weeks, about $500,000 worth of gold dust was taken out with rockers; finally the pay was traced to Daniels creek, which since has produced a large amount of gold dust. Anvil creek and other creeks were opened up on a larger scale, and it is estimated some 20,000 new arrivals came into the district. Litigation was started, which has retarded the progress of the country to a great extent. Mine owners became fearful of opening up their claims, owing to the dangers of litigation. The output of gold during the year 1900 was officially put at $5,500,000. The creeks producing were Anvil, Snow, Dexter, Daniels, Ophir and Salomon river and Nekkla gulch. In the fall of the year a new discovery was attracting some attention on Gold Run, a tributary of the Blue Horse and also the Kongrock. On the strength of this discovery a new town, Teller, was started in the Port Clarence harbor, and a little boom was enacted during the winter season of 1900-1901.

During the winter season of 1900-01 some prospecting was started on the hillsides and benches off Anvil creek, Bourhon creek, Newton and Nekkla gulches, which indicated that good pay and large returns would he derived from benches, which up to this time had not been taken into account. The fuel question was a great drawhack to more extensive prospecting during the season. There was not coal enough on hand to supply the demand of the town of Nome, in fact coal was selling at from $75 to $100 per ton; it was a prohihitory price for prospecting with a steam thawer. Nevertheless the results of the prospecting that was made was satisfactory. One claim on Newton gulch worked by three men in the winter season produced $45,000; one claim, the Mattie on Nekkla gulch, produced $65,000. Several claims on Bourhon creek yielded from $4000 to $12,000; a claim on Martin's creek $2000, being the work of one man. Benches on Ophir creek produced from $30,000 to $40,000, all winter work in a very severe winter, with a large amount of snow retarding all development work. The season of 1901 opened up very late, in fact not before the middle of July. During the summer season of 1901 the older claims were worked and a few new discoveries made, principally on benches. The Anvil creek henches were proven to he more extensive in auriferous gravels than the creek hed. On a hench on Dexter creek (the Sugar claim) a hody of pay gravel 70 feet deep has been uncovered. On Glacier creek the Mogolan claim has proven to be a rival in richness to Discovery claim of Anvil creek. It has been demonstrated hy the work of 1901 season that the largest auriferous gravel deposits are to he looked for in the old channels of ancient rivers, which have been covered up hy slides and are now crossed hy the present creeks and gulches. Late in the season two hig nuggets were found on Discovery hench of Anvil creek worth $1050 and $1750 respectively.

The closing of the season has stopped the work till the summer of 1902, hut there seems no doubt but that developments have hardly been hegun on the greater gold fields of Nome. The output for the season of 1901 was put officially at $4,500,000.

A numher of new large scale enterprises were started up during the fall month of 1901. A ditch 10 miles long has been completed to Snow gulch and Discovery claim on Glacier creek. Hydraulic machinery was installed hy Leland, Davidson & Bliss on Snow gulch and Glacier creek. A hig steam shovel at a cost of $100,000 was installed on Solomon river by the Colorado & Minnesota M. Co., and gravel in the ordinary river channel, which averaged $2.50 to $3 per cuhic yard, was worked. A new discovery was made during the fall of 1901 on Condel creek, a trihutary to the Keevalik, emptying into the Good Hope bay. The creek promises to he a paying proposition. Enough gold has been taken out from the stream to induce several storekeepers to open up trading posts at the new town of Deering at the mouth of Keevalik last fall.

With the heginning of the winter season of 1901-02 a wide activity was noticable. All of the old discarded steam hoilers which were brought in with the great rush were put into good condition and work was projected on several benches in the Nome district, Kougrock, Bluestone and Solomon river districts.

The insecurity of title and the undeveloped condition of the mining which tended to retard the investment of capital in the first few years have now been changed to conditions where titles are secure and successful developments made. There are now opportunities for investment in mining that at least equal what can be found anywhere in the world. Especially is this the case for investment in ditches and hydraulic machinery. Actual prospecting has demonstrated that 50% of all the trihutaries of Snake, Nome, Cripple, Solomon, Neukluk, Pilgrim, Smoot and Top Kock rivers carry auriferous gravel in more or less paying quantities, covering an area of about 1000 square miles, which it will require years to work out. Ditches, hydraulic plants and, in many instances, long flumes to dump the tailings are required. The rivers in the Nome gold fields are particularly adapted for extensive and profitahle hydraulic mining, for the reason that during the snow thaw or any rain storm the small creeks and gulches become full of water and torrential.

To form an idea of the extent of those rivers and the gold deposits, the dimensions of the principal ones will illustrate. The Snake river, with its hends and curves, is about 25 miles long, having auriferous gravel from the mouth of Gold Bottom to its inflow to the ocean. The Nome river is 35 miles long, with many paying creeks as its tributaries. At the head are the Dorothy, Clara, Cbristian, Sulphur and Hobson, forming very extensive bars, all of which have proven to he paying. Then at the lower part are Dexter, Buster, Extra Dry and Lost creeks as its trihutaries, known to he of great value. Oshorn creek has pay in many places, as far as prospecting demonstrates. The Solomon river, 20 miles long, has the hest paying bars discovered in the district; hesides, the benches helow Shovel creek are known to produce from $30 to $40 per shovel per day, sluicing. The Cassa de Pago river is ahout 40 miles long, with very good paying trihutaries—Willow, Ruby, Goose, Quartz, Banner, Spruce, Penelope and Canyon creeks—all of which have contrihuted towards the output of gold. The Neukluk river is about 40 miles long, and has trihutaries—Ophir, Elkhorn and Camp creeks—of which Ophir has hars. The Cripple river is 20 miles long and its tributaries are Hungry and Oregon creeks and Nugget gulch, all of which have been worked since 1900. On Hungry creek an old rocker and a silver coin were found huried under 6 feet of gravel, clearly indicating that that creek was worked many years ago. The Sinook river is 45 long, with many paying trihutaries. All of these rivers will have to be ultimately worked on an extensive scale, either hy hydraulic means or steam shovels. There is easily opportunity for twenty or more independent hydraulic mining companies. At present there are existing several ditches, the principal one heing that of Leland, Davidson & Bliss, from the head of Glacier creek to Snow gulch and Discovery claim on Glacier creek. This ditch carries ahout 300 inches of water, is 10 miles long, and was made at an expense of $1000 per mile. The operators made within two weeks after starting to work a net profit of $40,000 after paying all expenses and royalty to the claim owners. They have commenced work on an extension of the ditch to Hohson creek, 15 miles distant, will get at least 1000 inches of water and will be ahle to work all the trihutaries to Snake river. Another ditch was started at the mouth of Oshorn creek hy Snyder & Co. C. D. Lane has commenced a ditch at the head of Ophir creek. There is a ditch in course of construction from the Scooschihlock, to convey water to Daniels and El Dorado creeks, at an expense of at least $50,000. The steam shovel on Solomon river is the forerunner of three more to he installed at the same place. The average dirt handled is $2.50 to $3 per cuhic yard. There are two hucket dredgers in operation on Solomon river.

Inlet to Pipes from Head Boxes.

TO THE EDITOR:—A pipe should ordinarily he connected with the head box from which it is filled hy a cone-like taper section. This is not always necessary, as it appears from following reason: I suppose a pipe of diameter d and slope s, heginning at a depth h helow level of water in head hox. The velocity of water in the pipe v is given hy proper tahles for d and s, and is often very low.

On the other hand the height h produces a velocity head $v = \sqrt{2gh}$. If $v_1 = \frac{3}{4} v$, a cone is not necessary, and the pipe will be full. On the contrary, if the head of water is low in the hox, or if the level falls to ahout the pipe opening, the cone is necessary. At least the pipe opening must have the form of vena contracta, i. e., the pipe opening must he $\frac{3}{4}$ in area or 1.25 times diameter of the pipe, with length equal to $2\frac{1}{2}$ the diameter of opening. But in practice, this proportion is not sufficient. Supposing h the minimum height of water above the center of the opening, the corresponding velocity at entrance is $\sqrt{2gh}$, and this velocity must give the same amount of water as the normal velocity V stated hy tahles for the pipes. Compensation with the velocity must he made by the areas, and thence, A heing the area of inlet opening or D its diameter, a and d area and diameter for the pipe, we must have

$$\frac{A}{a} = \frac{D^2}{d^2} = \frac{v}{\sqrt{2gh}}$$

Length must be at least three times the diameter A.

R.

San Francisco, Feb. 17.

THE longest electric power transmission line is in California at the present time, in fact several of the longer power transmission lines are there. The Bay Counties Electric Power Co. delivering over its own transmission line, and that of another company which has not started its dynamos yet, is commercially using power 214 miles from the generating station. Distance does not seem to have added any technical difficulties to the common practice with shorter lines. It is already so ordinary an affair that only Eastern people continue to he impressed hy the engineering of it. It is quite probable that if the engineers who devised and constructed the transmission were asked to make another commercial transmission of power to twice the distance, say 400 miles, they would proceed to do it quite as a matter of course. The telegraphed information that Niagara power has been successfully transmitted and used 40 miles away, or that the Missouri river has been harnessed to wires and sent 65 miles to Butte, Mont., causes no astonishment here. Comparatively the achievements are less notable than those in California which long since ceased to he notable.

THE gold dredger mentioned in the illustrated description of the Robins helt conveyor at Oroville, Cal., in the issue of Feh. 8, 1902, was built by the Bucyrus Dredge Co., South Milwaukee, Wis.

Irrigation Canals.

The ditch that supplies mines is more often a sidehill excavation than an excavation in a level surface. The idea used in construction is to employ the steepest grade that the water will run on without cutting the sides and hottom of the cut, in order that for the quantity of water the ditch carries it shall have the least possihle cross-section area, which means the least quantity of excavation and lowest cost of construction. This is not always carried out into practice as it should he. Some miners who build the ditches often huild them in blind imitation of another ditch, without consideration as to what particular degree of economical construction is ohtained. Sidehill ditch excavation is costly as compared with excavation in a level, and the average harder and more compact character of the sidehill ground increases the difference of cost.

With ditches intended for irrigation, of which the illustrations herewith show the typical appearance and some characteristic structures, the principles guiding construction are almost the opposites of what are applied with the mining ditch. The flatter the grade, down to a grade that will give, say, 1.5 to 2 feet a second rate of flow, the more desirahle the grade is for an irrigating canal. It covers more land with the flat grade, and the flatness of the grade holds the water so that it has ample time to sink into the ground and serve the useful purpose for which it is employed. Irrigation ditches are huilt wide rather than deep. They can he made in very shallow cuts by using the excavated spoil to huild restraining walls to hold the flow. The cost of moving the material out of the cut is on the average much less than with sidehill ditches. Machine excavations can be used economically. Head works and gates are made more permanent and substantial in construction than with mining ditches. Water is expected to flow through them to make arid lands fruitful forever.

A Golden Horseshoe Mill Clean-Up*

The first casual glance at the illustration on the front page is likely to suggest that it is out of place in a mining journal. The piled up halls shown are, however, not oranges, hut halls of retorted amalgam—a clean-up of the mill of the Golden Horseshoe gold mine, near Kalgoorlie, West Australia. The mine is situated in what is called the "Golden Mile Circle" and is extremely productive, the monthly clean-ups going hetween 15,000 and 16,000 ounces. The ore is very high grade, and the output includes recovery directly in the mill hy amalgamation, and from the cyanide treatment of auriferous sulphides and tellurides.

*See illustration on front page.

Cochise County, Arizona.

[STAFF CORRESPONDENCE.]

The mine of the Great Western Copper M. Co. is on the northern slope of the Dragoon range, near the northern end, their locations covering a portion of a north and south helt, within a lime, porphyry and diorite formation. The ores comprise mainly copper carhonates in a lime and porphyry gangue. The richer shoots are usually at the contact between lime and diorite. The ore hodies are in the nature of deposits, rather than veins. The property is well developed hy means of a numher of shafts and a great deal of drifting in ore from the principal shaft, which is 325 feet deep. The ore shipments, within the last five years, are said to have aggregated the value of $250,000. The ores run from 10% to 40% copper and at present ahout 200 tons a month are shipped. At present depth the work is getting into a sulphide ore. They have here a gasoline hoist and a steam pump, the latter handling ahout 45,000 gallons of water per twenty-four hours. A force of forty men are employed. F. M. Knapp is superintendent and W. O. Ahhott assayer. The property is 27 miles south of Cochise station, the latter heing on the S. P. R. R.

In the same locality C. W. Blackhurn and hrother of Tombstone are developing a group of claims, wherein there is a good showing near the surface of chloride of silver in a lime gangue. Shipments of forty cars of ore have heen made from the group from workings within 40 feet of the surface.

Some distance northwest of this is the Barrett property, helonging to the King of Arizona M. Co. It is considerably developed through a tunnel and incline shaft, opening a ledge of copper ore. The property includes a 60-ton smelting furnace. K. Preston is at present in charge.

Gleeson, Feh. 17.

The Silver-Lead Mines Near Darwin, Inyo County, Cal.

Written for the MINING AND SCIENTIFIC PRESS by A. B. CHITTENDEN.

While there are many now deserted mining camps that have had a varied and interesting experience, it is douhtful if there are many that have grown, flourished and passed into a stage of decay, to wait for a new day and a possible new fame, as that of Darwin, in Inyo county, Cal.

The ruins of old smelting furnaces attract attention to the days, three decades gone, when the silver-lead mines to the east of that town were yielding their rich ore in great quantities. The evident desire of the men who had control of these mines at that time was a large monthly production, rather than a continuance of mining, as shown hy the manner in which the properties have heen gophered in the simple following of the streak of richest ore which would suddenly widen and yield a fortune quickly. Thus hut a part of the ore bodies which doubtless exist have heen opened, and in some of the others there is a considerahle quantity of lower grade ore which might he made to yield profits, especially if it were not for the policy of the railroad company in making high freight rates, which, coupled with the cost of unavoidahle teaming, make transportation a luxury that mining here can not afford.

But little work has heen done in comprehensive development, and as hut in one or two instances has outside capital hecome interested, little has heen done toward the exploitation and intelligent handling of ores already exposed.

Apparently, there are possihilities hoth in the old mines and the prospects of the region worth consideration. There are a numher of well-defined ledges running in all directions, the values existing largely in pockets. Pits and small shafts are quite common, and ahout each is some story of rich ore which was taken out when the hunch hecame exhausted. A ledge may contain a silver ore carrying hut a trace of lead; then again the conditions may he reversed, or minerals of both metals he present in quantity. Moisture having dried from the surface matter, its natural leaching action has not accomplished much concentration at any great depth from the surface.

The medium grade of ore from a few of these mines has been concentrated and prepared for shipment to smelters hy working in crude wooden jigs, necessi-

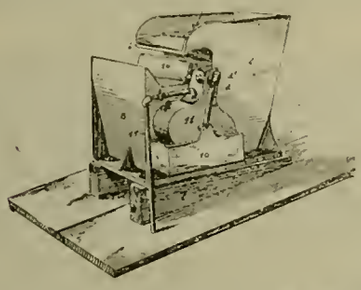
tating from five to ten minutes' work of a man on a few shovelfuls of the oxidized ore, and that coarsely crushed by hand, which operates against any clean separation of gangue from the ore. These mines have a little more than paid expenses by this method, which goes to show the possible profits to he obtained by a larger scale and more economical practice, especially if several mines were brought under one management.

Mining and Metallurgical Patents.

Patents Issued February 18, 1902.

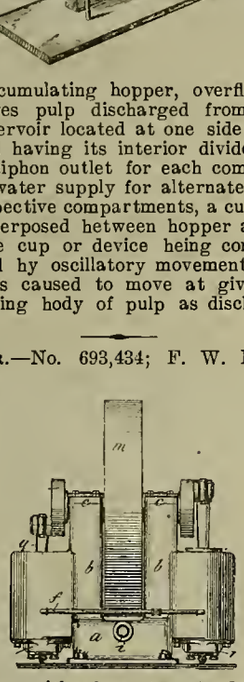
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ORE OR PULP SAMPLER.—No. 693,690; W. G. Dodd, San Francisco, Cal.



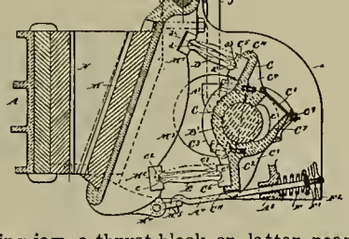
A pulp accumulating hopper, overflow chamber which receives pulp discharged from hopper, a swinging reservoir located at one side of overflow chamber and having its interior divided into compartments, siphon outlet for each compartment of reservoir, a water supply for alternately delivering water to respective compartments, a cup or collecting device interposed hetween hopper and overflow chamber, the cup or device heing connected with and actuated hy oscillatory movement of reservoir whereby it is caused to move at given intervals through flowing hody of pulp as discharged from hopper.

COMPRESSOR.—No. 693,434; F. W. Parsons, Elmira, N. Y.



A compressor with a hase, two standards uprising therefrom and having bearings at upper ends, and two vertical cylinders arranged one on outside of each standard; cylinders, standards and hase heing in one integral casting, a shaft mounted in standard hearings, a fly-wheel secured upon shaft and arranged hetween hearings, crank pins carried hy shaft and arranged one on outside of each standard, pistons in cylinders, connecting rods connecting crank pins with pistons, and an inlet and outlet for fluid acted upon in cylinders.

ROCK CRUSHER.—No. 693,580; W. R. Young, Brooklyn, N. Y.

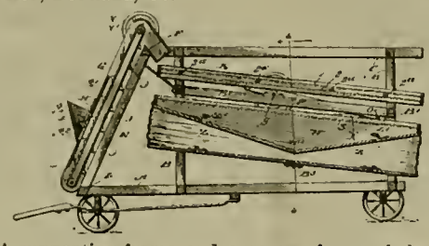


A swing jaw, a thrust hlock on latter near line of oscillation, a thrust hlock carried by jaw at a distance from first, a main shaft in rear of jaw, an eccentric block thereon having oppositely extending arms, and thrust plates extending from latter to thrust blocks, eccentric hlock mounted loosely on eccentric wherehy eccentric hlock may move relatively to eccentric as required in equalizing difference in lengths of arc described by thrust blocks.

METALLURGICAL PROCESS.—No. 693,482; E. G. Acheson, Buffalo, N. Y.

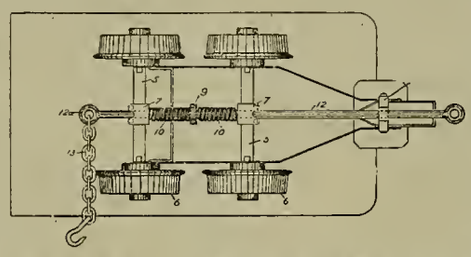
Reducing ores hy mixing pulverized ore with graphite as sole conducting and reducing agent, both in a dry state, coating particles of ore with graphite, and passing an electric current through mass of such coated particles, thereby heating to a point sufficient to effect reduction of ore.

ORE SEPARATING MACHINE.—No. 693,709; J. C. Hoefer, Portland, Or.



A supporting frame and a screen frame shakahly mounted on supporting frame; a second screen holding frame shakably mounted on supporting frame, independently of first screen frame, second frame having its hottom inclined downward from opposite ends, a hellows section W^2, under each inclined bottom portion, having valved blast discharges through hottom, sections W^2 W^2 having a hinged connection, and means for imparting a simultaneous shaking motion to screen frames, and comprising two hellows sections.

DRAW BAR FOR ORE CARS.—No. 693,810; G. E. Truax, Denver, Colo.



The axles and hoxes mounted thereon, draw har slidahle in boxes, stop on draw bar hetween axles, and a coil spring mounted on draw bar and interposed hetween stop and each hox, arrangement being such that car may be pulled hy applying power to either extremity of draw har.

Determination of Values From Sampling.

By S. G. DEWSNAP.

If the vein to he sampled should he of banded structure of which the different hands differ considerably in character and value, it is more accurate to sample each hand separately, and, if you wish to get at the total value of the whole, to make a calculation from the results ohtained from the different hands.

The following example of such a vein will make this method clear. A certain vein consists of four hands, as follows:

Six inches, value $23 per ton, gold and silver.

Twelve inches, value $7 per ton, gold and silver.

Twenty-two inches, value $3.40 per ton, gold and silver.

Eight inches, value $42.20 per ton, gold and silver.

To determine the total value of the whole taken together, multiply the number of inches in width hy its value and add together. Then divide hy the whole numher of inches, which will give the value of the cross-section in the case ahove.

6 × $23 00 =	$138 00
12 × $7 00 =	84 00
22 × $3 40 =	74 80
8 × $42 20 =	337 60
48	$634 40

$634.40 divided hy 48 will give $13.22 per ton value for the whole ledge.

This method requires some trouhle and more expense than hy crosscutting, but gives more information. In the case stated the manager secures sufficient knowledge to determine whether it will he more profitahle to take out and ship to the reduction works the whole vein or to assort it, shipping only the one or two streaks of greatest value.

A shaft may be sampled by crosscutting, the same as a tunnel. The more accurately and carefully the sampling is done the more concordant will the results obtained he. To determine the value of a dump of ore pieces may he taken from over the entire surface and two or more trenches may he cut through the ore on the dump, and these trenches sampled their entire length to the hottom, and the whole so obtained cracked and quartered until a sample is had, the same as for a tunnel or shaft or other mine working.

It is of the greatest importance to every mine to have a hook of sampling in which is recorded how and where each sample was taken. A good way is to number the samples at the mine and book accurately the details regarding that sample; its values as obtained from the assayer's certificate can he placed in another column. Then by reference the results of different samples may he checked up.—Republic, Wash., Pioneer-Miner.

The Ultimate Velocity of Gases.

Written for the MINING AND SCIENTIFIC PRESS by H. D. DIBBLE

The ultimate velocity, that is the complete or final velocity of gases under pressure into the atmosphere or vacuum, is a question on which the authorities seem to disagree to an extent that ofttimes completely baffles the practical engineer as well as the student in thermo-dynamics. Much that is inaccurate and untrue is printed on the suhject even in scientific papers.

The heat formula given below is offered as a partial solution at least of this complex problem. To find the ultimate velocity of steam it might he well to first find the velocity of air at the temperature and pressure of the steam, the velocity of steam would then be inversely as the square root of its density compared with that of the air. If the density of air he taken as 1 and that of steam at .6225, the square root of .6225 will be .7889, then if we divide the velocity of air by the decimal .7889 we will have the velocity of steam under the same conditions.

The question may he asked: Why not find the velocity of water under the pressure of the air, then multiply this by the square root of 815, air heing that much lighter than water; hut this rule will not work, to the dismay of many a student in physics; the reason is not hard to explain and will not he given here.

This question is not one of theoretical interest only, hut must soon become a practical, every-day question with the up-to-date engineer. The steam turhine is a machine that changes the kinetic energy of the steam at these velocities into work, and is even now the most efficient heat engine known.

By velocity I mean the complete ultimate velocity, the expansion heing allowed for. I have a large numher of tahles on the velocities of gases under pressure, including some of the very latest works on compressed air. They all give me the velocity of the gas at its compressed density, and state the rule "that if the compressed gas is flowing in to an ahsolute vacuum the velocity is the same for all pressures, he it one or one thousand pounds." When the compressed gas is flowing in to the atmosphere it can never have a velocity equal to that in a vacuum, let the pressure be what it may.

I can understand all of this and the reasons therefor, provided the gases are taken at their compressed density. All the works I have on the suhject gave the velocities without any reservations, and left me to infer at least that that was their complete velocities. How to get the complete velocities of these expanding gases was a prohlem that haffled me for a long time.

Finally it dawned upon me that the heat given up hy the expanding gas ought to just halance the kinetic energy of the jet. Acting on this suggestion, I saw by the tables that air under 132.3 pounds gauge pressure had a theoretical velocity 1275 feet per second. If the air had heen compressed in a compressor that was without friction and the jet received hy a turbine of 100% efficiency there would still he a loss of more than one-half.

Air at 60° F. (by the tahles) at 0 gauge pressure or 14.7 absolute flowing into a vacuum had a velocity of 1337.7 feet per second. By the process for the ultimate velocity, air at 60° F., expanding to a vacuum, gives up all its heat to the point of liquefaction, or say to 312° F. helow zero (probahly lower than in a vacuum, besides it may give up some of its latent heat, but this will suffice for our purpose); 372 then multiplied hy the specific heat of air, .2374, gives us 88.31 heat units × 772 gives us 68,175.3, the square root of this hy the square root of twice gravity gives as the ultimate velocity 2094 feet per second.

At the gauge pressure of 132.3 pounds per square inch, temperature 555° F., the velocity of flow into the air by the tahle is 1795 feet per second. By the heat formula, the loss of heat as air at the gauge pressure of 132.3 pounds per square inch, and then 555° F. expands to the atmosphere, is 495° F., and, by the rule given above, its ultimate velocity is 2414 feet.

If our rule is right, it will give us results to correspond with the rule that "the velocity of a gas at a given pressure will vary inversely as the square root of their densities." We will now try it on air compressed to the same pressure, but at different temperatures.

We will start at a temperature of 100° F. and compress to a pressure of 294 pounds per square inch in one case and from a temperature 0° F. to the same pressure in the other. In the first case we raise the temperature from 100° F. to 900° F., or 800° net, and in the other case we raise the temperature from 0° F. to 650° F. Without allowing the temperature to fall in either case we permit the compressed air to escape through their respective orifices. By the heat formula given above we get for the respective theoretical velocities 3,049.354 and 2,767.702. If we take air at 650° F. as 1 then the density of air at 900° F. will be .8260, and the square root of that is .9088, multiplying by 3,049.354 we get 2,771.252, which practically checks with the other result.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

TANANA.

The McLeane Trading & Development Co. has been incorporated at Spokane, Wash., to operate mines and other property in the Tanana district. It is capitalized at $50,000. A. G. McLeane is president, G. C. Menthorn secretary and treasurer and A. F. Raynor manager and superintendent.

ARIZONA.

COCHISE COUNTY.

A strike has been made in the Casey group of copper claims by P. J. Scanlan & Co. of Bisbee, who are operating there under a bond. The shaft is now down 45 feet in solid ore. Average assays show gold .51 ounce, silver 85.2 ounces, copper 10%, total value per ton $83.

P. Kirk and A. J. Pigeon of San Francisco have organized the Empire Smelting Co., and are now on the ground at Benson preparing plans of a custom smelting plant which the company will build there.

The Bisbee West Copper Co. of Bisbee has contracted for a pumping plant with a capacity of 100 gallons per minute. Supt. F. L. Dwight says that after the water supply is demonstrated to be permanent the water will be piped into Bisbee and sold. The company intends using oil in the future for fuel, a 700-gallon tank being now in course of construction at Don Luis.

The pump columns in the shaft of the Tombstone Con. Mines Co. at Tombstone are 15 inches in diameter and 22 feet in length. There will be four triple expansion station pumps with the necessary sinking pumps accompanying same, and the work of draining the lower levels will be accomplished by maintaining a capacity of 1700 to 1800 gallons per minute. It is expected that the pumps will be installed and in complete working order by July 1st. A new steel gallows frame 60 feet high and steel building frames will be erected at the shaft. A place for the 800 H. P. boilers is graded out and plans made for the hoisting engine itself, which is to be direct acting, with flat rope cable and capacity for 2500 feet. When the pumps are installed sinking will be resumed.

GRAHAM COUNTY.

J. Molder, Supt. of the Home Copper Co., near Clifton, says the company is considering the proposition of putting in an electric power plant. The company owns a spring with 800 feet available head. The spring is said to afford an abundance of water for the purpose desired.

E. U. Beauchamp, for the Polaris M. & M. Co., has bought the Polaris group of nineteen gold claims near Clifton. The purchase also includes a mill site on the San Francisco river and a 20-stamp gold mill at Evans' point, which will be remodeled.

MARICOPA COUNTY.

E. W. Fisher of Wickenburg has sold one of his properties near there for $8000 to the Bisbee Belle M. Co. of Los Angeles, Cal. Operations will be begun on the mine at once by the company, of which G. M. Cabe is president.

J. Boyd has made a strike in his mining claim 16 miles north of Phœnix at 130 feet down. A ledge 4½ feet wide, carrying $50 per ton in gold, has been encountered.

MOHAVE COUNTY.

The 200-ton concentrator of the Philadelphia & Arizona mine at Chloride is completed and ready for operation. C. N. Hassan has charge of the mill and A. M. MacDuffee the metallurgical department.

SANTA CRUZ COUNTY.

The Buena Vista M. Co., operating near Nogales, have installed an electric drill plant operated by a fine gasoline engine.

At the Pena Bianca mine, near Nogales, high-grade ore is now being stoped out and put upon the dump. It is the intention of Manager Hurst to sink the shaft, now 100 feet down, to the 500 level. A hoist will be installed.

YAVAPAI COUNTY.

The Val Verde smelter has been started up under the supervision of F. E. Bretherington, late of Denver, Colo. There is a great deal of ore on hand and the supply is on the increase.

The Merchants' M. Co., which owns a group of mines in the Big Bug district, near the town of Providence, has reached the 200-foot level on its main double-compartment shaft. It is reported that 3 feet of concentrating ore in the lower workings of the mine goes $12.70 per ton in gold. E. Block of Prescott is manager.

The Home G. M. & D. Co., operating in the Weaver district, near Prescott, and owning five claims there, has a shaft down 200 feet in good concentrating ore. They propose to install a hoisting plant and continue sinking.

The Penn G. M. Co. is working about 100 men at its Mudhole mine on Lynx creek, 14 miles from Prescott, and are crushing over 100 tons of ore a day.

CALIFORNIA.

AMADOR COUNTY.

The Ogalalla G. M. Co. has been incorporated in Oakland with capital $25,000, to mine in Amador and El Dorado counties, Cal. The directors are: C. Smith of Oakland, J. W. Rigsby of San Francisco, N. M. Fay of Fruitvale, J. D. Maxwell of Latrobe, El Dorado county, and G. W. Bowles of Plymouth.

Chase & Sons have their machinery in working order and are ready to turn the Mokelumne river at Clinton Bar when low water comes. They have been mining there steadily for the last four years, with the view of ultimately getting into the river bed. This preliminary work has paid expenses as it progressed.

The tunnel on the Rabbit Hill lode, near Jackson, is being run in on the ledge and will be continued ahead for another 300 feet. The ore extracted is of good grade and carries 3% sulphurets. An arrastra is running continually, prospecting the rock, and 200 tons will be tried in a stamp mill before considering the putting up of a stamp mill on the property.

At the Kennedy mine the cutting of the stations and building of the chutes at the 2400 and 2500 levels of the east shaft have been completed. The chutes are estimated to hold about 1000 tons of rock each. Crosscutting toward the north shaft has been started from both the 2400 and 2500 levels. The total depth of the east shaft is 2630 feet, the deepest on the mother lode. About thirty men are employed in and around the shaft. It is said that a new 60-stamp mill will be built during the coming summer.

CALAVERAS COUNTY.

J. C. Jens, a shareholder of the Iowa Consolidated mines at Rich Gulch, and W. C. Ramsey of Stockton have been examining development in the mine and state that it is the intention of the company to erect a 40-stamp mill in the near future.

At the Sugar Pine mine, near Angels Camp, owned by the the San Joaquin M. Co., the new mill is completed and is to be started up for continuous operation. The mine is showing rock of good quality. J. McClay is Supt.

EL DORADO COUNTY.

The Toll House mine, near Placerville, has been sold at sheriff sale to a Mr. Perkins of Cleveland, O., who is one of the largest stockholders in the company, for $2084. There are over 100 acres of ground belonging to the mine and also a 20-stamp mill, with hoisting works and machinery.

The River Hill mine at Placerville is working a full force of men. The mill has been crushing 80 tons of rock daily and with a change in the drop of the stamps from 80 to 107 per minute it is expected to crush 100 tons of ore per day.

As the result of one day's cleanup at Lotus, it is reported that two men took out twelve pounds of gold, or about $3000. The locality is only 2 miles from Colma, where gold was discovered in 1848.

HUMBOLDT COUNTY.

At Hopkins creek, on the Klamath river, near Orleans, Miller Bros. of Sacramento are making preparations to operate their hydraulic mine on an extensive scale.——At the mouth of Slate creek, the Big Bar M. Co., A. Brown, Supt., is operating its mine night and day. The Big Bar mine is owned in Eureka. G. A. Waldner is president, and H. H. Buhne secretary.——J. Fehely and W. Lord have leased the Red Cap mine, opposite the mouth of Red Cap creek, and will reopen it. The mine has not been operated for years.——The Orleans Bar G. M. Co. is running up to full capacity, there being plenty of water.

INYO COUNTY.

A discovery, near Darwin, of a large deposit of tin ore is reported. The story is that the finder noted and traced the deposit, which showed an unknown mineral in large quantities. Roasting a piece of the ore in a forge, a button of white metal was reduced from it which on analysis proved to be tin. The exact locality of the find has not been disclosed, the finder not having perfected locations of the deposit.

MARIPOSA COUNTY.

C. Austin has bonded his mining properties in the vicinity of Whitlook to J. H. Gifford of Sonora at $35,000 for fourteen months. Four claims are included in the sale. Work is to be commenced at once. Helm & Donovan have also bonded their mine at Whitlock to Gifford at $6000.

NEVADA COUNTY.

The Delhi mine, near Nevada City, recently reopened, with G. Kartschoke Supt., is to have its machinery plant added to by the installation of a duplex compressor of fifteen drills capacity, run by water power. The water wheel will be 10 feet in diameter. It is also the intention of the Delhi Co. to erect chlorination works with a capacity of four tons of sulphurets a day.

The machinery is being put in order and other improvements made at the Franklin mine in Willow valley, near Nevada City, preparatory to sinking the shaft. M. Hussey is the owner.

At the Hampton & Gage mine in Willow valley, near Nevada City, a new hoisting plant is to be installed. Supt. Bray has decided to sink a new shaft.

E. Lawrence, Supt. of the Gold Tunnel mine, above Nevada City, has arranged for the building and equipment of a new hoisting rig and work on it has been started.

PLACER COUNTY.

Nine men are employed at the Shady Run quartz mine, near Towle. R. A. Watson is Supt. The company will soon let a contract to extend the lower tunnel 1000 feet.

The Bellevue M. Co. at Ophir are taking out high-grade rock from the California mine.

The Washington M. Co. at Forest Hill have sunk a double-compartment shaft 75 feet below the level of the tunnel. Drifts run 78 feet east and west show 3½ feet of ribbon quartz in the ledge.

Good quartz is being taken from the Decker mine, near Newcastle, by F. Brye, A. L. Smith, F. Bartlett and P. Lozano of Auburn and G. L. Threlkel of Newcastle, who is Supt.

SAN BERNARDINO COUNTY.

J. Johnson, late of Cripple Creek, Colo., verifies the report of the discovery of the rich gold mine at Dale. He writes from Dale, where he has investigated the new bonanza, and says that the new strike was found in a large iron ledge by crosscutting it to a depth of 30 feet. The ledge is about 100 feet wide. All of it will pay. The rich streak is 15 inches wide.

SHASTA COUNTY.

It is reported that the Quartz Hill mine, near Redding, is to be reopened by the Original Quartz Hill G. M. Co. of Chicago, Ill. The mine has lain idle for several years. Recently the company lost its mill and machinery by fire. A. Spetz, president of the company, and A. Kwasigood, secretary, both of Chicago, have recently visited the mine and previous to their departure stated that it would be worked and that the ore would be taken to Keswick to be smelted.

The Niagara mine, near French Gulch, owned by a Holland company and under the management of W. A. St. Auburn, is to be reopened. The first shipment of machinery and equipment is en route to the mines, which will be reopened through the old tunnels.

SISKIYOU COUNTY.

The Cherry Hill quartz mill at Cherry Creek, near Yreka, has been started up to crush ore from the upper or old tunnel. The new tunnel is in nearly 900 feet, and it is expected to strike the ledge somewhere between 1300 and 1500 feet from the entrance.

B. Kenyon of Yreka has put up a 3-stamp water power mill on Humbug, in connection with an arrastra. He owns seven claims. Some quartz taken out has paid as high as $300 a ton.

TUOLUMNE COUNTY.

The Jamestown M. & M. Co. has transferred to C. H. Treat of Los Angeles the bond on the Badger mine, near Jamestown, made by J. M. Palmer, A. L. Ellis, et al. The bond includes the Calker and Annie Dwyer quartz mines, adjoining the Badger. A 10-stamp mill will be erected on the Badger mine in the near future.

A company has been organized by Jeff Doolittle and A. Brown to dredge the Tuolumne river near La Grange for gold. The company has bonded the bottom land and orchards from La Grange down stream for 6 miles. The terms of the bonds permit the owners of the land to occupy it until the dredger gets actually to work in it and provide for a reversion. The wood on the river bank is also bought by the dredging company. T. Donahue of Sonora is the managing agent of the company. The work laid out contemplates the expenditure of $200,000.

The Campo Seco M. Co. is having an office and blacksmith shop built on its property, between Quartz and Jamestown. The sinking of a double-compartment shaft will commence shortly. J. H. Hall is Supt.

A lump of gold weighing eleven and one-quarter pounds, valued at $2400, has been picked up in the gravel claim of Conlin & Pownall, near Columbia.

The Black Oak mine, near Columbia, is reported to be in bonanza ore as the result of a strike that has been made in the north and south drifts at the bottom of the 1050-foot shaft. In the north end the ore is rich, going $70 to the ton. In the south it goes $30. The ore body is from 5 to 6 feet in width.

COLORADO.

BOULDER COUNTY.

The Silver Lake mine, near Ward, is being worked throughout the winter with a small force of men. The mine in 1901 was equipped with a modern hoisting plant, housed in a shaft house 28x40 feet. Development work only is being done to increase the ore reserves.

Late work in the crosscut tunnel being driven to cut under the shaft workings on the Red Lion mine, at Ward, develops that the tunnel has entered the ore zone 600 feet in from entry. Supt. Hutchinson says the tunnel is in an ore body or ledge of iron sulphides, with some smelting but chiefly milling ore.

CLEAR CREEK COUNTY.

A strike of very rich ore has been made in the North Star mine, at Argentine, which is being operated by M. Bonham & Co. under a lease and bond. Tests made on samples returned 12 ounces gold and 524 ounces silver. The ore is auriferous hessite, a telluride of silver and gold.

In the Empire tunnel, at Georgetown, rapid progress is being made, the average being about 5 feet per round. Quantities of live iron are found in the heading and the flow of water is also increasing, which is regarded as a favorable indication of a lode close ahead.

Manager Kelly is setting the boilers at the Kelly Tunnel plant, near Georgetown, and has the air line from compressor house to the tunnel connected up. He has built a powder warmer near the blower house. This is a small house in which hot water pipes will be run from a heater in the blower house, keeping a large quantity of powder in condition for use at all times.

Baer & Lees, who secured a large contract in the Manhattan tunnel from the Yankee Con. M., M. & T. Co., have driven the tunnel 220 feet and cut four veins in the first 190 feet. A party of engineers sent out by the company has selected the place for the new tunnel plant, which will be erected immediately. The company will install an 80 H. P. or 100 H. P. boiler and a 6-drill air compressor. The plant will be located about 200 feet from the tunnel entrance and to one side.

Idaho Springs people have bought the Silver Horn tunnel of L. McLean and are planning to extend it. The tunnel is now in 500 feet, the ore taken out in making repaying all the costs of driving it this distance by hand. J. W. Boyd is at the head of the enterprise.

The Detroit M. & Red. Co., a new organization composed of Idaho Springs and Eastern people, propose to build a new concentrator at Idaho Springs without delay. It will have a capacity for treating about 100 tons per day. Electric power will be used, but it will also have a steam plant for use in case of emergencies and will be heated throughout with steam. It is also reported that another mill having a capacity of 200 tons per day is being planned for Idaho Springs.

Manager J. Owen of the Morning Star mine on Seaton mountain, near Idaho Springs, is to put in a new hoist and compressor plant to sink the shaft to a connection with the Newhouse tunnel. He will also drift in the Newhouse tunnel along the vein.

The Seaton Mountain Electric Co. has completed stringing its wires to the Gem mines, which will put in a complete plant of new machinery to be operated with electricity.

CUSTER COUNTY.

A. B. Colburn, who has been prospecting west of Westcliffe during the past two years, claims he has finally discovered the pay rock in place. Gold is abundant in it and the yield is from $45 to $90 per ton. It is found in the granite near the contact between granite and porphyry. The gold appears in black tellurium, coating a kind of hematite along with a shelly kind of stone. Hundreds of acres have already been staked. Windlasses are being placed on some of the properties.

EL PASO COUNTY.

The tailing dump of the Metallic G. Ext. Co. at Florence, owned by the United States Red. & Ref. Co., contains 600,000 to 800,000 tons, which is now being treated at the rate of about 400 tons per day with a considerable profit, estimated to result in the aggregate to considerably over half a million dollars. The dump consists of tailings from the Cripple Creek ores which were supposed to have been worked close.

GILPIN COUNTY.

(Special Correspondence).—The Ontario-Colorado G. M. Co., operating on Gregory hill, near Central City, did 1229 feet of drifting, 130 feet of upraise and winze

work and 189 feet of sinking within the past year. The shaft is now 666 feet deep, the total drifting on various levels amounting to 2000 feet. The plan is to sink the shaft to 1000 feet depth within the next year. The production thus far has been only incidental to development. The mine has a modern plant of hoisting machinery, air compressor, machine shop and ore-sorting bins. By the time the mine is well opened up the company will doubtless have a mill erected. H. C. Eastman is manager.

Central City, Feb. 17.

The Klondike and Texas lodes at Russell are being operated by the Keystone G. & C. M. Co. of Cozad, Neb., with J. L. Mitchell as Supt. The shaft, now down 200 feet, will be put to a depth of 300 feet. A whim is being used at present for hoisting, but will be superseded by a gasoline hoisting plant at an early date.

OURAY COUNTY.

The Camp Bird Extension is testing ore and preparing plans for the erection of a large mill at Ironton. They have a 25-foot body of ore which is claimed to run over $20 to the ton, and have drifted on it for 400 feet.——The Red Mountain M. & M. Co. is getting in shape for work during the summer. The water is being taken from the shaft of the Hudson claim and development work is being done on the National Belle. About fifty men are employed at present.

PITKIN COUNTY.

The Argentum-Juniata M Co. report for the last quarter of 1901 shows for the three months' operation of the mine at Aspen $6749.25 net profits. The report of Manager Palmer states the production to be 2122 net tons, the gross value of which was $92,621.50. The railroad freight was $12,537.13, treatment charges $9514 14, and the net cash returns were $69,734.04, making the average value per ton $32 85. Out of the net returns of $69,734.03 had to be paid the shipping and selling expense amounting to $23,726, and payment to lessees $11,830, making $35,556. The mine and mill operating expenses amounted to $47,888. For the quarter, the "gross ton production per diem, running time," was 126.65 tons, average, as against 123.48 tons for the preceding quarter; the "degree of concentration" is 10.06 tons into 1 as against 10.87 into 1, and the "actual milling cost, per ton gross," is $0.7538, average, as against $1.0094.

SAN JUAN COUNTY.

O. Hansen, manager of the Idaho group at Silverton, being operated by the Schiffer Bros. of Alamosa, says that, after running a tunnel about 1000 feet, a strong 5-foot gold and copper-bearing vein was opened on which the showing, he states, was good enough to warrant the erection of a concentrating mill, and this work will be undertaken in the summer.

W. F. Kenrick of the Henrietta mine at Silverton, who has been giving a close study to the economic features in the operation of electric drills as compared with the old hand work, says that the hand drills have been making 1½ feet per shift by hand in extremely hard rock and at an expense in wages of $20 a foot, or a total of $30 a foot. With the electric drills the labor of two men costs $8 a shift, $1.50 for extra help at tramming and $2 for powder and expense of running the gasoline engine which drives the dynamo, which also lights the mine. This makes a total of between $11 and $12, as against $30 on the hand drill work.

The Wahuse M. Co. are operating on a large area of mining ground in Hematite gulch, near Silverton, under Foreman Lonergan. Work at present is in the lower tunnel on a large vein of concentrating ore. It is stated that the company has determined to build a large mill and connect it by tramway to the mines.

The Green Mountain M. & M. Co. have planned developments and made $10,000 immediately available for contracts on account of them. W. Bielefeldt, Supt., says that should the result of the proposed development be satisfactory the company will commence the erection of a 100-ton mill.

SAN MIGUEL COUNTY.

(Special Correspondence). — The Alta mill, in Alta basin, near Telluride, is operating successfully on ores from the Alta mine, which have an iron-lead sulphide base, carrying silver, gold, lead and copper, averaging $7 per ton. The milling method, arranged by C. M. Hampson of Denver, is one of first and second concentration, by which a saving of 76% is made. By a series of crushers, rolls and screens the material goes to Bartlett tables not less than 12 mesh. The table tailings pass over the new Bartlett slime tables, on which a substantial saving is made. The concentrate product runs about 3% copper, one-half ounce gold, thirty-nine ounces silver, 12% lead, 26% iron and 12% silica, the degree of concentration being 5½ to 1. At the mine an upraise is being made from the tunnel level to the upper levels, where a higher grade of ore is found.

Telluride, Feb. 24.

W. J. Scoutt, former manager of the Suffolk-Globe mines, has a contract to drive a tunnel on the Badger group at Telluride, owned by A. T. Hathaway of Colorado Springs. It is estimated that the tunnel will cost $8000 and will intersect the Crown Point and Santa Cruz veins 800 feet below the surface. Electric drills will be installed.

A rich strike has been made in the Cincinnati mine, at Telluride, owned by the Tomboy G. M. Co. The vein struck is 8 feet wide at the face and samples assayed show high values. The ore is a heavy galena thickly impregnated with gold. This mine is the northern extension of the Argentine, which was bought by the Tomboy Co. two years ago.

TELLER COUNTY.

At the Laura Lee mine, at Cripple Creek, under lease to Peterson & Stone, the whim is up and ore is being hoisted. A shipment of about twenty-five tons will be made from the property. Over fifty properties will start up as a result of the recent find. Guffey, Galey & McKelvy, who own eight patented properties adjoining the Laura Lee, will lease all of their properties but the nearest one, and on this they will proceed at once to sink a 1000-foot shaft.

The Cripple Creek-Colorado Co. has commenced sinking to the 1000-foot level with the new plant of machinery. The present depth of the shaft is 500 feet and it will be pushed down continuously. Included in the added equipment installed is a 6-drill compresser.

A report states that in the Bare Hills district, 12 miles west of Cripple Creek, W. Reed, a prospector, has developed an 8-foot vein of copper and gold bearing ore from which assays showed 20% copper and $23 gold to the ton.

The 700-foot level in the Doctor-Jack Pot mine at Cripple Creek, it is stated, has opened on the ore shoot which has been sought for during the past three months.

The Metallic M. & T. Co., owning on Rhyolite mountain, at Cripple Creek, has let a contract to D. Welch for 250 feet of work. There is a plant of machinery already on the ground. The tunnel is now in some 200 feet and will be driven to 500 feet.

IDAHO.

BLAINE COUNTY.

A strike has been made in the Glengarry mine, on the Hailey gold belt, owned by B. F. Oliver, who has been developing the claim by a tunnel that has struck the vein at a depth of 75 feet. The vein shows a streak of ore that carries high values in silver, some gold and a little copper.

C. F. Heckler, secretary and treasurer of the Union Standard G. Co., and M. L. Moyer, general manager, are expected from Philadelphia to start active operations on the Comet group, near Soldier.

IDAHO COUNTY.

H. L. Hollister of Hailey has bought from C. DeGrundy three claims adjoining the townsite of Roosevelt at Thunder mountain for $10,000. The first payment has been made.

H. E. Taylor of Weiser reports a new find at Thunder mountain, struck in a tunnel about 75 or 80 feet west of the main ore body that shows on the surface in the Fairview group. The ore prospects well in free gold and all is high grade.

A. J. Payne of Lewiston, manager of the Buffalo-Golden Gate M. & M. Co., which owns three claims in Buffalo Hump, says the company has not been doing any development work during the winter, but expect to resume operations about May 1. The mine has a 6-foot ledge of ore, with assays running from $10 to $30 per ton. He states that it is the intention of the company to put in a new stamp mill this summer.

W. A. Stevens, manager of the Big Buffalo Syndicate's properties in Buffalo Hump, says: "We are now running the mill with ore from the Big Buffalo, and the cleanups are satisfactory. The Jumbo is running constantly and is shipping from $5000 to $6000 monthly.——As soon as the Wise Boy mill is working, its bullion shipments will be fully as large. Machinery for the Wise Boy mill is now being hauled out from Stites and will probably all be in place by the last of March. ——The Crackerjack has been developed extensively this winter. The stamp mill machinery for it will be put in this summer.

The Thunder Mountain Free Gold M. & M. Co. has been incorporated at Spokane, Wash., capital $150,000, with J. Z. Moore president and R. F. Kellam secretary. The company says that it owns two claims —the Iconoclast and the Cripple Creek at Thunder mountain.

LEMHI COUNTY.

The Boston-Idaho M. Co. has been incorporated at Salt Lake City, Utah, capital $500,000, with W. H. Tibbalis president and E. J. Waugh secretary. The company owns the Emerald Isle and Dummy claims, together with a bond and lease on the Shamrock claim in the Spring Mountain district. The property was worked many years ago and, it is claimed, yielded good values in silver and copper.

OWYHEE COUNTY.

The newly organized Addie M. Co., recently incorporated by Silver City people, are reported to have made a very rich strike in an upraise in the mine. There is, it is said, 1 foot of the ore and it is said to run 50 cents to the pound in free gold. The reported strike is almost within the limits of Silver City.

SHOSHONE COUNTY.

A suit has been brought by I. L. Magee of Wallace against the Gold Hunter M. & S. Co. for damages for removal of ore from the Yolande mine, adjoining the Gold Hunter, and a restraining order to prevent the defendant from continuing work on it pending the trial of the cause.

The Alameda M. & M. Co. tunnel has cut the ledge, breaking into a carbonate ore when it passed through the foot wall.

MONTANA.

CASCADE COUNTY.

The Adriance mine, near Jericho, owned by B. Adriance of Brooklyn, N. Y., and R. Bennett of Neihart, is to be worked on a large scale, so the owners state.

DEER LODGE COUNTY.

In the Surething mine at Elliston a strike of 14 feet of concentrating ore has been made in the tunnel. P. Mack is foreman.

FERGUS COUNTY.

Plans for the new 100-ton mill of the North Moccasin G. M. Co., which will be erected near Kendall, have been completed by Engineer W. McClean, and construction works, it is stated, will begin as soon as the material can be placed on the ground. The mill will have some of the latest devices for the work of cyaniding ores.

FLATHEAD COUNTY.

Reports from the West Fisher mining district, near Libby, state that the Illinois & Montana M. Co. is finding some excellent ore. It is announced to be the intention of this company to place a 10-stamp mill on the property in a short time. J. H. Geiger is Supt.

LEWIS AND CLARKE COUNTY.

The Beatrice M. & M. Co., with D. G. Barringer of St. Paul president, E. Napp Supt. and A. McNaughton of Elliston, Mont., treasurer and secretary, has been developing its property at Elliston all winter, with a view of erecting a mill next summer. The company has been blocking out ore so as to get ore reserves in sight before building.

MADISON COUNTY.

E. C. Villiams and B. Krodell of Butte, who have a lease and bond on the Occidental mine at Brandon, are to begin operations on it at once.

The Eureka mine, near Brandon, has been bonded by R. J. Ogden and S. Pritchett to Jackson Bros. of Twin Bridges at $5000. Development work consists of a 60-foot tunnel.

O. B. Suhr, general manager of the Madison Power Co. of Norris, says the machinery of the plant was run without a hitch. The present capacity of the plant (3000 H. P.) has been bought by a Butte mining company, and it is the intention to erect other plants along down the Missouri river canyon.

PARK COUNTY.

W. L. Tipton of Spokane, Wash., who has a bond on the McCauley mining properties in the Crevase district, near Jardine, states that work will be commenced on the property. The mill is to have two new concentrators installed before starting it up.

SILVER BOW COUNTY.

W. A. Clark is reported to have sold his Colusa-Parrott group of mines at Butte to the Amalgamated Copper Co. The purchase by the Amalgamated Co. has been made as a settlement of the litigation between the Anaconda Co. and the Colusa-Parrott Co. The Anaconda ledge was involved in the suit, it having been shown that there was a union between that vein and the Colusa-Parrott vein at a depth of about 600 feet below the surface of the Colusa-Parrott, and that the latter was the prior location. At the trial of the case the Anaconda Co, advanced the theory that there was a third veir, called a diagonal or blue vein, which cut the Anaconda vein and caused the union of veins by a fault or slip, and that in fact there was no union. Judge Knowles of the U. S. Circuit Court accepted that view of the case and decided in favor of the Anaconda Co. There was developed at the trial the fact that the Anaconda Co. had been mining on one of the Colusa-Parrott veins not included in the original controversy, and another suit for heavy damages was brought against the Anaconda Co. and is now pending. All litigation will now be dismissed. The sale includes the Colusa-Parrott mine and smaller mines known as the Parks-Parrott and the Micawber.

A. McIntyre of Walkerville, who is opening up a group of five quartz claims in the Vipond mining district, says he is sinking a 300-foot shaft and driving two tunnels on the property. The shaft is now 166 feet deep and one of the tunnels is in about 200 feet. All of the hoisting from the shaft is done with a whim. So far no water has been encountered. The property is known as the Vipond group. The ore contains copper, gold and silver, and is shipped for treatment.

NEVADA.

EUREKA COUNTY.

It is stated that the Richmond mining property at Ruby Hill, Eureka, has been sold to the Eureka Con. Co. Negotiations have been pending for a long time.

NYE COUNTY.

The Utah-Tonopah M. Co. has been incorporated in Salt Lake City, Utah, with $5000 capital. Le Grand Young is president and W. C. Spence secretary and treasurer. The company owns seventeen claims in the Tonopah mining district. G. T. Halladay, Supt. of the company, has a small force of men at work.

WASHOE COUNTY.

The Grey Mountain Copper Co. has been incorporated at Reno, capital $25,000; C. Stewart, E. E. Roberts, S. Platt, J. Richardson and J. B. Vieira directors. The company is to consolidate interests covering a number of claims near Reno. A tunnel will be run on the Stewart-Roberts ground, one of the claims.

The Nevada Con. M. Co. at Reno has started a new shaft and the workings are now down 45 feet.

The Willow Creek mine, near Washoe, has been sold to J. R. White for Eastern people for $15,000. The mine has been idle for a number of years.

NEW MEXICO.

COLFAX COUNTY.

The strike in the Bob Tall mine, near Elizahethtown, is greater than was first anticipated. Assays show 100 ounces of silver and 4 ounces of gold per ton. Development work is being pushed rapidly and the Smithfield M. Co., operating the mines, is figuring on the erection of a plant to handle the ore. F. Spurr is manager.

LINCOLN COUNTY.

A strike of gold and copper ore is reported made near Jicarilla by P. Miranda, and six men have been put to work. The lead is claimed to be 6 feet wide.

SIERRA COUNTY.

The Dude M. Co., operating near Hillsboro, expects to put in hoisting machinery and sink its shaft to a depth of 500 feet before doing any stoping.

A rich strike has been made by the Lake Valley M. Co. at Lake valley. The ore, it is claimed, assays 200 ounces silver from an average sample from a 4-foot breast.

O. D. Warnock of Alamogordo, Otero county, has bought a mining claim at Jarilla upon which he has made a find of a 20-foot vein by panning test of free gold showing from $30 to $60 per ton. An incline shaft has been started and will be sunk 200 feet.

The Prosper M. Co., recently organized to operate mines at Hillsboro, has commenced operations on the Prosper group with A. J. Hearst as general manager. It is the intention of the company to sink a shaft 1000 feet.

SOCORRO COUNTY.

The Last Chance M. Co. is erecting a cyanide plant to work over the hattery tailings. The plant will have a capacity of fifty tons. F. McKinley is chemist at the works.

OREGON.

BAKER COUNTY.

The Badger mine on Elk creek, near Susanville, is at an elevation of about 4300 feet. The country rock is slate. At present the rich ore is sorted and shipped to smelter. The developments consist of an incline shaft 250 feet deep, with drifts and tunnels aggregating 1500 feet.

JACKSON COUNTY.

It is reported that Ament Bros., who recently bought the Corliss mines in Dry Diggings district, near Grants Pass, are preparing a large hydraulic mining project—the building of a dam across Rogue river below their mines, gaining a 20-foot fall, and the installation of a battery of turbine wheels sufficient to furnish 3000

H. P., which it is proposed to use to pump 1200 miner's inches of water through a mile of piping to the mining grounds above. About 200 men will be required to put in the dam, and the whole plant is projected to be ready to be put into operation by the close of the coming summer. The plant will cost $160,000. Ament Bros. own 600 acres of placer mining ground.

GRANT COUNTY.

W. H. Jackson, Supt. of the Belcher group, near Alamo, states that P. A. Brady of Spokane, Wash., is making a thorough testing of the ores of the Belcher, and when the best process of treatment is decided upon a plant of 250 tons daily capacity will be installed.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Wasp No. 2 M. Co. of Deadwood has made a cleanup of $7000 from a 100-ton cyanide plant in the Yellow Creek mining district. The plant will be greatly enlarged in capacity this season.

The Homestake Co., at Lead, is pushing work on the second cyanide plant, which is intended to treat the tailings of the stamp mills on the north side of the Lead hill. The first plant, with a capacity of 1200 tons of tailings daily, is now saving to the company about $20,000 monthly, which amount was formerly lost in the tailings that went down the creek.

UTAH.

BOX ELDER COUNTY.

The Tyche M. Co. has been incorporated at Salt Lake City, capital $5000, with E. W. Wilson president and S. P. Armstrong secretary. The company owns the Great Halk mining claim in Johnson's creek canyon, an unorganized mining district.

IRON COUNTY.

W. J. Halloran and F. Wilson of Salt Lake City, owners in the Johnny mine at Stateline, report the mine as presenting an excellent appearance, with ten men blocking out large bodies of gold-bearing ore. Arrangements are being made for the erection of a 20-stamp mill to be installed about the first of May. W. J. Dooley is Supt.

A strike is reported in the Jumbo group of claims at Stateline, owned by Rice Bros. A body of gold ore yielding good values has been encountered. It is reported that a 9-foot vein of good ore has also been opened in the Margaret mine on the 60-foot level.

PARK COUNTY.

At the annual stockholders' meeting of the Daly-West M. Co. at Park City a resolution was passed authorizing the sale of the assets of the company to the Daly-West M. Co. of Colorado. The new corporation is capitalized at $3,000,000 and its officers are A. Hanauer president, A. C. Ellis Jr. vice-president and H. McCornick secretary and treasurer. J. E. Bamberger, president and manager of the original Daly-West, in his annual report says the past year shows a net gain of $200,000, of which $80,000 is in the treasury and $120,000 is represented by increased dividends. The report shows the total receipts as $1,115,568.11 and the expenditures, including twelve dividends, were $1,034,-050.67. The dividends aggregated $607,-500. The output of the year was 163 lots —32,097 tons of ore — which produced 1,326,448 pounds of copper, 15,586,973 pounds of lead, 1606.72 ounces of gold, 1,755,454 ounces of silver and 10,931,699 pounds of zinc. A recapitulation and summary of the year's work shows: Mill in actual service, 315½ days; ore milled, 57,773 dry tons; ore milled per day, 183 tons; concentrates produced, 12,926 tons; tons of ore concentrated into 1 ton of concentrates, 4½; per cent of lead saved, 92.8; per cent of silver saved, 70.2; present daily capacity of the mill, 225 tons.

SUMMIT COUNTY.

The annual report of the Daly-West M. Co. of Park City says that in the 57,773 dry tons of ore treated at the mill there were 3986 tons of pure zinc, 54% of which, or 2172 tons, was shipped to the smelter. In commenting on it F. W. Sherman, the mill Supt., says: "While this zinc, in conjunction with the lead concentrates, is only a detriment, yet, should the same be separated from the lead, iron and silica, the zinc in the year's crude ore would have a value of over $100,000, f. o. b. cars Park City. Already sufficient work has been done along the line of separating the zinc from Park City ores to prove that the same can be done successfully."

SALT LAKE COUNTY.

Development work is in progress at the Neptune-Kempton mine, at Bingham, and ore is being taken out. The mine is under a six years' lease and bond to E. A. Wall and associates.

The Tesora concentrator at Bingham, to which some additions were made recently under the direction of J. B. Fleming, is now running satisfactorily. About 100 tons of ore are treated daily, resulting in some thirty odd tons of concentrates.

TOOELE COUNTY.

The Mono M. & M. Co. has been incorporated at Salt Lake City, capital $50,000. The officers are G. A. Land president and E. L. Hall secretary and treasurer. The company owns a lease on the dump and old workings of the Mono and Star mines at Ophir.

UTAH COUNTY.

Locations have been made along a vein near Springville, northeast of Provo. The ledge is said to carry good values in silver, with some gold. W. Ferre claims he has discovered a 2-foot vein of galena on the face of the mountain near Provo.

WASHINGTON.

FERRY COUNTY.

The Hawkeye mine at Republic has its shaft down about 225 feet in solid ore of shipping grade. It is understood that negotiations are pending for the erection of hoisting machinery of sufficient capacity to handle 100 tons daily.

A strike is reported to have been made on the Summit, near Keller. At a depth of 42 feet the ledge is 6 feet wide and assays run as high as $100. The property is owned by the Silver Creek M. & M. Co., which is running a tunnel to get a depth of 300 feet.

LINCOLN COUNTY.

S. Noble has bought $1000 worth of placer mining machinery and is installing it upon a new placer discovery on the Columbia, 12 miles below Peach. The gold so far discovered has been extremely fine.

WHATCOM COUNTY.

Balfour, Guthrie & Co. of San Francisco and Evans, Coleman & Evans are preparing to erect at Whatcom a $1,000,000 plant for the manufacture of Portland cement. The firms named have bought 620 acres of land near Sumas which contains clay suitable for the manufacture of Portland cement. Constructing Engineer Cederberg is in charge of construction at Whatcom. The factory and clay works will employ 400 men the year round.

WYOMING.

CARBON COUNTY.

The Southern Wyoming Tramway Co. has let a contract to J. S. Carey for the immediate construction of an aerial tramway connecting the Ferris Haggerty group of mines with the Boston-Wyoming smelter at Grand Encampment. The tram will be 15½ miles long, and will be completed by August 1st. The Boston-Wyoming smelter is expected to follow its construction by being enlarged from a 100-ton daily capacity to a 500-ton daily capacity.

The Hidden Treasure M. & T. S. Co., operating at Battle, is reported to have cut a 50-foot vein of ore carrying copper, gold, silver and some nickel. Assays show it to run from $150 to $200 and over. This tunnel is now in 500 feet and a contract has been let for 200 feet more. H. M. Rice is general manager of the company.

FOREIGN.

BRITISH COLUMBIA.

J. P. Graves, manager of the Granby copper property at Grand Forks, B. C., says that while no definite plans have been formulated looking to the immediate establishment of a copper refinery, such is ultimately the intention of the company. There is no reason, he says, why the refining of copper cannot be done as cheaply, if not cheaper, than in the East. At least our company has determined to test the matter.

Two carloads of zinc ore have been shipped from the Bosun mine, New Denver, to Antwerp, Belgium, where, it is said, the most satisfactory treatment can be obtained for this class of ore. The Bosun has shipped ore there before and has made a profit out of the experiment. The ore runs 45% and upwards in zinc, besides silver values over eighty ounces to the ton.

It is reported that the Montreal-Boston Copper Co., owning the Sunset and the Crown Silver mines, has bought the Standard Pyritic Smelting Co.'s smelter at Boundary Falls. The purchasers are already arranging to add to the equipment of the smelter with the intention of commencing smelting within seven or eight weeks. It is stated that A. J. Goodell of Pueblo, Colo., will have charge under the new owner. A large new hoisting engine is now running at the Sunset mine, where preparations are being pushed to get an output to keep the smelter going.

Three copper smelters on Vancouver Island within a few miles of Victoria are building and to be in operation during this year. The smelter at Osborne bay is well in hand, the one at Ladysmith started, and P. O. Caesar of Tacoma, Wash., and P. Law of Seattle, Wash., who represent Baltimore, Md., people, have selected a site for a third smelter at Maple bay to treat ore from the Lord Roberts claim and that of the Yreka C. Co. on Mount Richards. Assays from the Lord Roberts claim give $8 gold and 17% copper. A 5x9 shaft is being sunk between the veins, each measuring 4 feet across, there being a distance of about 12 feet between the walls. The smelter company intend to erect their works at the foot of a cliff on the bay shore and will have water power from Somenos lake.

The British Columbia C. Co.'s smelter at Greenwood has completed its first year's work. The furnace was blown in on February 18, 1901, and with a short stoppage — about nine days in August for necessary repairs—it has been in continuous operation and has smelted 138,139 tons of ore, or an average of 378½ tons daily. Its present average is higher, the run for the first forty-eight days of 1902 having averaged 428⅜ tons per day. P. Johnson is Supt. of the smelter.

C. R. Leonard of Butte, Mont., has been elected president of the Brittannia C. M. Co., operating on Howe sound, near Vancouver. G. H. Robinson, T. M. Hodgens and F. M. Leonard, also of Butte, Mont., have been elected directors.

MEXICO.

H. R. Thomas of Chicago, Ill., representing the Gold Coin M. Co., has bought the Bogan and Pesquira gold mines, in Guijas district, near Arivaca. The ore averages from $5 to $10 per ton and is free milling. D. S. Cochran is manager.

TRANSVAAL.

The first batch of natives from Mozambique has arrived at Johannesburg to work in the mines. Permission has been granted to mines to resume crushing in the following order: The Village Main Reef, Reitfontein A, Robinson Deep, Lancaster West, New Goch, New Primrose, Simmer & Jack, Jumpers Deep, Glencairn and Knight's. All are expected to start by the middle of April.

Personal.

JOHN B. FARISH, of Denver, Colo., is in London.

WILLIAM FARISH, of Denver, Colo., is at Kendall, Montana.

I. MCKAY of Park City, Utah, is now located at Tonopah, Nev.

J. H. HALL is Supt. of the Campo Seco mine near Jamestown, Cal.

A. B. THOMPSON is Supt. Deep Blue Jupiter mine at Dogtown, Cal.

A. F. DEAN, of Redding, Cal., is sojourning in San Francisco, Cal.

W. H. JACKSON has been appointed Supt. Golconda mine, Alamo, Or.

D. B. GILLIES of Butte, Mont., is sojourning at Salt Lake City, Utah.

H. L. VAN EMON of San Francisco, Cal., is sojourning in Salt Lake City, Utah.

MAX BOEHMER, M. E., Denver, Colo., is at Butte, Mont, on professional work.

H. D. OTTE has resigned as foreman of the Grand Mogul M. Co. at Silverton, Colo.

A. J. HEARST has been appointed general manager of the Prosper M. Co. at Hillsboro, N. M.

J. COPLEY is now Supt. Mack mine, at Big Oak Flat, Cal. T. Coyle has been appointed foreman.

G. W. CROWE, manager of the Arizona G. & C. Co. at Patagonia, Ariz., is in Guaymas, Mexico.

W. BIELEFELDT has been appointed Supt. of the Green Mountain M. & M. Co. at Silverton, Colo.

F. SPURR is manager of the Smithfield M. Co., operating the Bobtail mines, near Elizabethtown, N. M.

D. S. COCHRAN has been appointed Supt. Bogan & Pesquira gold mines, near Arivaca, Sonora, Mexico.

T. P. ROHLFING, formerly Supt. Horn Silver mine at Frisco, Utah, is now experting properties in Wyoming.

A. J. PAYNE, manager of the Buffalo-Golden Gate M. & M. Co. at Buffalo Hump, Idaho, is in Philadelphia.

O. O. SAXHUNG has been appointed assistant manager of the Sonora M. & M. Co. at Tubutama, Sonora, Mexico.

A. BOHN, of Leadville, Colo., is in the vicinity of the City of Mexico, Mexico, examining some mining propositions.

S. D. PIERCE, manager of Old Terrible M. Co., Cochise county, Ariz., has returned from a trip to Boston, Mass.

H. VAN F. FURMAN, of Denver, Colo., has made arrangements to represent a large German mining syndicate in Mexico.

T. SINGLETON of Glasgow, Scotland, managing director of the Crystalline mine near Rawhide, Tuolumne county, Cal., was at the mine for several days last week.

W. H. HALL, C. E., of New York, is in Sonora, Cal., engaged in examining a power proposition on the Stanislaus river.

ARTHUR L. PEARSE has returned to London after a lengthy tour in Korea and China, where he has been examining mines.

H. P. GALLIGAN, Supt. Galvin Dredging Co., at Weaverville, Cal., has gone to Callahan's, Siskiyou county, to start up a new dredger.

J. M. BECKWITH, formerly manager of the Silver King mine, Calico, Cal., is now manager of the Becerrea mines, Lugu, Galicia, Spain.

A. MCNAUGHTON of the Beatrice M. & M. Co. of Elliston, Mont., is in St. Paul, Minn., to confer over plans for a mill on the property.

C. T. DURELL is Supt. of all the mines of the Central Montana Mines Co., including the properties at Spotted Horse and Kendall, Mont.

N. C. RAY of Coulterville, Cal., is engineer for the Mariposa Electric & Power Co, which is building a power plant on the Merced river, Cal.

C. S. COWAN, formerly assayer at the Afterthought mine, Trinity Co., Cal., is now in the assaying department of the Anaconda Copper Co., at Butte, Mont.

HARRY K. WHEELER, formerly with Capt. De Lamar and later at Sumpter, Or., has located in Los Angeles, Cal., where he will practice his profession of mining and civil engineer.

W. L. HONNOLD, formerly of Calaveras county, Cal., goes to Johannesburg, South Africa, via New York City and London. He will act as consulting engineer for the Con. M. Selection Co., Ltd.

R. A. JONES has resigned as master mechanic of the Dalton & Lark mines, at Bingham, Utah, and has associated himself with C. D. Hitchcock in mechanical engineering in Salt Lake City, Utah.

Commercial Paragraphs.

PROCTOR PATTERSON, general manager of the W. S. Tyler Co. of Cleveland, O., has been in the Southwest looking over business in the interests of his company.

THE Link Belt Machinery Co. of Chicago have contracted to furnish two of their latest pattern placer mining dredgers to the Zaragoza Mining Co. of Zaragoza, Colombia, South America.

S. W. TRAYLOR is the manager of the New York City office of the Colorado Iron Works Co. of Denver, Colo., at 25 Broad street. In addition to the general office is provided an engineering department.

THE Pacific Coast Rubber Co. has moved to the new Crocker building, Nos. 453 and 455 Mission street, San Francisco, Cal., where a large line of rubber hose, belting and asbestos metallic packing is carried.

E. T. HEWITT AND GEORGE DILLMAN, under the firm name of the Hewitt & Dillman Mine Supply Co., have opened an office at room 610, 330 Market street, San Francisco, Cal., their chief business being the supply of shoes, dies, etc.

THE E. H. Stroud Co. of Chicago are now the sole American agents of the Cyclone pulverizer, a machine that has done good work in Europe and other countries. Several of the pulverizers are now in operation in the United States.

THE J. H. Parsons Chemical Co. of Chicago, manufacturers of boiler compound, have recently greatly improved their laboratories and are better prepared than ever to examine waters sent them by their customers and intending customers. This company are making a specialty of treating boilers at mines and smelters, and have a large clientage among these industries.

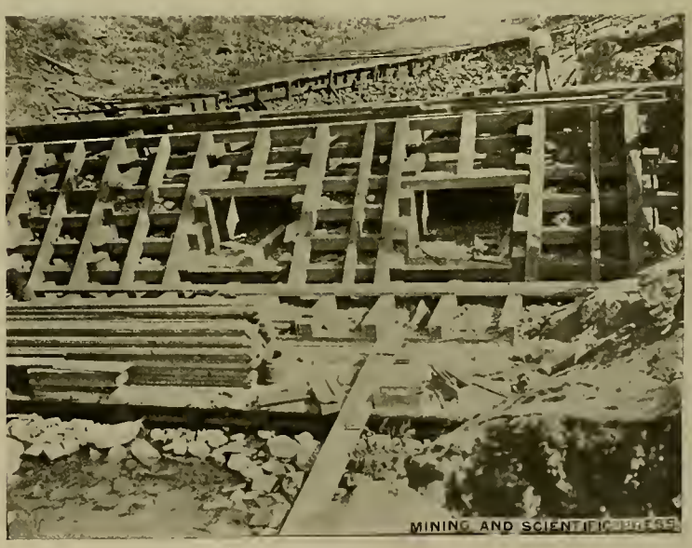
THE firm of Griffin & Cameron, general contractors and builders of gold dredgers, has been organized. The firm is oomposed of F. W. Griffin, M. E. Griffin and D. P. Cameron, with offices at 209-210 Safe Deposit building, 328 Montgomery street, San Francisco, Cal. They are Pacific coast representatives The Bucyrus Co., South Milwaukee, Wis., and the Robins Conveying Belt Co., New York City.

THE new shops of the American Engineering Works at Chicago are now in full operation, these shops being equipped with latest machinery. The American Engineering Works manufactures the Overstrom diagonal concentrator, mine cars, stamp mills and other mining machinery. Orders received to date on the Overstrom table are reported sufficient to keep the concentrator table department busy for months.

THE W. S. Tyler Co. of Cleveland, Ohio, are extending their business in

MINING AND SCIENTIFIC PRESS.

Whole No. 2172.—VOLUME LXXXIV. Number 10. SAN FRANCISCO, SATURDAY, MARCH 8, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.



Melones Mining Company's Dam and Flume, Robinson's Ferry, Stanislaus River, Cal.—(See Page 126.)

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....$3 00
All Other Countries in the Postal Union..... 4 50

Entered at the San Francisco Postoffice as second-class mail matter.

J. F. HALLORAN..... Publisher.

☞ MR. GEO. S. SCOTT is now our Chicago representative, office 737 Monadnock Bldg., Chicago, Ill., and is authorized to transact business on behalf of the MINING AND SCIENTIFIC PRESS.

San Francisco, March 8, 1902.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Melones Mining Company's Dam and Flume, Stanislaus River, Robinson's Ferry, Cal., 123. Section of Dam on Stanislaus River, Melones M. Co., 126-127. Plan Showing Surface Currents in Settling Box 129. Mining and Metallurgical Patents, 132 Cyclone Disintegrator; Cyclone Pulverizer. 132

EDITORIAL.—Change in Form and Appearance of This Publication; Gas Engine Motors; Mine Taxation in Colorado; Placer Strikes of Alaska and the Yukon; Inducements to Stockholders in Mining Company, 124.

MINING SUMMARY.—134-135-136-137.

LATEST MARKET REPORTS.—137.

MISCELLANEOUS.—Concentrates, 125. The Melones M. Co. Dam, Stanislaus River, Cal., 126. The Betty Cyanide Process; Method in Thinking Out Engineering Problems, 128. The Treatment of Clay Slimes by the Cyanide Process and Agitation, 129. The Use of Petroleum for Power Purposes, 130. Electric and Compressed Air Mining Locomotives; Lead and Zinc District of Joplin, Mo., 131. Gas and Gasoline Engine Ignition, 132. Mining and Metallurgical Patents, 133. Personal; Commercial Paragraphs; New Patents; Notices of Recent Patents; Recently Declared Mining Dividends, 137.

OF late years suggestions and requests of subscribers and advertisers for a change in the form and appearance of this publication have been frequent. In accordance therewith, a change will be made in its "make-up," embodying the principal points so embraced. For nearly forty-two years the MINING AND SCIENTIFIC PRESS has been appearing in its present shape. The arrangement of the contents of each issue will be in different form throughout, which, we trust, will be to the greater value and convenience of our patrons everywhere.

GAS ENGINE MOTORS, which have an extended and satisfactory use in Europe and the Eastern States, may soon come naturally under consideration for installation in the mines and other industrial establishments in the West. This result is likely to follow as a consequence of the development of the petroleum industry in California, Colorado and Utah. In all three States the transportation of the bulky petroleum by rail to the point of consumption is the chief item of cost and tends to limit the use. The direct use of crude petroleum for fuel, particularly in cities, also has some disadvantages. Projects to gasify the petroleum at the wells and to send the gas, compressed, through pipe lines to distant markets are being considered in connection with the new petroleum deposits, and will eventually be consummated. The petroleum gas fuel will, however, be available directly as a prime mover used in what are described as gas engine motors. By their use there would appear to be possibilities of economies in the operation of many plants, and, it can be added, a further extension of the use of power. Services for which it is now regarded as too costly, and which, therefore, are not undertaken, become possibilities with the lowering of power costs.

MORE than the usual winter's tale of placer strikes in new and old localities is now coming out from Alaska and the Yukon. While they are surely occasioning stampedes of the prospectors and miners who are in the country they will create no rush from the outside. Rich placer strikes announced in the winter have so frequently failed to materialize in the spring that reports of them no longer inspire the adventurous crowd. This time, though, there is reason to believe that the reports fairly represent the facts. They are not particularly extravagant in the claims made and the discoveries are located where there has been reason to anticipate them. The discovery of a so-called second bedrock in some of the Klondike claims is not a novel feature in placer mining, and it is well known that much of the early mining there was careless and overlooked very large gold values in from 2 to 4 feet of shattered surface bedrock on which the gold-bearing gravel rested. The discoveries back of Porcupine district were really made in the summer of 1898, but were turned down then because they were not extraordinarily rich like the Klondike placers. The Kuyukuk and Copper river placers are the natural development of persistent prospecting in regions already known to be gold bearing. They are all worth the attention of the prospector and miner.

Mine Taxation in Colorado.

The contest in the Colorado Legislature over the taxation of mines has been settled temporarily by the adoption of a rule of taxation, by which producing mines are to be taxed at a sum not to exceed the net output of the preceding year, and non-producing mines at 25% of the gross output of the lowest producing mine in the county.

The reports that have come to hand state that the rule is the choice of the miners and meets with their approval. While this is probably true at this time, it is at least doubtful whether their approval will be lasting, and it is highly improbable, when it is closely studied, that it should be regarded as finally removing the question from consideration as being something finally settled.

It is assumed that where the language of the Act says, "taxed at a sum not to exceed the net output of the preceding year," it means "assessed at a sum, etc."—the assessment value so determined to be the basis of taxation. If a definition of "net output" were made part of the law; if, as in the Montana law, this net output so defined was made the assessment valuation without the proposed qualification of the Colorado Act where the words "not to exceed" are employed; and if the Act as in Montana were to declare a definite percentage of the net output to be the tax; then the law, judging from the experience of Montana, would settle the question. But the Colorado Act is not a copy of the idea of the Montana law, but is designedly indefinite and uncertain where the latter is definite and certain.

The proposed Colorado Act would seem, in addition to the indefiniteness referred to above, to contain a new provision of doubtful value in the rule set up for the taxation of mines that are not producing. By not producing, it is assumed the Act means, not producing a profit. But why should the gross output of the lowest producing mine be the basis of estimation rather than the net output of the lowest producing mine? Why the gross output of the lowest producing mine rather than the gross output of the highest producing mine? One part of this clause has the merit of definiteness, the rate of assessment shall be 25% flat without any discretion allowed to an assessor. Consider a possible case of taxation under this Act. Suppose that at Leadville a mine makes 500 tons of $3.50 ore a day and at the end of the year shows a gross output of $542,500 and a net output of $2500, and that every other mine in Lake county making a net output made a larger net output than $2500. Then under the strict application of the Act this producing mine could not be assessed at more than $2500, its net output, and every non-producing mine in Lake county would have to be assessed at 25% of $542,500, or $135,625. This will be said to be an extreme case, but it is a possible case, and it is the extreme cases that show the weakness of rules.

It is perfectly practicable to frame and apply a just and equitable rule for taxation of mines. The Montana law is such a rule. To begin with, there must be a clear, intelligible definition of the thing which is subject to taxation. A mine is property, certainly. But what is a mine? It will not require much consideration to see a distinction between a mine that is property in the tangible, legal sense and a mine that is not property in such a sense. The first kind of a mine that is really property is the mine that has a measurable quantity of ore in sight that can be appropriated to produce a value to the appropriator. A value for it is the quantity of the excess output over its cost. The other kind of a mine is a creature of the miner's imagination. Though perhaps realizable, it is not real. The miner hopes and believes he has a mine and uses the word as if he had. What he really has is merely the right to get the mine if it exists. While the miner has the right to believe he is going to have a mine, and to sell his belief to another miner, the belief is no more a taxable entity than is the good will of a corner grocery. What is taxable in the grocery is not the belief of the proprietor as to the future profit of his business, but the stock of goods in his store. When it comes to taxation of the corner grocery the two things are not confused. There is no reason why the two similar things should be confused in determining what kinds of mines are property that is taxable and the kinds of mines that are property that is not taxable.

If such a clear understanding of what kind of a mine, and it might be added, what part of it was real and tangible property, subject to assessment and taxation, were made the beginning of legislation on mine taxation, the establishment of an equitable rule would not be difficult of formulation and establishment. The effect of it would be to relieve from taxation locations, prospects and undeveloped or unprofitable holes in the ground. It would put it on mines capable from ore in sight of making a net output and would not measure it in excess of that net output. The Montana law makes a fixed per cent on actual net output, the reasonable equivalent of what is defined above as the estimatable net output.

The preceding is not suggested as a substitute for all taxation on the things that are part of a mining property. Land has a value as land independent of the mineral; it may be very little, but it is something. Machinery and tools have a value independent of the particular mine they are in use on. It may be but a fraction of their cost, but they are worth something. These things could be accepted to pay just debts. They are real things, equitably taxable at the values as such, not at what they are worth as part of a particular mine plant. Dead work is not a real property, it cannot be separated from its situs as personal property. It has no value by itself. It is a mere evidence of part of the cost of mining. It is not taxable property. What the preceding is intended to suggest is, that the proposed Colorado law of mine taxation will not really tax mines that are real property that is equitably taxable, but will tax what are really not "mines" at all, but are only "rights to make mines," which, though property, are not the kind of property that is equitably taxable, or on which as between different individual rights, taxation by the proposed law can be made equal.

STOCK in a mining company, which claims to be doing something at some place not definitely stated, out in the desert in Riverside county, Cal., is being advertised in a prospectus that is a gem in the inducements it offers to people to become stockholders. It states that the stockholders are owners in a lot of engines, boilers and other machinery, a drug store, harness rooms, 160 acres of land, of which forty acres are enclosed with a barbed wire fence and used as a pasture for the company's mules, a cottage, bunk house, corral, all buildings being substantial and modern, horses, mules, burros, stages and wagons, oil lands, sandstone quarries, gypsum beds, iron claims, many good roads and trails, a spring of soft water, more than the mills can possibly use, and five acres of a vegetable garden. It adds that the company has no saloons at the mines, does not allow liquor, beer, gambling or dance houses on the grounds and employs quiet and peaceable miners. Evidently the promoters think the inducements offered will sell the stock like hot cakes, else they would have spoken of the mines that the company proposes to work as at least an incident of the proposition. Of course, there are mines of some kind somewhere in the plans of the company promoters, but the prospectus is silent concerning them. It does not say whether they are gold, silver or some other metal. The "ore" is not referred to at all, nor is there any mention of prospective dividends. It is possible, however, that the promoters are only trying to tell the truth. It is quite possible that they are not sure about having a mine, or that there will be dividends, but are sure of the mules, the spring of soft water and the five acres of vegetables. Not desiring to deceive an investor in the mining stock, they are only offering to sell him what they are sure he will get for his money—a share in the mules, the drug store and the spring of soft water. The prospectus is a work of art that is artless. The stock is only 50 cents a share, and there is so little of it left that the promoters say the advertisement will not appear again. Really, the buyer of the stock on the representations of the prospectus will never be able to say that his mining investment is a failure.

Concentrates.

AMALGAM is an alloy in which mercury is one of the components.

THE gauge of ordinary steel and iron wire is the same as that of copper. Piano wire has a gauge of its own.

AN engine of 40 effective H. P. can pump 4000 cubic feet of water from a depth of 365 feet in seventy minutes.

SILVER 71.89%, copper 28.11%, gives an alloy that has a lower melting point than other silver-copper compound.

A ¾-INCH NOZZLE, under fifty-two pounds pressure per square inch, will discharge 13.43 gallons of water per minute.

POWDERED ANTIMONY or heated copper foil will burn with an evolution of light if dropped into a jar of chlorine gas.

ONE THOUSAND gallons of water per hour constantly flowing under a 6-inch pressure is equal to 1¼ inches, miner's measurement.

THE average cost of gold dredging may in a general way be stated to be approximately 4½ cents per cubic yard of material handled.

A FLOOR for a smelter furnace room can be made of a concrete composed of Portland cement, sand and furnace slag in lieu of natural rock.

A GOOD BASIC LINING is furnished by the following composition: Magnesia, 36%; lime, 52%; silica, 8%; alumina, 2%; oxide of iron, 2%.

THE abandonment of a mining claim cannot be presumed, but must be of such a nature that it can be clearly established by evidence before a court.

TO FIND quantity of water elevated in one minute running at 100 feet of piston per minute, square the diameter of water cylinder in inches and multiply by 4.

A TRANSPARENT etching ground for retouching can be made by mixture of the following ingredients: Retouching varnish, Sandarac, 1 ounce; castor oil, 80 grains; alcohol, 6 ounces.

IN northeastern Utah is the only deposit of ozokerite known to "Concentrates." The pending exhaustion of the Galician ozokerite mines makes manifest the possibilities of coming profit from the development of the Utah deposits.

PLATINUM is 21½ times heavier than an equal bulk of water; gold, 19.32 times; lead, 11.37; copper, 8.82; iron, 7.86; antimony, 6 71. Platinum melts at 1775° C.; gold, 1045° C.; lead, 327° C.; copper, 1050° C.; pure iron, 1600° C.; antimony, 425° C.

IN a tank 10 feet diameter at the top, 12 feet diameter at the bottom, 12 feet deep, fed by a pump discharging 150 gallons water per minute, and having when pump is started a depth of 2 feet of water, it would take forty-six minutes to fill the tank.

THE average efficiency of the incandescent carbon filament electric light is from four to five watts per candle power, and its average life is less than 400 hours at this mean efficiency. This is the equivalent of 9.3 to 11.7 16 C. P. lamps per H P.

THE new smokestack at the Selby Smelting & Lead Works, Selby, Cal., is 180 feet in height. The tallest chimney in the United States is that of the Oxford Copper Works, New Brighton, Staten Island, N. Y.—365 feet in height above the ground.

WHERE a vein is discovered in driving a tunnel at a point 250 feet below the surface, a valid location of the claim can be made by marking the boundaries on the surface at the place at which the vein, if continued to the surface, would be discovered.

MINE LOCATIONS in California are assessed as possessory claims and the taxes, when collected at all, are collected as taxes on personal property. A sale to the State for unpaid taxes conveys no title to the State in the land of the mining claim, which is public land of the United States.

WIDE TIRES are all right for earth roads, and, to some extent, for macadam roads. When tires exceed a certain width, however, they are likely to bear unevenly, the weight being thrown first on one edge and then on the other, as the wheels pass over the more or less uneven surface of the road.

A CORRECT "average assay" may be obtained as follows: Multiply the weight of each lot of ore by the assay of such lot, add the products of such multiplications and divide this sum by the sum of the weights of the various lots of ore; the quotient of such division will be the average assay required.

BY DRYING at 100° C. all the moisture in wood may be expelled, but on subsequent exposure to the air at the usual temperature the wood will reabsorb from 18% to 20% of water. Wood inflames at a temperature of 300° C. in the presence of oxygen or air. Wood will weigh five times as much as the charcoal produced from it.

A MILLSITE PATENT gives a valid title to any mineral deposits, lode and placer, that may be discovered after patent issues. The lodes discovered subsequent do not take extralateral rights. The grant of the patent is not of a lode mine but of a tract of land bounded by vertical planes. A subsequent discovery of a mine not granted does not confer a purely mining right outside of those boundary planes. A lode discovered on the patented millsite is not subject to location on the millsite. The lode is locatable outside of the lines of the millsite patent, and the apex line for such a location must be the line of the millsite patent that the lode dips under.

REVISED STATUTES OF THE UNITED STATES, Section 2323, and privileges granted therein, apply to one locating a tunnel for discovery and developing purposes, but failing to prosecute work thereon for six months is an abandonment of the right to all undiscovered veins on the line of the tunnel, but not the bore of the tunnel.

SODIUM AMALGAM consists of one part of metallic sodium and thirty parts of mercury. It is liquid at a very moderate heat, but solidifies on cooling to a hard crystalline mass. It is cast into ingots which are kept in air-tight iron vessels with lime to absorb any moisture, which would act upon the sodium in the amalgam and convert it into soda.

MINING MACHINERY MANUFACTURERS gladly accord every facility of information to probable or possible customers, furnishing considerable preliminary technical knowledge of material value in the effort to secure business. Indeed, in many instances the gratuitous service so rendered might be rightly regarded as expert engineering work, for which a fee might with propriety be forthcoming.

BY adding arsenic to copper, in the proportion of one to ten, a white malleable metal is obtained not easily tarnished by air and much harder than copper. This alloy is employed for fine clock dials, for thermometer and barometer scales, and is made by heating in a covered earthen crucible five parts of copper clippings with two parts of arsenious acid, arranged in alternate layers and covered with common salt.

IN building flumes in dry weather the condition of the board lumber used should be noted. If dry and seasoned it should not be nailed to make close joints. An allowance should be made for the swelling of the boards when they become wet. Partly seasoned lumber or even lumber green from the saw can be used for flume construction. When battens are used in the boxes it is best to nail only one edge till they have been well soaked up by the flowing water.

A MATTE suitable for converting should not contain less than 45% copper, or the proportion of iron would be unduly great, would lead to the production of an unmanageable bulk of slag, and the siliceous lining of the converter would be severely attacked by the oxide of iron formed. Nor should it carry more than 60% of copper, or there would be insufficient sulphur and iron to provide the necessary heat by oxidation. From 50% to 55% is usually preferred.

IN the case of Muldrick vs. Brown, as reported in 61 Pac. Rep., the decision of the court was that under Rev. St. U. S. Sec. 2320, requiring the discovery of a vein or lode within a quartz claim before any right can be acquired thereto, it is enough to entitle the discoverer to protect his mining rights if ore or metalliferous rock be found in place sufficient to warrant a prudent man in spending time and money on it, though it may not contain ore in paying quantities.

TRUE GRANITE is composed of quartz, mica and feldspar. Granite with black mica or biotite is commoner than with white mica or muscovite. The quartz is distinguishable by its gray, crushed, translucent appearance, with no crystalline face or form. The feldspar usually shows a part of one flat face of the glistening crystal. The mica is easily recognized by its bright glitter and color. Hornblende, when present, is indicated by a duller luster than mica, a greenish black tint and longer crystals.

THOSE "Concentrates" to the number of about 3000 per year are mainly answers to questions on every conceivable subject connected with mining, metallurgy and engineering weekly received from readers. To publish the questions themselves would weekly take several pages, but an attempt is made in every issue to give on this page a condensed correct answer, briefly worded, where the subject is of sufficient importance to be a matter of probable information to many others beside the individual questioner.

THE removal of a posted notice of location from a mining claim, and the substitution of another for it, with other parties as the locators, does not divest the parties who posted the original notice of the rights that the law vested in them through making the claim. Presuming the original posted notice to have been made in conformity with the law so as to constitute a legal location of the claim, the parties who removed it and substituted their own notice of location are trespassers. Some of the States have statutes making it a misdemeanor to remove or destroy corner monuments.

DIRECT-CURRENT motors are usually wound for 110 or 220 volts for general service, and in exceptional cases, where a higher voltage is admissible, 500 volts are employed. The construction of the induction motor being more advantageous for higher voltages than those for the direct-current motor, it follows that higher voltages may be safely employed. The 200 and 400-volt induction motors are in general use where 110 or 220 volts would be employed if direct-current motors had been used. For higher voltages it will often be found that the conditions which would make 500 volts direct-current allowable will permit the use of 1000 volts for alternating-current motors. In this way a decided advantage is given to the alternating-current motor in the point of economy in the conductors for supplying the current. For power work only, the three-phase system would be selected, as it would effect a saving of 25% in line copper. Where light and power work are combined, the two-phase system would give the best results.

DRY COAL DUST by itself is claimed to be non-explosive in a coal mine. This contention is based on experiments which show that it will not explode by contact with an ordinary flame, such as a miner's lamp or candle, or a blasting powder fire. The active agent in causing the explosion of the powdered coal is said to be the presence with it of marsh gas or the mixture of explosive gases known as fire damp. Possibly the power carbon has of absorbing gases may have part in forming an explosive mixture. Wetting down the coal where it is to be shot is claimed to decrease the chances of an explosion of the powdered coal.

IN the scorification method of assaying a small charge of the powdered ore sample is weighed and mixed with eight or ten times its weight of test lead, in a shallow fire clay dish called a scorifier, covered with another eight parts of test lead. The scorifier is then set in the hot muffle, where the lead first oxidizes and fuses with the ore, then the excess of lead oxide reduces and takes up the precious metal which alloys with the lead. When the reaction is completed the contents of the scorifier are poured into a mold and the lead bullion button is separated and treated by cupellation exactly as in the case of a crucible assay.

A GOOD FLUX for lead assaying must be readily fusible to protect the lead from volatilization; it must contain excess of carbon; the amount of borax present must not be excessive, otherwise lead will tend to pass into the slag chemically combined as a borate; it must act as a desulphurizer. The following makes a good lead flux: Bicarbonate of soda, 16 parts; carbonate of potash, 16 parts; borax glass, 8 parts; flour, 5 parts. Where used in the proportion of three of flux to one of ore, with a salt cover and two iron nails in the charge, it will be found ordinarily to give satisfactory results in the case of oxidized or sulphide ores.

REGARDING the posting of mining applications, the claimant is required to post a copy of the plat of survey in a conspicuous place upon the claim, together with a notice of his intention to apply for patent therefor, date of posting, name of applicant, name of claim, mining district and county, whether or not the location is of record and, if so, where the record may be found, giving the book and page thereof, the number of feet claimed along the vein and the presumed direction thereof, number of feet claimed on the lead in each direction from point of discovery or other well-defined place on claim, names of all adjoining and conflicting claims, or, if none exist, the notice should so state.

THE Supreme Court of Idaho, in Hall vs. Blackman, has ruled that in Idaho prescriptive right to the use of water cannot be acquired by the use thereof with the consent or permission of the owners, and as under the law of the State it is made a misdemeanor for one who has the right to the use of water to waste it, and the law requires him to permit it to flow down the stream in case his necessities for the time do not require its use, it is made by the law difficult to acquire a prescriptive right to the use of water. For, if the law requires the one entitled to the use of water to let others use it in case he may not for the time need it, they may have its use under the provisions of the law, which commands the consent of the owner.

THERE is always a loss of pressure in an electric current when it flows through a conductor, the loss being equal to the product of the resistance of the wire and of the amperes of current. Then when a number of incandescent lamps are fed from a circuit at a considerable distance from the supplying source, the wires of the circuit must naturally be quite heavy in order that the loss in pressure shall not be too great. On an incandescent lighting circuit it is common to allow a loss of pressure or drop amounting to as much as 10%—sometimes even as high as 20%—when working at its full capacity. The circuit should be so arranged that all the lamps on it shall be fed with current at as near a uniform pressure as possible, and, if the drop allowed is too great, this becomes a difficult matter, on account of the continual change in the amount of current flowing as a result of lamps and motors being turned on and off the circuits.

THE horse power capacity of a boiler may in use prove to be greater than its rated capacity, though more often it proves to be less. If it can be made to evaporate more water in a given time than rated for, its capacity is correspondingly higher. This increased capacity may show itself in the ability to produce its rated quantity of steam at a higher pressure than its rated pressure, which means a higher temperature for the steam and a larger amount of heat received by the same quantity of water than estimated for in the rating. That is, the boiler may make a gain on its rated horse power efficiency, either by providing more than the rated evaporation at the rated pressure, or by providing the rated evaporation at a higher pressure than the rated pressure. It must not be overlooked, however, that where the use of the steam a boiler makes is not constant it stores itself up and the boiler pressure rises. This does not mean increased boiler efficiency, however, and must not be confused with it. The higher pressure of steam in the engine gives the latter a larger output of horse power when it is in use. A boiler should not be run at higher than its rated pressure.

The Melones M. Co. Dam, Stanislaus River, Cal.*

The Melones M. Co. of Boston, Mass., William C. Ralston of San Francisco, Cal., manager, which is operating the Melones quartz mine at Robinson's Ferry, Calaveras Co., Cal., has during the past year built a part of the power plant to supply power to the mill, a frame dam in the Stanislaus river. Accompanying this are reproductions of the plan of the site of the dam and of a plan and elevation of the dam proper, the design and construction being in charge of L. F. Warner, Jr., C. E. On the front page are views of the dam construction at several stages, and of the flume leading from the dam to the mill.

Preliminary work for the dam was commenced on August 1, 1901. Construction on diversion flume commenced August 15th, construction of dam started August 29th, and the gates were closed and dam filled on October 8th—forty-one days actual construction.

It was impossible to reach bedrock clear across the river without great expense of pumping, so a space 55 feet in length in the center of the dam rests upon boulders and gravel.

The dam is constructed on crib plan, cribs being 8 feet square of 10x10-inch square timbers (ordinary pine), drift-bolted together with ¾-inch round iron 14 inches long. Every sill which came in contact with the bedrock was drift-bolted to it with 1-inch round iron.

Lumber used.....284,467 feet

* See illustration herewith and on front page.

Cost of lumber	$ 5,502 21
" labor	8,423 93
" supplies (including packing on mules)	1,620 82
Total cost	$15,546 96

Cement (concrete wall for water way), 242½ barrels at $5 ..... $ 1,212 50

After the dam had remained full and overflowing for thirteen days, on the 21st of October a leak developed through the gravel which, however, was soon stopped by filling in the upper side of the dam with earth and rock. The water has gone over the crest 5 feet in depth without any injury to the structure appearing.

The concrete waterway leading from the dam to the headgate is found to be a very satisfactory arrangement for taking the water. A much easier regulation of the flow through the gate is effected through the long wall overflow keeping a constant head at the gate. The concrete wall overflow also relieves the dam proper of some of the water that would otherwise be turned over its crest. In order to protect the toe of the dam and to make sure that water under the pressure of the dam head would not get under the portion of the structure resting on gravel, the entire back of the dam at the toe was filled in with clay and rock, several thousand yards being deposited there by the carriers of an aerial tramline. This line is shown on one of the front page illustrations. It was double, a full bucket descending on one line by gravity from the hillside pulling up the empty bucket on the other line. This mode of filling was found to be exceedingly cheap and the protection to the dam afforded by it is perfect, there having so far been no signs of undercutting or any settlement of the crest line.

From the site of the dam started in 1900, but

abandoned through early fall storms bringing high water stages into the river before construction was fairly under way, there was during 1901 constructed an additional 6080 feet length of flume to the dam described above. The entire line from the dam to the wheel pit at the mine consists of:

Length of flume construction			16,864 feet
"	" tunnel	"	758 "
"	" ditch	"	816 "
Total			18,438 feet = 3.49 miles
Lumber used in construction, board measure			1,455,000 feet

The portion of the flume constructed in 1901 was 654 boxes (10,462 feet), 8 feet wide inside by 4 feet deep, increasing the size 1 foot in width over the old flume.

The flume is built of ordinary mountain pine, dimensions of the lumber used being: Bent posts, 8x8 inches; caps, 6x8 inches; stringers, 6x8 inches; sills, 6x6 inches; posts, 4x6 inches; caps, 4x6 inches; angle braces, 3x6 inches; foot braces, 2x6 inches; bottom planks, 2x14 inches; side planks, 1½x12 inches; all planks, 16 feet long.

The work of clearing, grading, as well as the construction, was done under the supervision of the engineer of the company, A. M. Reynolds.

Dam to old dam site, 6080 feet, cost per foot, $2.76½; total cost	$16,814 34
High trestle to grade, 1411 feet, cost per foot, $3 65⅝; total cost	5,159 88
Grade to tunnel, 2971 feet, cost per foot, $2.22½; total cost	6,617 26
Total cost	$28,591 48
Average cost 10,462 feet of flume	$2 73⅜ per foot
Lumber used in construction	994,024 feet

Fearing a rise in the river (the construction being made late in the season) it was not deemed wise to handle the lumber by floating it down the river, hence the flume was built from the lower end. The delay in the delivery of the lumber by the sawmills and railroad caused postponement of work at different times and made a consequent increase of cost per foot.

Both constructions, the dam and the flume, are substantial and efficient for the purposes designed. The construction costs are notably low considering the magnitude of the works and the physical difficulties that had to be overcome. For the excellence and economy of the work, the engineers, L. F. Warner, Jr., and A. M. Reynolds, are entitled to full credit.

The Betty Cyanide Process.

The precipitation of the gold from cyanide solutions is effected by zinc or by electrolysis. Both methods are efficacious, but with ores as pure as those of the Witwatersrand the precipitation by zinc is considered the better for concentrates and sands. For very weak solutions from the treatment of slimes it would have been inapplicable if Mr. Betty had not devised a simplification of it.

The Betty process enables the gold to be precipitated from extremely dilute solutions. It is consequently specially adapted for the treatment of slimes. The principle is as follows: The zinc cuttings are immersed in a solution of acetate of lead, and are thus covered with a coating of lead. They are placed in the precipitating vats and the solution is passed through. A current of fresh solution of cyanide is added during the process. The zinc and lead form an element of a galvanic pile, and the gold is precipitated on the lead that covers the zinc.

In preparing the zinc, the fine cuttings are placed in a solution of acetate of lead (10%). The zinc is moved about continuously, and care is taken to obtain a lead coating on both sides. When thus prepared it is immediately placed in the precipitation tank, which is filled with the auriferous solution, so as to obviate contact with the air. The second important point is the addition of the cyanide solution at the top of the tank. A 2½% solution is prepared by dissolving twenty pounds of cyanide in seventy-five gallons of water. This solution is allowed to run freely into the tank with auriferous solution for about four hours, thus bringing the strength of the solution to be precipitated from 0.007% to 0.025%. When these twenty pounds of cyanide have been used, a second solution is prepared in the same way with ten pounds of cyanide, and it is allowed to run into the tank for six hours. It brings the strength to 0.007%. After twelve to fourteen hours a small piece of cyanide is allowed to fall into the auriferous solution, and the strength is brought up to 0.007% to 0.008%, and this is continued throughout the precipitation. With a precipitating tank 25 feet long, 6 feet wide and 5 feet deep, and divided into five compartments, fourteen to fifteen tons of solution may be treated hourly. By degrees the zinc loses its precipitating properties. After ten days the zinc in the first compartments must be replaced. Instead of using the zinc from the last compartments for the purpose, it is more advantageous to put in freshly prepared zinc and to use the inert zinc in the precipitation of solutions stronger in cyanide derived from the treatment of the sands.

The advantages of the Betty process over the Siemens & Halske process are: (a) more complete and quicker precipitation, (b) diminution of the cost of installation, (c) suppression of electric plant, (d) diminution of the volume of the precipitating tank, (e) economy in the cost of working, and (f) no royalty. On the other hand the drawbacks are (a) the necessity of transporting the zinc from one tank to another, and the consequent lack of accurate check on the operations, (h) the frequent cleaning of the tanks, and (c) it is not proved that a better yield is obtained. The cost of treating 10,300 tons of slimes by the Siemens & Halske process is said to be as follows: Potassium cyanide, $0.133 per ton; lead, less litharge, $0.0665 per ton; motive power, $0.019 per ton; royalty, $0.0285 per ton; total, $0.247 per ton. The cost of treating 11,300 tons of slimes by the Betty process is: Potassium cyanide, $0.0855 per ton; zinc, $0.057 per ton; sulphuric acid, $0 038 per ton; motive power, $0.0085 per ton; acetate of lead, $0.0085 per ton; total, $0.1985 per ton. These prices do not take into account the labor, lime, general costs and depreciation, which are the same in both cases, about $0.475 per ton. The two results are not strictly comparable. It is impossihle, therefore, to assign distinct superiority to either of the two methods.

Method in Thinking Out Engineering Problems.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

There is no use in reflections upon the nature of a manager's mind unless there can come out of them some systematic method of enabling the confused, incapable mind, groping about in its dark room, to find the knob of the door and come out into capability. Existing methods have but one word in solution of this problem, and that is environment. A man is surrounded by the methods and utilities with which he has to deal, and gradually observation takes hold; there is much imitation, and a little reasoning from cause to effect, and the practical man is produced.

Sometimes this product can hardly be called a finished one, and with any change of situation the subject is again confused, seeing "men as trees walking," and only gradually getting the scale and color of the new surroundings.

I cannot see but that much of this procedure is inevitable. We must have a stock of images and relations as the sub-structure and foundation of the edifice. It does not, however, follow that the architect should go on duplicating mudsills to the height of domes and pinnacles. Having got a start, and images enough to bank upon, we should no longer be satisfied with reliance on the accidental throwing together of ideas, hoping that they will be overruled for good arrangement, but should proceed in a course of rational design.

In all modern scientific advances the method of comparison is a stronghold. It began in the science of language. P. T. Barnum was wont to quote scripture out of compliment to his wife, Charity—"without Charity I am nothing." The study of philology in like manner amounted to nothing until it became comparative philology. To say nothing of comparative anatomy and comparative religion, we have recently had several papers on comparative dimensions of engine parts, exposing great variations, and serving to correct the practice of engine design.

The method of science is essentially comparison. Invention, which goes a step beyond science in fitting its discoveries for usefulness, ordinarily does this by using the method of substitution in addition to comparison.

Invention has been described as a habit like punning upon words, which habit grows with practice. Some men, like Crosby, Richards and Edison, have great numbers of patents to their credit, showing the habitual exercise of the inventive faculty until it becomes second nature, while, on the other hand, great numbers of people invent nothing.

Such facts argue a method, and the method is comparison with substitution. This substitution results in new combinations, and a combination patent is an expression which covers many results of this method of substitution. The use of certain familiar reagents in chemistry is a like method of "trying it on," by means of which new properties and relations of matter are revealed.

Invention is a regular part of the mental equipment of a mechanical designer. "Pring me anydings, an I invends it for you," said a German, meaning that he would elaborate designs in pursuance of any suggestion. Invention is expected in the American manager. The question is frequently asked in employing a new mechanical foreman, "What improvements has he made to secure better economy of working?"

But a man may say, "It is not in me to invent." No man knows what is in him. We may go on one of two notions, either that inventive ideas strike a man like unbidden lightnings (unbidden as lightnings are supposed to be, although, in fact, every thunderbolt comes in answer to a call), or that he may draw them to him by processes of thought within his own control. Taking the latter view to be the correct one, a person of the contrary part might say that it was "up" to me to produce the processes.

As an example of working out engineering conclusions by a process of comparison and substitution, let us take a chain of phenomena accompanying construction, such as this:

A lightning rod is extended from the damp ground up above a building that it may collect the electric discharge from the clouds upon a conductor, and so prevent the damage which would come from the discharge of the bolt through the poorly conducting materials of the building.

Apart from this series, let us then take an isolated fact on the treatment of which we wish to throw some light—the electrolysis of water pipes.

Josh Billings called the caterpillar a slow bug, and much of the entertainment of humor lies in far-fetched analogies. Electrolysis is a very slow thunderbolt, but both are forms of electrical discharge, of combustion, of energy. The air is comparatively non-conducting, but the electric current bolts through it. The earth is a better conductor, but not good enough to carry the current, so it goes to the iron pipe as the premium goes to preferred stock.

The lightning rod is a path set for the current to travel in. The iron pipe is a path on which it trespasses. The depressed head of the common street car rail makes convenient, smooth running for ordinary vehicles, but street car companies, wishing to discourage such wear of their tracks, struggle to put in the tee or rounded head rail, which does not afford a nice pair of grooves for teamsters' wheels. If tramway companies, animated by this motive of exclusion, substitute tee for grooved rails, water companies may substitute coated or composition pipe which will discourage electrical flow.

The iron pipe is, however, cheaper and is already laid in thousands of miles of streets. Turning from the idea of impairing it as a road for electricity, we have the alternative of providing a preferred route for electricity as the rod leads the bolt quietly away. The rod leads to something, namely, the ground. The conductor that we may devise to prevent the current from going to the pipe must be already in the ground and must lead to a better—and this, again, to a still better—conductor; but what finally? A Roman general was asked his ambition. "To conquer Italy." "And after that?" "To conquer Africa." "And after that?" "To conquer the world?" "And after that?" The idea of conquest being at the end of its string, he was obliged to fashion a new idea, so he said: "To take my ease, and be merry." In like manner we must reach another idea than that of an electrical current flowing in one direction.

This idea is that the current which we had thought of as single is really dual. The conductor is not merely an avenue from one thing to another in one direction. There is in it an element of mutuality. The electric charge in the clouds does not, with eagle vision, select the copper rod and strike. The charge reaching up from the earth into the copper rod is doing its part in an attracting power as real as that of the bolt, equal to that of the bolt, and silently exerted through the air before the resistance is overcome. We think of the bolt going to earth, its destination as a traveler, a one-sided force. Trying to use this idea in prevention of electrolytic action on pipes in the ground, we are obliged to use a better conductor than the ground to a different destination than the ground.

We lift a weight from earth, and it falls to earth. The fact that the earth falls to the weight is too small to be easily perceived, and it is only discovered in science by the partial parallels of analogies drawn from other phenomena. Finding no absolute destination in the case of electrical action in the ground, we are driven to see that it is dual. Important inventions often hinge upon the perception of a simple fact of this kind. Agassiz put a student to the test of describing a crustacean. The young man reported again and again all the things that he could notice about it, but the scientist would not be satisfied until he put down on his paper that right and left sides were alike, that it was a dual creature. This was a thing that anyone might see, but few would definitely notice and use to a purpose.

The hundred-ton concentrating mill composed of two fifty-ton mills, side by side, so that one can be repaired while the other continues at work, is like a man with two organs of each kind most exposed to injury. I have an amiable friend who has just repulsed an all but fatal attack of pneumonia. One lung was solid and useless. But for having the alternative of another, his mill would have shut down for this world. But the surgeons stimulated the operating lung with oxygenized air, cut their way to the closed lung, removing a section of rib to reach it, and drained it of dead matter, making it active again.

One crusher often serves both sides of a double mill. One set of organs that are less liable to be put out of work serve a man.

The electrical action in the ground is like drawing apart two weights pressed together by a spring. On release they again come together, and if one is comparatively small its travel is great, and it has a transit like the passage of a current.

Electrolysis of a pipe is one of the most troublesome problems before engineers for solution. The destruction of city water pipes is a serious calamity. The lightning's bolt strikes a tree and splinters it

with one blow. The electrolytical action is like a series of imperceptible blows, whose effect is only noticed in the aggregate, like the incessant small raps of a pene hammer, by which hard metals are "pened" are swaged and caused to flow.

We are, then, led to ask what draws these forces apart that they should be in position to strike together so usefully, and also at times so dangerously. It is a power applied as in pumping, as in the heaping up and apart of water that it may come down and together again. The sun is "drawing water" continually, little by little, but it is no small thing which comes down in the cloudburst.

Only within a few years past have men learned the trick of parting the elemental forces whose effort of reunion is electrical power. The discovery of new static elements goes on apace, mostly so designated because they make lines in the spectrum. Many of them have not been developed as of industrial significance, and we might question whether a new line in the spectrum was good reason for giving a substance the name and dignity of an element. The spectra of elements are still complex. But the spectrum will bear watching. It enables us to say this is, and this is not. To it all static elements come to test, and in it we may find new general laws for all elements, and with them new powers and utilities. But exactly what are these cracks in the spectrum, these natural slotted screens with darkness or luminous color back of them, and is it not likely that they will disturb the very democratic idea that each element is a positive "it," or definite unit, with one vote in the universe? I have several ideas coming on this subject, but when I speak of electrical elements I mean something of a different kind, live ones, those that are in the province of the maker of power.

The direct current was first utilized by the trick of commutating alternations at one point. This arrangement was, no douht, due to an imperfect understanding of the nature of the electrical current. A device—the commutator—was invented to get rid of the alternations, rather than to use them. All through the industrial arts we have arrangements for throwing away things with uses. The compositor may throw out "the durned horned e" that he does not understand. The early Leadville miner, looking for something else, threw out the ore which he called "heavy porphyry," until some one took the trouble to analyze it. The early electrical idea was to get rid of alternations. Later came the understanding and application of the alternating current, which not only excels the direct in its field of usefulness, but is a better general expression of electrical action.

So, mentally considered, we make our way from the conception of Franklin with his kite string drawing sparks from the clouds to the conception of our modern electricians working with the alternating system—for example, Tesla and Ganz, the latter giving name to a system which threatens to supplant the direct current systems still employed in most tramways for urban and interurhan transportation.

But some one may say: It is easy to go over what other men have already thought out. Go farther. If you have found any device of mechanism in thought, push this thinking machine into the future, as a miner pushes a coal-cutting machine into a vein, and cut out what it holds for us.

Recent expressions of Tesla have been thought speculative, vapory and impracticahle. They have not heen popularly understood. Understanding moves slowly in the invasion of new fields. It is conceivahle that we can hy exercise of power—not without it—so separate the elemental forces in nature anywhere that power will he made available for use without going to waterfalls after it. This clue we have from finding electrical action to he a parting of elements by power. This, to be sure, is only stating the proposition. It is not finding a solution, hut it indicates where we ought to look for it.

And where are we to look for a solution of the problem of the electrolysis of water pipes? Simply to this fact, that our separated elements whose reunion is power must be effectively harnessed as yokefellows. They must he kept apart, as the elements of rackarock are kept apart, till they are ready for use. They must not he allowed to leak through earth as straggling corrosive powers. It is like all large questions touching human affairs, an ethical as well as an engineering question.

In early periods land was held in common, especially pasture land. Agriculture and individual ownership brought in fences. Now, in the development of electricity, new boundaries of neighborhood rights and privileges must he planned. The conductor, to safeguard the rights of others in the new-found world of electrical power, must be double—direct and return. That is where we come out as a conclusion on electrolysis. The expense of complete guarded return current lines must he provided. But what is good for neighborly interests is also best in electrical engineering. In Chicago there has been much trouble hecause the electric roads lack power to do their work. Mr. Ellicott, the electrician of that city, charges this inefficiency to the defective return circuits through rails with defective honds, causing a waste of one-third the power. The power which works mischief is lost for good.

This train of thinking is hut an illustration of processes of comparison and substitution. The strength of the practical man lies in the fact that he has at least one complete system with all the details of which he is familiar. Give him hut one fact in another field or place, and he commences to draw parallels from it and construct a system similar to that of his experience. When he finds the parallel will not work, he is mistaken and learns something. Criticism introduces him to new arrangements. "Every knock is a hoost" toward that facility in meeting requirements with suitahle plans which should distinguish the engineer. And his proficiency comes from keeping "everlastingly at it" with the comparative method.

The Treatment of Clay Slimes by the Cyanide Process and Agitation.*

NUMBER IV.

By E. A. H. TAYS and F. A. SCHIERTZ.

DISCHARGE.—When first arranged, a 6-inch flange was holted to the side of the agitator, so as to hring the hole on a level with the hottom. Into this flange was placed a nipple, on which was put an elhow just tight enough to turn with ease; and into this elbow was set, at an incline of ahout 20°, a 3-foot length of 6-inch pipe, which discharged into a large V-shaped launder, running hetween the tanks, under the floor. This launder carried away the pulp.

Into the end of the discharge pipe a big plug was driven, over the end of which a stirrup would drop, to hold it in place. This plug was secured hy a chain to the floor, to prevent its heing carried away hy the charge, when knocked out. We soon found that the 6-inch discharge was hard to control while discharging; so a plate with a 4-inch hole in it was holted over the opening, inside the tank. This gave perfect satisfaction; and ten tons of slimes could be run out inside of thirty minutes.

As soon as a tank was discharged, water was run in and the tank washed out. Ahout one hour was required from the time of starting to run in the water until the tank was ready for the next charge. The whole operation of treating a charge of ten tons of slimes occupied ahout twenty-three hours. The six agitators would he charged by noon every day, and on the following day each would he discharged and cleaned, ready for a new charge, ahout one hour before the time for charging it.

TAILS SAMPLES.—About 2 feet from the end of the discharge launder was a 1.5-inch hole through the side, tapping the hottom. Five minutes after a discharge hegan, two tails samples (one liter each) were taken at this hole: one to he washed and dried, to show total extraction; the other to be evaporated, to show actual recovery and soluhle gold.

When we were experimenting we made many tests on taking tails samples, sampling one charge every five minutes from the start to finish of discharging. These samples were so nearly uniform in value that it was seen that any one of them would have given practically the same results.

We also found that samples taken from the surface of the charge, while in agitation, checked well with samples taken from the discharge launder. The agitator was always kept going until the charge was out and the tank washed.

SETTLING BOX. — In decanting we could draw off 80% of the settled solution perfectly clear; hut with the remainder, small thread-like streams of slimes would he carried over also; and these, though seemingly insignificant when mixed with all the solution, sent a somewhat turhid solution to the zinc hoxes, notwithstanding the considerahle settling which took place in the storage tanks. To obviate this difficulty we put in a large settling hox, which helped matters materially. (The form and dimensions of this hox were shown in the illustration which appeared in the last issue.) The solution, after decanting, as already described, was pumped up from the receiving tanks to the settling hox at the rate of ahout 125 gallons per minute. The discharge end of this box was 8 feet across, and the surface current was nothing to speak of, up to within the last foot of the discharge; so that although the solution, run into the storage tank, still carried some slimes in suspension, the quantity was so small that a heakerful, settling over night, would show harely a trace on the hottom.

After we had put in the settling hox, we used to draw off the clear solution as close as possihle, even if more or less fine slimes did come off at the end. The whole secret of settling is: to make sure, first, that all suspended matter shall he thrown toward the hottom; and, second, that the flow over the edge of discharge shall he so thin as to reduce the current to a minimum.

We found that 125 gallons per minute was a little too much for even the 8-foot discharge to handle, as the overflow was nearly 0.125 inch deep. An overflow 2.5 feet wide was then cut on each side, at the same level as the end overflow, as shown at g, g, in Fig. 3, a little hack of the center of the hox. This gave very good results, and, with the aid of other arrangements in the storage tanks, sent the solution to the zinc boxes with very little suspended matter.

Before the side overflows were put in, the surface current was measured, and found to amount to 125 gallons per minute, with a velocity of 10 feet in 6 minutes from the head of the box; the next 15 feet in 8, and the next 20 feet in 9.5 minutes. After the side overflows were put in, the rate and direction of surface currents were established as shown in Fig. 4.

The float for testing the currents in the settling hox was half a match, a new piece heing taken at every trial.

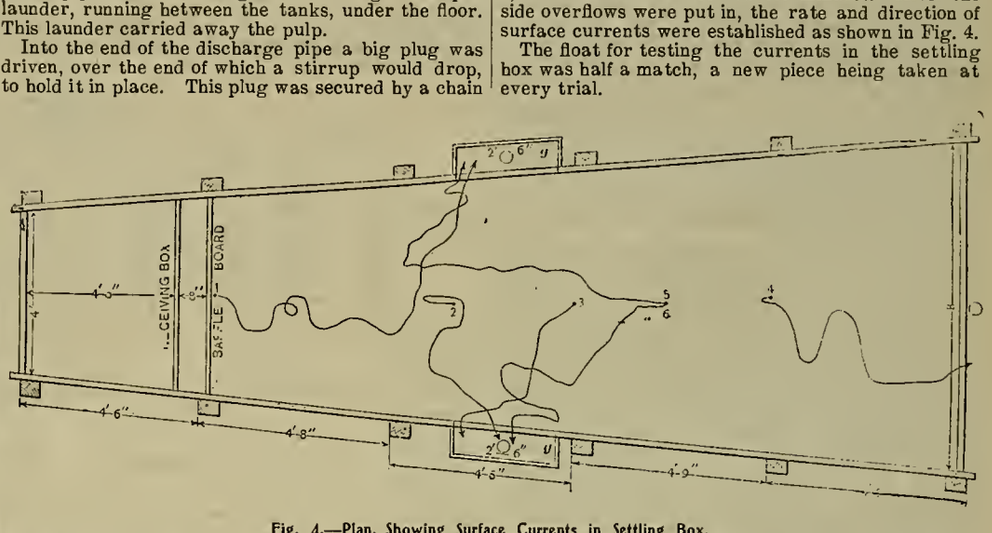

Fig. 4.—Plan, Showing Surface Currents in Settling Box.

No. 1, after many delays and changes in direction, went over the left-hand side overflow in 15.33 minutes. Nearly two-thirds of the time was taken in covering the first third of the distance.

No. 2, after starting for the haffle-hoard, turned hack and, running around the starting point, headed for the right-hand side overflow, going over in 8.25 minutes from the start.

No. 3 started at once for the right-hand side overflow, and went over in 3.25 minutes.

No. 4. started hack towards the head, was stationary a short time, then turned and made its way, zigzag, to the end overflow, going over in six minutes from the start. There was a notable increase in speed within the last 4 inches.

No. 5 started straight up towards the haffle-hoard, hut within 2 feet from the start was caught by a slight draft and carried very rapidly ahout 2 feet farther in the same direction; it then continued in the same course up to the first set of hraces from the baffle-hoard. Here it turned, taking the same general direction as No. 1, and went over the left side overflow in six minutes from start.

No. 6 was a repetition of No. 5. It started straight up towards the haffle-hoard for a little over a foot; there it wavered a moment, and then headed direct for the right-hand side overflow. When two-thirds of the distance had heen run, it started up towards the head and center. When opposite the center of the right-hand side overflow, it headed for this, but gradually swung down stream until opposite the lower end of the side overflow, when it turned hack, and when opposite the center turned and went over, in 5.33 minutes from the start.

The hox was cleaned out every fifteen days, and the accumulated silt on the hottom was found to he rather compact, although soft, after the supernatant solution had been decanted. The accumulated slimes would amount to ahout 1.5 tons; and as 200 tons of solution, more or less, were run through daily, this would make the amount of slimes held in suspension equal to ahout one pound to the ton. By using this hox we were enahled to draw off the settled solution in the agitators much closer than we could otherwise do, and yet send the solution to the zinc hoxes carrying less suspended matter than hefore.

The box had a 4-inch discharge, for washing it out, in the center of the hottom, immediately in front of the haffle-hoard, and a decanting apparatus on one side, within 5 feet of the discharge end. A 2-inch water pipe, entering it over the side, near the haffle-hoard, furnished water under pressure to wash it thoroughly, after the slimes had heen shoveled out.

(TO BE CONTINUED.)

The Use of Petroleum for Power Purposes.

Written for the MINING AND SCIENTIFIC PRESS by W. FORSTNER, E. M.

The discovery of extensive deposits of petroleum on the Pacific coast gives actuality to every investigation tending to its increased use. Petroleum has already to a certain extent replaced coal and wood as fuel under the steam boiler, and is used for the purpose of directly creating power in petroleum engines of all kinds.

The following has heen written to call attention to the use of oil for power purposes in the form of gas in gas engines. The manufacture of oil gas from crude oil and its fractions and its use as motive power in gas engines have been made in Europe, and from the results ohtained there conclusions can he drawn as to the advisahility of their use here.

The first question is: What product can he expected from California oils?

The value of any gaseous suhstance to he used in an engine of internal comhustion, to which type the gas engine belongs, as well as do the gasoline and petroleum engines, depends upon its combustihility and calorific value. There are very little exact data ahout the calorific value of petroleum fractions in general, and of those of California petroleum in special. The chemical composition of the different products of distillation is very seldom given. Generally the chemical data at hand only give the elementary analysis of the petroleum—that is, its content of carhon, hydrogen and oxygen, sometimes nitrogen and sulphur; while petroleum is in fact a mixture of various hydrocarhons.

The calorific value of petroleum can not he calculated from these elementary analyses, as is the case with solid fuel. Prof. Rankine has called attention to the fact that the calorific value of carbon in gaseous form must he higher than the 8080 calories due to that element in solid form. Aydon remarks on this subject in regard to petroleum: "There is a fuel hy nature prepared to the first stage towards gassification. To effect the same result artificially, 3300 calories or more would have to be expended. This heat would become latent and he lost as useful work. Adding these 3300 calories to the 8080 calories derived in converting solid carhon into carhon dioxide, would give the 11,400 calories which Prof. Rankine stated to he the amount due to gaseous carhon."

Applying this to petroleum of the composition: carhon 86.48, hydrogen 7.06, we find:

For solid carhon, calorific value 9390 calories, evaporative power 17.50 pounds of water; and for gaseous carhon, calorific value 12,327 calories, evaporative power 23.00 pounds of water.

On the other hand, carhon does not occur in petroleum in the solid nor in the gaseous state, but in a transitory state hetween the two; hence, its actual heat of combustion lies prohahly hetween the two values ahove given.

Besides, the carbon occurs in petroleum combined with hydrogen into various hydrocarhons, which are readily dissociated by the action of heat, forming other more gaseous hydrocarhons, especially in presence of water vapor, until finally, in case of complete comhustion, the carbon and hydrogen present are all comhined with oxygen. These chemical rearrangements must influence the calorific value of the final result, which can therefore only he determined by experiments on large scale, not hy calculation.

The calorific value of the mixture comsumed in engines of internal comhustion, he it gas and atmospheric air, as in gas engines, or vapors of the lighter hydrocarbons and air, as in petroleum engines of all kinds, is further complicated hy the fact that this comhustion takes place in the presence of a preponderating amount of inert gas, the nitrogen of the atmosphere, which retards the velocity of the gas molecules acting on each other, while hesides interfering with their close contact, in hoth ways decreasing the rapidity and the completeness of the comhustion. It is only reasonahle to suppose that this retarding effect of the inert gas varies with the different hydrocarhons, probably in some ratio to the velocity of motion of their respective molecules.

As the final pressure and temperature of the gas mixture, after combustion in the cylinder, depend upon the rapidity of the comhustion and its completeness, and as these final pressure and temperature control the efficiency of the gas mixture, it is clear that to exactly calculate the theoretical efficiency of the mixture hurned in internal comhustion engines requires data which are not available; hence, we must be satisfied with approximate values.

The manufacture of gas from mineral oils is a well estahlished process. Oil gas has been more specially used for illuminating purposes; still, especially in Germany, a great number of apparatus have been producing fuel gas, of a calorific value at least twice as high as that of coal gas for equal volumes. The relation between illuminating gas and fuel gas distilled from coal is of value in this connection. Some chemists have proposed to interrupt the coal distillation and to separately collect the gas resulting from the first period for use as illuminating gas, and that from the later period of distillation as fuel gas, claiming the latter to be of higher calorific value. This proposition, however, loses sight of the fact that, per volume, hydrogen is a much poorer gas than most of the hydrocarhons, and that a gas wherein the volumetric percentage of hydrogen augments at the cost of the hydrocarhons will lose in calorific value. Mr. Hunt has condensed the results of a very thorough study of this matter in the following tahle, showing that the illuminating value and the power value of a gas are much more closely allied than is generally supposed, and that there is reason to use for the production of power a gas with high illuminative power, the reason heing that the hydrocarhons which contrihute the most to the intensity of the light are at the same time the most important calorific factors:

TABLE I.

Illuminating Power in Candle Power.	Consumption in Cubic Feet Per I. H. P. Hour.	Illuminating Value.	Power Value.
11.96	30.31	1.000	1.000
17.20	22.70	1.435	1.338
26.00	16.26	2.173	1.864
29.14	15.00	2.436	2.020

The following tahle, giving the composition and calorific value of various gases, will further emphasize this contention:

TABLE II.

Composition.	Coal Gas—Volume percentage at 10° C., 760 mm.	Coal Gas—Calorific value per 1 cubic foot of gas in calories.	Oil Gas—Volume percentage at 10° C., 760 mm.	Oil Gas—Calorific value per 1 cubic foot of gas in calories.	Oil Gas Gassified in Presence of Steam.—Volume percentage at 10° C., 760 mm.	Oil Gas Gassified in Presence of Steam.—Calorific value per 1 cubic foot of gas in calories.
Hydrogen, H	52.76	101.16	9.90	18.92	31.61	60.40
Marsh gas, CH_4	32.35	189.04	47.00	274 65	46.17	269.80
Illuminating hydrocarbons	5.49	65.26	37.70	351.38	16.29	151.80
Carbon monoxide, CO.	5.65	10.74	4.00	7.60	0.14	0.27
Carbon dioxide, CO_2	....	....	1.60	....	....	....
Oxygen, O	....	....	....	....	0.73	....
Nitrogen, N	3.76	....	....	....	5.06	....
Total calories		366.20		652.55		482.27

To ohtain a comhustible gas of high calorific power, however, it must not he scruhhed and purified; a poorly purified illuminating gas will be richer than a perfectly purified gas. The mechanical scruhhing of the gas eliminates the ammoniacal products, among which are the carhonates, chlorides, sulphides and cyanides, hesides free ammonia and sulphur, while the chemical purifying eliminates more especially the sulphuretted hydrogen and the sulphohydrate of ammonia, most of which products are combustibles.

Mr. Wirtz made various tests on coal gas with the following results:

	Calories.
Gas coming from the collector	321.25
" " " " condenser	317.15
" " " " scrubber	315.84
Gas entirely purified	303.25

Representing a loss of over 5%.

Practical experience has proven that the heavy hydrocarhons—petroleum fractions of 0.840 to 0.870 specific gravity—give the hest results as regards the yield and the power of the gas.

Lighter oils give a larger quantity of gas and decompose more rapidly; but when crude petroleum, containing much benzine and illuminating oils, is hrought into the retorts, where a temperature of 920° to 1000° C. is maintained, these lighter petroleum fractions are decomposed under regular carhonization, while the heavier oils are properly distilled at those temperatures.

If crude oils have to he used for the production of oil gas, it is preferable to use those not suitahle for illuminating oils; hut with the use of crude oils a heavy residue of graphite must he expected in the retorts.

In Europe the "intermediate oils"—which are those hetween illuminating and lubricating oils, with a specific gravity of 0.840 to 0.860, and a flashing point of 105° C.—are generally used for the production of oil gas. The black and thick residues of the distillation of petroleum have also heen used with remarkahle success.

These "intermediate oils" are more or less equivalent to what are in California called "distillates," which form 16% to 30% of the crude oils. Owing, however, to the latitude used in commercial terms, and the great variety in the different California oils, it is difficult to determine precisely what product is really designated hy the term "distillate." Some cut off the distillation for illuminating oils at 250° C. and for luhricating oils at 350° C; the distillate at 300° C. varying in specific gravity from 0.880 to 0.875; in other petroleums the same is done for illuminating oils at 200° C. and luhricating oils at 300° C., and the distillate at 250° C. varies from 0.844 to 0.810 specific gravity. Again, others give the specific gravity of distillate still lower, at 0.790 to 0.810.

The choice of the oil to he gassified is mainly a question of the price of the suhstance, as the use of crude oils, especially those which carry only a slight percentage of the lighter hydrocarhons, is not sufficiently ohjectionahle to justify the use of a more adequate petroleum fraction, when there is a pronounced difference in price hetween the two.

The various processes for the manufacture of oil gas are all hased on the same principle—a gassification of the oil hy heat, in cast iron retorts, generally lined with refractory material, with or without the presence of steam, the heat in the retorts heing from 920° to 1000° C. The tar vapors are suhsequently precipitated in hydraulic condensers. The capacity of the retorts is from 500 to 800 cuhic feet per hour. The quality of the gas and the numher of cuhic feet ohtained per gallon of oil depend upon the temperature of the retort and upon the rate at which the oil is allowed to enter into it. In fact, every oil requires special treatment to insure the most satisfactory yield and hest gas.

Mr. J. Taylor patented in 1815 an apparatus consisting of two cast iron pipes or retorts, heated in a fireplace, to manufacture gas from mineral oils. A great numher of processes have heen proposed and actually used since, but it would exceed the scope of this article to mention all of them. I shall briefly mention two, representing the two methods, gassification without and in presence of steam.

The Mansfield oil-gas apparatus has heen used extensively. The oil runs in a thin stream through a pipe into the upper part of a vertical cast iron retort lined with fireclay molded blocks. It is vaporized in the pipe, and the oil vapor, passing down into the interior of the retort and coming in contact with its red-hot walls, is decomposed and converted into a permanent gas, which now passes through a standpipe into the hydraulic hox, where the tarry and other condensable products are separated; from there the gas is conducted into the gas holder.

This apparatus makes 1000 cubic feet of gas from 7 to 9½ gallons of intermediate oil. [See later about this production.] Messrs. Crossley Bros. found that in their 12 H. P. nominal Otto engine the consumption of this gas was 10 cubic feet per brake H. P. hour, representing a fuel consumption of 0.07 to 0.095 gallon of oil per brake H. P. hour.

Comparing this with the consumption of oil as fuel under the steam hoiler, we find that in the tests made at the Western Sugar Refinery 0.34 gallon of oil was required per hoiler H. P. hour, representing at least 0.5 gallon per hrake H. P. hour, or nearly seven times as much.

In the Roger's and similar processes the gassification of the oil takes place in the presence of steam. The steam is decomposed and whatever carbon hecomes free during the relations between the various hydrocarhons and the nascent of the steam, combines with the oxygen, forming carhon monoxide, thereby preventing the deposit of solid carbon. The percentage of illuminating hydrocarhons is less in this gas than in ordinary oil gas and its calorific value is smaller; but the reduction resulting from the presence of steam during the gassification is much less than in the case of coal gas.

The following table clearly indicates the different results of the introduction of steam in the gassification process of solid and liquid fuel:

TABLE III.

Constituents in Volumetric Percentage.	Coal Gas.	Producer Gas.	Oil Gas.	Roger's Gas.
Hydrogen	52.75	18.73	9.90	31.61
Illuminating hydrocarbons	5.49	0.31	37.70	16.29
Marsh gas	32.35	0.31	47.00	46.17
Carbon monoxide	5.65	25.07	4.00	0.14
Carbon dioxide	....	6.57	1.60	....
Oxygen	....	0.03	....	0.73
Nitrogen	3.76	48.98	....	5.06
Calorific value in calories per cubic foot	366.20	89.89	652.55	482.27

We see that in the case of producer gas the steam changes the final product from a hydrocarhon gas into a gas wherein carbon monoxide forms the prominent comhustihle; while in the case of oil gas the main difference consists in the decrease of illuminating hydrocarhons and consequent increase of uncombined hydrogen. This difference in the effect of the presence of steam is clearly the result of the different state wherein carhon occurs in the two fuels, which has heen discussed ahove.

In regard to the yield of gas per gallon of oil, it must be noted that when gassifying for illuminating purposes without steam, one gallon yields 90 cubic feet of gas, and when in the presence of steam from 120 to 150 cuhic feet. In both cases a liquid residue, amounting to ahout six gallons per 1000 cuhic feet of gas produced, is left, quite suitable for the manufacture of fuel gas; hence, the yield of this gas can be placed at ahout 140 cubic feet and 250 to 300 cubic

feet, respectively. This amount of 140 cubic feet per gallon is equivalent to seven gallons per 1000 cubic feet, the higher production figure given above for the Mansfield oil-gas apparatus.

These figures indicate another similarity in the relative behavior of coal and producer gas and oil and Roger's gas, respectively. (I use the term Roger's gas here to designate the product of gasification of oil in presence of steam.)

To produce 1000 cubic feet of coal gas requires 222 pounds of anthracite.

To produce 1000 cubic feet of Dowson producer gas requires 13 pounds of anthracite.

4.5 to 5 pounds of anthracite are required per brake H. P. hour, using coal gas.

1.3 pounds of anthracite are required per brake H. P. hour, using Dowson producer gas.

To produce 1000 cubic feet of oil gas requires 7 gallons of oil.

To produce 1000 cubic feet of Roger's gas requires 3½ to 4 gallons of oil.

These figures confirm that the actuating influence of the steam is less in the gassification of liquid fuel than in the case of solid fuel, probably because in the former the carbon is already in an incipient state towards gassification, hence less requires an activating agent. The necessity of admitting air while manufacturing producer gas has also naturally a great influence on the resultant product—a necessity which does not exist when gassifying oil in the presence of steam.

As to the respective fuel consumption of gas engines and petroleum engines—in which term I include all engines using vapors of petroleum fractions—gas engines will not require over 0.07 gallon of oil per brake H. P. hour, while petroleum engines vary from 0.09 to .16 gallon per brake H. P. hour.

The gas plant for a gas combustion engine is entirely independent in its location from the engine plant; it can be erected at any convenient point and the gas piped to the various engine plants without any loss of power. The petroleum engines are small carburetors—that is, they all carburet atmospheric air with vapors derived from the petroleum fractions. Air is readily carburetted, but just as easily loses the hydrocarbons when submitted to friction or low temperature; hence, the carburization must take place in the closest vicinity of the cylinder wherein the product is to be used.

The gas plant gassifies all the oil fed to it, and can use any oil or product, excepting those containing a large amount of light hydrocarbons—preferably the oils which are less in demand for other industrial purposes and the safest to handle.

No excessive claims must, however, be made for engines of internal combustion in comparison with the steam engine. While it is perfectly true that the same amount of effective power can be developed in the gas engine with a much smaller amount of oil than if used as fuel under the steam boiler, yet the engines of internal combustion have other disadvantages which render them less available in practical use than the steam engine for many industrial purposes.

Electric and Compressed Air Mining Locomotives.

Written for the MINING AND SCIENTIFIC PRESS by FRANK C. PERKINS.

It may be of interest to consider the details of some of the leading types of mining locomotives, operated both by electricity and by compressed air, and compare their working advantages and disadvantages, as well as note the principal differences of construction and operation from the steam locomotives in modern practice.

There are various forms of electric locomotives as well as air locomotives constructed by manufacturers in this country and abroad. An electric mining locomotive constructed in Geneva, Switzerland, by the Cie de L'Industrie Electrique, is equipped with two electric motors, which operate upon a circuit of a potential of 500 volts, each motor having a capacity of 12 5 H. P. This locomotive operates upon a track of 60 centimeter gauge, and is one of five employed in the mines of the Societe Franco-Italienne des Houllares de Domhrowa in Pologne, Russia. A double-end Baldwin-Westinghouse electric mining locomotive, designed and constructed at the shops of the Westinghouse Electric & Manufacturing Co. and the Baldwin Locomotive Works, is worthy of note in this regard, as is a single-end electric mining locomotive constructed by the Jeffrey Manufacturing Co., this latter machine being supplied with three electric motors. It has a drawhar pull of 8000 pounds and its total weight is 20 tons. The speed of this outfit is from 6 to 10 miles per hour and the minimum gauge is 36 inches, while the width over all is 61½ inches. The length of this locomotive, excluding humpers, is 12 feet and 2 inches and its height is about 4 feet. The wheel hase is slightly over 5 feet and the diameter of the drivers is 28 inches, and the lightest steel rail recommended to be used with this machine is 50 pounds per yard.

A compressed air locomotive constructed in Pittsburg, Pa., is equipped with 10½x14-inch cylinders, triple tank, and 48-inch gauge. It is a six-driver locomotive and weighs 29,000 pounds. This type of compressed air locomotives is used for not only mining work, but freight service, logging railroads, steel works, and contractors' use in new plants under construction.

In the present state of the art power can not he transmitted to as long a distance hy compressed air as it can by electricity, the economy of electrical systems of power transmission being greater than that of compressed air systems as great distances increase. For local work for haulage in mines and switching locomotives in manufacturing plants, the compressed air locomotive is claimed to be as efficient as the electric locomotive, and in many ways has decided advantages over the electric locomotive, particularly when heated air is used in the motors is the efficiency materially increased.

It is asserted by engineers familiar with compressed air locomotive working that, compared with electric haulage, compressed air haulage is simpler, more reliable, and is not subject to breakdowns and interruptions, and that it is absolutely safe in gaseous mines, where electricity is as dangerous as steam. They also suggest that it is more flexible and convenient, inasmuch as the compressed air machine is complete in itself, able to reach all parts of the mine, wherever a track is laid, without requiring an overhead trolley line.

The electric storage battery mining locomotive is now being extensively used, and it is claimed for it that it has similar advantages over the trolley mining locomotive that the compressed air machine has. The item of maintenance and repairs is claimed to he greater for the storage battery locomotive than the compressed air outfits, and the latter are said to be far more economical than the steam or even the trolley electric haulage systems, as the tanks and connections are practically indestructible and the wear largely confined to valves, wheels and brasses. By heating the air it is said the increased efficiency is about 40%, as far as the economy of coal is concerned. An air locomotive when charged can travel with its load of several cars to the end of the run, and any stoppage of the air compressor does not tie up the system in any way, as would happen with the trolley system if the main generator were to be laid up for repairs.

In special, hazardous applications, where great care must be taken to avoid explosions or fire, the air locomotive is far better than the steam-driven outfit, as is also the electric-driven locomotive, the latter, of course, not being so safe as the former where gases are liable to be ignited. Air, being a perfect gas, is said not to have losses of condensation like steam, although there are losses, during expansion, from contraction due to fall in temperature.

The compressed air locomotive is constructed on about the same lines as if operated hy steam, so far as the machinery is concerned, the frame, valves, cylinders and mounting being very similar, the storage air tanks taking the place of the steam boiler. Very high pressures are used, as compared to steam locomotives, the most economical air pressures being not less than 700 pounds nor more than 900 pounds. The factor of safety of the tanks is quite large, the plates used having a tensile strength of about 60,000 pounds per square inch.

Before entering the working cylinders the air passes from the main tanks to an auxiliary cylinder or reservoir through an automatic reducing valve, which lowers the pressure to 130 pounds or 150 pounds, as desired. The constant working pressure of 140 pounds is maintained as long as the main tanks are charged with air above this pressure. The air passes from the auxiliary reservoir through a balanced valve to the valve chests. The auxiliary reservcir is usually constructed of wrought iron piping about 9 inches in diameter and 12 feet long, and serves to relieve such fluctuations in pressure as the operation of the engine may cause, aud provides a uniform working of the reducing valve mechanism. The usual locomotive Stevenson link motion controls the distribution of air in the cylinders, the air being used expansively.

The cost of operation has been found in several cases to be from 1 to 1½ cents per ton mile, including all expense, interest and depreciation of plant, varying with the character of the rolling stock used. The depreciation on the air locomotive is very low, there heing no boiler to wear out, and the tanks, having nothing to corrode them excessively, when well painted, wear almost indefinitely.

Compressed air haulage has much to recommend it, heing cheaper than rope haulage in many cases, and under many conditions is superior to electric locomotives, either operated by trolley or storage batteries.

Without a douht hoth the electric locomotive and the compressed air locomotive have each a field of their own, and there are many cases where one has advantages over the other. A great many mining electrical engineers dispute the claim of increased economy, flexihility and reliability for the compressed air locomotive over the electric method of propulsion, although it cannot he douhted that in cases where dangerous gases are to be found in mines the sparks from the trolley contacts are dangerous, and even with the storage battery mining locomotive the sparking at the commutator may produce as serious results from explosion as that of the trolley sparking.

Electricity is without douht a most convenient and economical form of motive power for mine haulage, and certainly in frequent cases has marked advantages over the compressed air system. As regarding compactness, the electric locomotive has slightly the advantage as to size for a given output, but the general operation of compressed air machinery in mines supplies a large amount of air available for ventilation, which is well worth consideration, especially if a large number of cutting tools, drills and motors are in continual operation.

The electric locomotive is perfectly adaptable to low and narrow entrles, and there are no moving parts exposed to external injuries, while the mechanism is of the simplest character. The running parts are readily accessible and the cost of maintenance exceedingly low. The electric system of propulsion will compare favorably with any existing system, particularly if other motors are used on the circuits for operating mining machines, pumps, ventilators, etc., and a common source of supply may he utilized for furnishing not only the necessary power for driving the machinery, hut for lighting the mine passages as well. Where the same generating plant can supply the necessary current for not only lighting with incandescent lamps, but working the hoisting and drilling apparatus, as well as the electric locomotives, the greatest economy is obtained. The electric system is far more efficient than the air pressure system, if the distance to which the power is to he transmitted is any great distance or the mining operations extend over a very large area, and a number of shafts are necessary, located considerable distances apart.

The electric mining locomotives are seldom called upon to operate at greater speeds than 6 to 10 miles per hour, and are usually designed to he able to develop their full load tractive effort at the former speed. The weight of train which a given electric or air locomotive will haul at standard speed on a straight track will vary according to the grade and the frictional resistance of the cars. The frictional resistance varies according to the condition of the track and the condition of the car and locomotive journals, ranging from 20 pounds per net ton weight to 80 pounds. Even the latter figure may be exceeded where the wheels of the cars are hadly worn out of true and scrape against the sides. The storage battery mining locomotives are designed hoth with the batteries mounted on top of the locomotive and also with the batteries mounted on a separate truck, the latter being used to transport material in mines where the vein is too thin to allow the locomotive to he used which has the battery upon the top of the frame. The battery locomotives have a full load running drawbar pull of 100 pounds, and on clean, dry tracks will develop even more, the rate of speed heing 8 miles per hour. The locomotives are usually supplied with trolley poles and connections as well, so as to he able to operate from the trolley line and have the batteries under charging current at the same time.

Electrical underground haulage systems are being rapidly introduced in mines in Europe and America, the electric locomotive having been found well adapted to this work where the grades are not too excessive, electrical hoisting and rope haulage systems being often adapted where the grades preclude the use of the locomotive. Steam, compressed air, rope—and even mule—haulage each has its special field, for which no other system is so well suited.

The steam locomotive has only the advantage of heing cheaper in first cost, while the depreciation and maintenance are high, and the bad effects of heat, smoke, gas, steam and sparks are very objectionahle, practically shutting out this class of locomotive for mine haulage.

The compressed air, rope and electric systems are most extensively used, the air heing well adapted to mines with gases, which are dangerous on account of explosions, and the rope system is preferable when the grades are excessive.

OWNERS of lands in the Joplin, Mo., lead and zinc district usually grant a first lease at 10% or 12½% upon tracts of from 20 to 80 acres. The lessees proceed, in most cases, with drills to prospect the land, which has been divided in tracts of 1 acre, known as a "lot." A sublease of four to six or eight lots is granted to another lessee, frequently upon the tracts upon which prospecting has been done, and this lessee proceeds to sink a shaft and open up the ground, usually paying from 15% to 20% royalty upon all mineral sold from his lease. Such improvements in hoisting and milling machinery as may he needed to properly handle the ore are made at the expense of the sub-lessee and remain his property. Leases hold for a term of years—usually ten—and, by their terms, operations must not be ahandoned for more than thirty days without the written consent of the first lessee or owner of the land, under penalty of forfeiture. As a result, a man possessed of a small grub stake in the past has been able by his diligence to develop excellent prospects. Resulting from this system, large acreage is developed at practically no cost to the owner of the land, and his royalties, paid weekly as sales are made, afford him a handsome income from productive ground. The system is the result of years of experience, and, while exceedingly simple, affords ample security to the fee owners, and at the same time gives to the mine operator all that is his due.

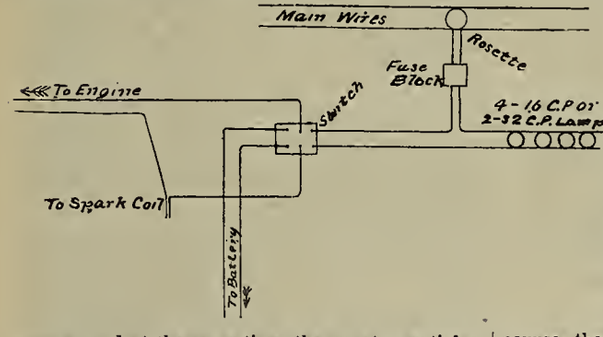
Gas and Gasoline Engine Ignition.

By Albert Stritmatter.

In the operation of a gas engine if there is any one thing which causes more trouble than another, it is probahly the igniter. All successful gas engines are now operated upon the principle of ignition of the explosive mixture under compression and at a certain point to give the greatest power possihle. An engine may he a perfect running machine with the exception of the igniting mechanism; hut, if this fails, the whole thing is as good as nothing. This is prohahly the most vital part of a gas or gasoline engine, for, if it is not effective, the engine is no better than so much scrap iron.

In considering this question let us first consider the different methods of ignition. There is one method which, while not a very satisfactory one, was put out on a very large numher of engines a good many years ago and there are a great many of the engines still in use. At the head of the engine was a sliding hlock of steel or iron. In it was a small hole ahout 1 or 1½ cubic inch in size. This slide would pass over a gas pipe and the small hole would he filled with gas and air. It then passed hack across the head of the engine, and in doing so the pocket passed a lighted gas jet or pilot light which ignited the gas in the pocket. As the slide moved on, the gas continued to hurn, and finally the pocket came to an opening which led into the cylinder. The device was so timed that this pocket of hurning gas reached the opening leading to the cylinder at the end of the compression stroke, thus causing ignition at that time. For various reasons this method of ignition proved unsatisfactory, although, as hefore stated, there are still a great many of the old engines employing this system still in use.

One of the methods of ignition commonly used at this time is that hy means of a hot tuhe. In this method a tube is placed on the engine and the explosive charge is compressed into it during the compression stroke of the piston. At the proper time the charge is ignited hy the heat of the tuhe, which is heated on the outside hy means of a gasoline hurner or gas jet. Several kinds of tuhes are used, the most



common, and at the same time the most unsatisfactory, heing the ordinary iron tuhe made of hlack pipe of ahout ⅜ inch or ½ inch diameter, and closed at one end. Porcelain is also used, hut prohahly the hest suhstance for the purpose is nickel steel.

The ohjection to this method of ignition is that it is affected by so many conditions which are not under the control of the operator and which vary from day to day, so that it is unreliahle. The iron tuhes oxidize and hecome scaled on the inside, delaying the ignition, and finally hurst through, necessitating a new tuhe. Although the tubes cost hut 3 or 4 cents a piece, the loss of time in putting in a new one is often considerahle. Where the engine is so located that there is a draught of air to play on the hurner which heats the tuhes, the flame is continually hlowing hack and forth and the tuhe is not kept at the same heat. This makes the hot tuhe very unsatisfactory for portahle use, and where there is any danger from fire it is also unsatisfactory. Atmospheric changes continually occur and affect the time of the ignition, so that it is constantly varying. As the maximum pressure produced is in proportion to the compression, it is essential that ignition take place at the point of greatest compression, and not after the piston has started to move forward, and thus reduce the compression. The exact point of ignition with a hot tuhe can he told only hy an indicator card, which few people are prepared to take even once in a while, let alone every day, and then make the tuhe to suit the conditions. The result is that engines using this type of igniter use too much fuel a part of the time and a part of the time give less power than is possible, simply hecause the ignition is not taking place at the proper time and regularly.

But hy far the most common method of gas engine ignition is by the use of electricity in some form or other. There are a number of plans of doing so. First, there is the "make and break" method. In this method two electrodes or arms are hrought together on the inside of the cylinder. One of these is stationary and is insulated with mica or other suhstances. The other electrode is movahle. The two are connected on the outside of the engine to a hattery and spark coil. At the proper time on the compression stroke, the two points are separated and a spark jumps hetween them as they separate, making the ignition. In order that this method he successful the hattery must he strong, the spark coil must he as short as possible and effective, the insulation of the stationary electrode must he perfect, and the igniter points must he free from carhon or rust which may partially or entirely insulate them. A large numher of materials are used for the igniter points. Platinum is very common and is hard, hut it is expensive and often honeycomhs in short time, spattering the spark. German silver is often used, hut is soft. Ahout as satisfactory a method as I know of is to use hard steel for hoth points, or German silver on the stationary electrode and hard steel on the movahle. In Mexico, where peculiar conditions of climate and fuel are met, one user reported that he secured the hest result by using a steel point on the movahle electrode and on the insulated electrode a point made of 75% silver and 25% copper.

Then there is the "wipe spark" method. In this plan one of the electrodes usually consists of a flat steel spring, which is ruhhed slightly on the stationary electrode hefore separating from it and causing the spark. This ruhhing motion is intended to keep the points free from rust or deposits of carhon. It is objectionahle, however, on account of having a spring in the comhustion space subjected to a very high temperature, which is likely to spoil the temper of the spring. The igniter points also wear very rapidly under the chaffing section.

The "jump spark" method is hecoming more and more liked, especially with automobile manufacturers. The principal advantage of this method is that there are no moving parts inside the cylinder, hut the "points" are placed stationary a short distance apart. The current is made and hroken outside of the engine cylinder, causing a spark to jump across the two points. Its main objection is that the carhon deposits on the points vary rapidly, causing cleaning of them to he necessary very frequently.

Further, there is the method of using a sparking dynamo or magneto, or of taking current from an electrical generator which may he used for producing lights or running machinery. These are more or less similar, hut with the sparking dynamo it is necessary to use a battery in order to start the engine. But after the engine is in motion the hattery can he cut out.

The method of connecting up to a general commercial current is not commonly understood, and the sketch given herewith illustrates the methods employed. As will he noted, the wires are not connected up hack of the lamps, in order to shunt the current through the lamps and reduce the voltage. It is best to use a hattery with a douhle switch, as indicated, so that the hattery can he used in case of a shut down at the central plant. Or, in cases where the current is from a generator run hy the engine, it is necessary to have the hattery in order to start the engine. Of course, the hattery is cut out after the engine is started, and it therefore lasts a long time without renewing.

Where a hattery is used in any of the methosp named, it must, of course, he only of the best. Automohile users find it convenient to use a sal ammoniac hattery, as the renewals can be secured at any drug store or the supply can easily he carried along. Still, if the hattery happens to need renewing on the road, it is necessary to wait for the solution to cool, and in preparing it one is suhjected to a certain amount of inconvenience, such as getting it on the clothing, etc. One enthusiast has to admit that, in spite of the convenience, the "stuff spoils his tan shoes."

For ordinary power purposes, however, the sal ammoniac hattery does not answer. In the first place, it does not give a strong enough spark, and, in the second place, runs down too soon. While the renewals cost but little, much valuahle time is often wasted if the battery gives out unexpectedly.

Dry hatteries are frequently used and with good results, especially for portable work. The difficulty with them seems to be that they are not standard. Sometimes one will give out in a few days, while another, taken from the same shipment and suhjected to the same tests and given the same care, will last for months. This is true to a certain extent of the liquid hatteries also. I know of some of these which have heen in constant use on small engines running at high speed and on full load, where the hattery seems to be as strong as it was two years ago when put in. These are exceptional cases, however, and even the hest hatteries can not ordinarily he expected to last more than six to eight months under average usage. A battery may he compared to a hucket of water. If you take a drop out every second for ten hours a day, and continue to do so every day, the water supply will not last as long as if you take out a drop but once every half minute for eight hours a day. In other words, if a hattery is used day in and day out for ten hours a day, it will deteriorate sooner than if run seven or eight hours only two or three days a week. Small engines run at a higher speed than large sizes and therefore require more explosions per minute, so that they draw on the spark supply more than large engines. Engines on full load also require more explosions per minute than those on light load, i. e., in the "hit and miss" type. Therefore, it will he seen that throttling engines (which take a charge continuously), or hit and miss engines which operate the sparker continuously whether a charge is taken in or not, both run a battery down quicker than hit and miss engines which cut the sparker when a charge is not heing taken in and exploded. It is also seen that the amount of load on the hit and miss engine and the speed at which an engine is run affect the life of a battery.

In cold weather it often occurs that the operator does not know how cold a temperature a liquid hattery will stand without freezing or heing injured. The manufacturers of a make of battery which is very largely used for gas engine purposes state that the sealed liquid hattery which they recommend for portahle use will not stand as low a temperature as the hattery for stationary engines. The sealed hattery, so they state, can he exposed to a temperature of zero F. without the solution congealing. The other hattery, however, will stand as low as 15° to 20° helow zero without freezing. They state that "the availahle current from the hattery diminishes as the temperature falls, and this is especially noticeable helow zero. This decrease in current output is due to the increase in internal resistance, which rises inversely as the temperature falls.—American Manufacturer.

The Cyclone Pulverizer.

The accompanying illustrations show a new form of pulverizer, and also a new fine grinding mill or disintegrator, which is heing introduced in this country hy E. H. Stroud & Co. of Chicago as agents and manufacturers in the United States, Canada and Mexico for the Central Cyclone Co. of London, England. These machines, it is claimed, are especially adapted for service where uniform work and fine grinding are required, and will do especially good work on gold, silver, copper and lead ores which have to he ground fine, also on gypsum, graphite and in preparing powdered coal fuel.

Fig. 1 is an outside view of the pulverizer, while Fig. 2 shows the disintegrator with the cover raised to illustrate the construction of the machine. It is stated that the pulverizers can he "set" to make any particular fineness of powder and the machine

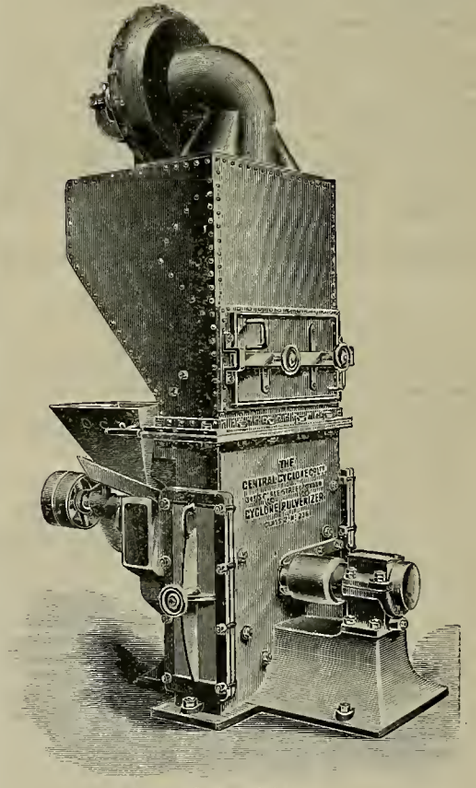


Fig. 1.—Cyclone Pulverizer.

will not only grind the material, hut will also automatically separate the ground product and deliver only such a uniformly fine product that hetween 90% and 95% of it will pass through the mesh desired.

In grinding, the heater arms drive the material round at considerable speed and heat it hetween themselves and against serrated plates of hardened metal (especially made for this mill), with which the sides and periphery of the mill are lined, until it hecomes small enough to fall through the screen or grating of a disintegrator, or to he carried off hy the air current in a pulverizer, as the case may he. The rotating star or mill wheel is, hy reason of its high

velocity of rotation, under considerable strain, but the manufacturers claim the design of these mills is such that the maximum per square inch can not exceed 3300 pounds. The speed of these machines varies from 4000 revolutions per minute in the small-

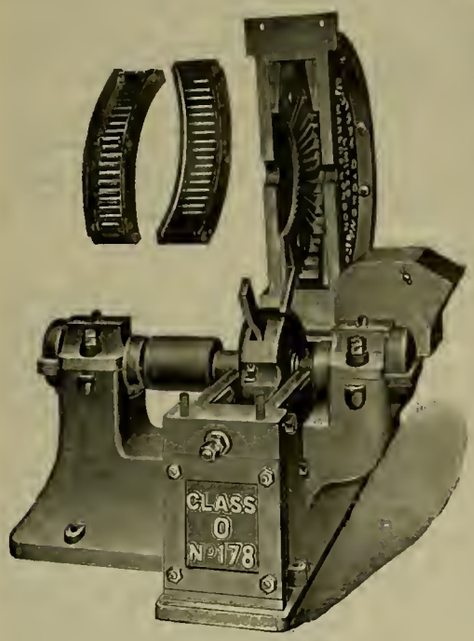

Fig. 2.—Cyclone Disintegrator.

est size to 1200 in the largest size, and the rim velocity of the grinding wheel is from 15,000 to 19,000 feet per minute.

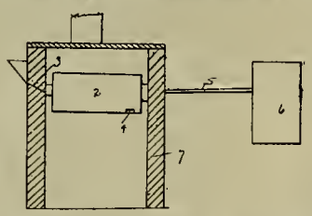
The two machines work on the same principle, but the disintegrator discharges through an adjustable grating or screen in the bottom of the mill, while the pulverizer is provided with a separation hood and an exhauster, the fine particles being separated and carried off by the air current, when reduced to the required size.

Mining and Metallurgical Patents.

Patents Issued February 25, 1902.

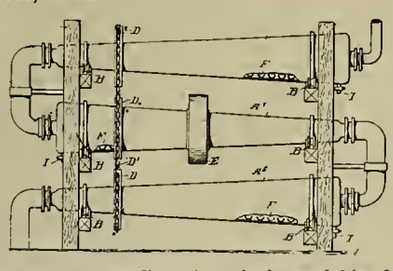
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

PROCESS OF REDUCING CARBONACEOUS ORES.—No. 693,982; R. McKnight, Philadelphia, Pa.



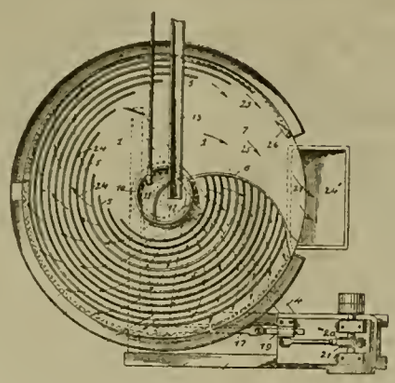
Heating the ore in presence of sulphur, until carbonates are converted into sulphur compounds, and continuing heating in presence of a haloid salt of an alkaline or alkaline-earth metal, with access of air, until alkaline metal or alkaline-earth metal combines with sulphur and with oxygen to form a non-volatile sulphate of alkaline or alkaline-earth metal, and liberated halogen unites with precious metal, as a haloid salt or an oxyhaloid of precious metal, and volatilizing and collecting haloid or oxyhaloid salt.

AMALGAMATOR.—No. 694,201; J. R. Sawyer, Arroyoseco, N. M.



A frame, a plurality of conical revoluble drums mounted one above the other in frame with ends projecting beyond same, axes of drums being in horizontal planes and drums being arranged with base end of one opposite apex of drum below, means for revolving drums in unison, cups on inside of drums and adapted to contain mercury and arranged to discharge mercury upon material as drums revolve, means for feeding material into projecting base end of uppermost drum, and stationary pipes connecting ends of drums outside of frame, each pipe leading from apex of one drum to base of drum next below.

ORE CONCENTRATOR.—No. 694,005; W. G. Dodd, San Francisco, Cal.

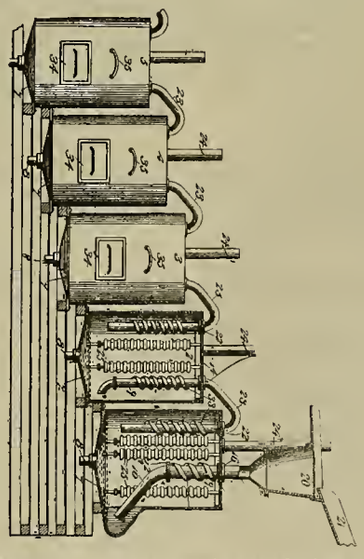


Cone-shaped table mounted to oscillate around a central vertical axis, a plain or unriffled portion to table, a pulp and water distributing box arranged to distribute pulp and water at apex of cone, a series of downwardly inclined curved riffles arranged on working face of table and extending onto plain or unriffled portion, discharge end of each riffle being beyond that of riffle immediately above, and means whereby an oscillating motion is imparted to concentrating table.

BLASTING FUSE.—694,271; N. Harris and J. Bray, Russell Gulch, Colo.

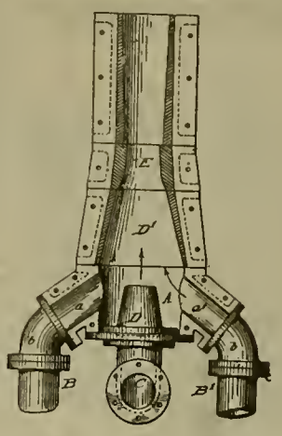
A cord-like combustible member adapted to be cut into arbitrary lengths and provided with ancillary combustible members for igniting it, ancillary members being of tapering form for purpose of enabling them to be readily folded against cord-like member without breaking, ancillary members being disposed at definite intervals on cord-like member.

FINE-GOLD AMALGAMATOR.—No. 694,290; M. Lasswell, Spokane, Wash.



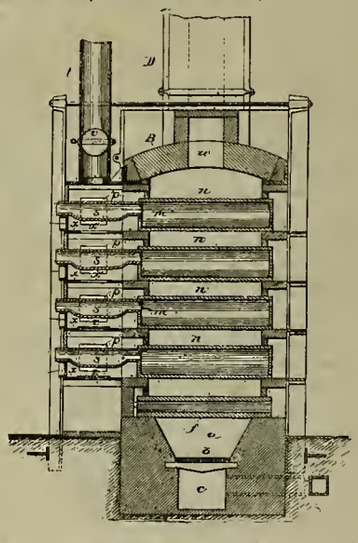
A stationary container having a sloping bottom which provides a mercury chamber in its base, an inlet pipe provided with curved nozzle adapted to discharge water, sand and gravel laterally in one direction against wall of container above surface of mercury so as to cause water, sand and gravel to rebound in opposite direction over surface of mercury, avoiding agitation of latter, an outlet pipe, and spiral amalgam plates encircling inlet and outlet pipes.

MINING ELEVATOR.—No. 694,002; H. W. Davis, Auburn, Cal.



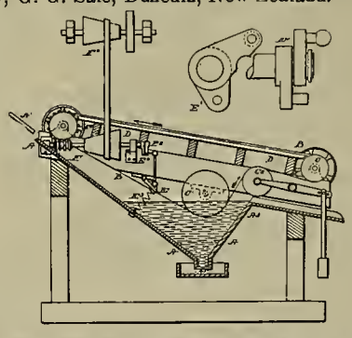
An exterior casing formed in sections placed end to end, and each section formed of a plurality of arc-shaped parts placed edge to edge, and all formed with vertical ribs and horizontal flanges, whereby they are secured together to form a connected tubular structure, an inner lining composed of a number of single-piece tubes abutting end to end and held inclosed by exterior sectional casing, a base section in two parts, each being formed with halves of two suction passages, abutting ribs by which halves are secured together, an upper flange by which base section is connected to lower casing section, flanges on suction halves by which they are connected to suction pipes, and an injector entering base section.

ZINC FURNACE.—No. 694,137; G. G. Convers and A. B. de Saulles, South Bethlehem, Pa.



A retort chamber for circulation of products of combustion, a plurality of retorts or muffles arranged in vertical series within chamber, a cooling flue chamber common to all retorts and adjacent to vapor discharge openings of retorts, zinc condensers extending through cooling flue chamber, and means for creating a cooling draught through flue chamber.

CONCENTRATOR FOR GOLD BEARING MATERIAL.—No. 694,199; G. G. Sale, Dunedin, New Zealand.



A concentrator employing an endless belt, a beater mechanism for belt, comprising a frame, a horizontal shaft carried by frame and adapted to rotate belt, means to transmit power to shaft, a rigid crank mounted upon shaft near its end, a loose crank mounted upon end of shaft and adapted to be tilted at each revolution of shaft by rigid crank, a rod connected to loose crank, a pivoted flapper connected to under side of frame and also to rod, said flapper being adapted to be raised at every revolution of shaft, and a spring for returning flapper, rod and loose crank with a sudden jerk to beat the belt.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

KETCHIKAN.

A. O. Hellan of Seattle, Wash., has bonded from C. R. Barton twenty-three quartz and placer claims on Hastings Arm, a branch of Portland Inlet in southeastern Alaska, at $125,000. The quartz ledges are said to be wide and to assay well. The bond covers several tracts of placer ground, the prospecting work on which is said to make a paying showing.

At the Sea Level mine at Sealevel, near Ketchikan, the mine buildings are all complete and ready for the mill and hoisting machinery, which, including the pipe for the water power, is reported to be on the way. The right of way for the power pipe line has been cleared. Work in the triple compartment shaft has been suspended until the hoisting machinery can be put into operation.

ARIZONA.

GRAHAM COUNTY.

Work has been commenced on the Mercer tunnel at the head of Pinto and Mineral creeks, near Clifton, and is expected to continue without interruption until it is in 2000 feet. Work on a mile of wagon road to the tunnel has been started. W. H. Mercer is Supt. and J. A. Valentine is his assistant.

H. Setzer of Bridgeport, Conn., president of the Stevens Copper Co. at Clifton, has bought from B. M. Crawford and J. F. Nicholls several claims which have been added to the Stevens group. C. L. Stevens, one of the original owners of the group, is Supt. It is the intention to push development rapidly. An electric power plant is under contemplation.

MARICOPA COUNTY.

The Copper Bar M. Co. in the Buckhorn mining district, near Wickenburg, has bought a group of claims with several veins of high-grade copper and gold ore. The veins vary in width from 3 feet to 20 feet and all carry chalcopyrite. The president, G. M. Cake of Los Angeles, Cal., has arranged for road building and machinery to operate the mine. Shipments will be made to Wickenburg.

The Socorro mine, near Wickenburg, is being worked by Hartford, Conn., people, incorporated as the Socorro G. Co., with Mr. Wetherly as manager. The developments consist of a 300-foot shaft and 400 feet of levels. The company is about to put in a 20-stamp mill, a hoist and a pump of 18,000 gallons capacity, the latter to bring water through the 3-mile pipe line from Centennial. Mr. Wetherly proposes to work all the tailings by the cyanide process. The expenditure already made is said to be $20,000, and when the plant is in place $100,000 will have been paid out.

B. O. Hatfield has sold his one-sixth interest in the Oro Grande mine at Wickenburg to his partners, G. E. Lamb, F. W. Ellis and G. B. Upton, for $100,000.

The Denver Group G. & C. Co., at Wickenburg, has its tunnel in 450 feet, and additional contracts will be let to continue it until the ledge is crosscut. A. H. Gamage is Supt.

MOHAVE COUNTY.

At the Sheeptrail mill, near Kingman, Supt. Bagg has made a test run of seventy-five tons of $10 a ton ore, recovering $6 a ton from the plates and battery. A cyanide test is now being made on the tailings. The company will probably install a cyanide plant. An estimate of the cost of mining, hauling and milling is given at less than $3 per ton.

H. A. Cohen, representing Capt. De Lamar, has made arrangements for the starting up of work on the Ben Harrison and Tom Reed mining claims, in the Hilty group, near Kingman. One shaft will be sunk at once and later another shaft will be commenced. E. Hilty is Supt.

The Philadelphia & Arizona M. Co. will sink the main shaft of the Minnesota mine at Chloride to the 500-foot level to obtain water for the mill. Supt. Loy is to rush this work.

YAVAPAI COUNTY.

The Crown G. M. Co. has bonded the Alma mine on Groom creek. The company is composed of W. P. Rice and associates of Los Angeles. Supt. Mansfield is installing a 35 H. P. boiler, a gallows frame, pumping plant and other machinery, and has let a contract to sink the first 100 feet of a 500-foot shaft.

The new shaft in the United Verde mines at Jerome is about 10x30 feet in the clear, with three compartments, strongly timbered from the top to the 700-foot level. It is connected by drifts with each level, through which electric trams will convey the ore to the cages. The surface equipment will be a high-speed hoist with a capacity of hoisting from 2000 to 3000 feet depth. The gallows frame will be of steel.

Supt. Pickrell is reported to have the shaft down 350 feet on the President group, and has kept a 10-stamp mill steadily at work on ore taken out in development work alone. The mine is located in Hassayampa district, near Prescott.

J. Phillips has bonded his group of three quartz claims in the Hassayampa district, near Prescott, to a Mr. Standish of Los Angeles for $25,000. The development work has been done on a ledge 10 feet wide, ore from which gives assay values of from $7 to $11 a ton gold. It is stated that Mr. Standish will immediately commence work on a tunnel which he will drive in 1200 feet.

At the El Capitan mines at Bigbug, being operated by Douglas, Lacey & Co., a shaft down 40 feet shows ore in the bottom that carries 21½% copper, in addition to other metal values.

The Copperopolis group of seven claims owned by E. W. Fisher of Briggs, Ariz., is situated in the Castle Creek mining district. A lode has been opened which is from 60 to 100 feet wide. It is low grade, but carries shoots giving values in gold from $10 up and copper from 10% up. On one shoot there is a shaft 200 feet deep equipped with a 12 H. P. gasoline engine and a Cornish pump. The mine water carries considerable copper in solution.

CALIFORNIA.

AMADOR COUNTY.

Work on the twenty additional stamps of the Central Eureka mill at Sutter Creek is expected to be completed by the middle of April, when the entire forty stamps will be started up on the accumulated ore.

At the Wildman-Mahoney mines at Sutter Creek the Wildman shaft is now retimbered and repaired nearly to the bottom. Good ore is being taken out from some of the upper levels. Sinking is now in progress at the Mahoney shaft, which is down something like 1200 feet. J. Ross is Supt.

At the Lincoln mine at Sutter Creek the main shaft is now down 1870 feet. It is estimated that it will take about two months more to complete the sinking to the 2000 level, where a station will be cut and a crosscut started west for the vein.

Some very good ore has been found in the Oneida mine at Sutter Creek on the 1850-foot level. The 60-stamp mill at this mine is crushing from 9000 to 10,000 tons per month.

In the Bay State mine, near Plymouth, the vein which the shaft follows has been struck about 80 feet east of the 750-foot station. The ore bin at the mill is being filled with rock from this new discovery and the 10-stamp mill is to be started up. Power drills are being used. J. Ross, Jr., of Sutter Creek, is Supt.

CALAVERAS COUNTY.

The Parnell mine, at Smith's Flat, owned by H. S. Messer of Altaville, after lying idle for twenty years, is being operated under bond by a San Francisco party, and workmen are now engaged in pumping out the water from the shaft.

The Bradley & Osborne mine, situated near Altaville, has been bonded to San Francisco people. There is a tunnel on the vein for 300 feet and a shaft down 90 feet. Work has been resumed and the main tunnel is being extended farther.

EL DORADO COUNTY.

At the Zantgraf mine, near Auburn, the main shaft is being retimbered, and when completed it will be sunk 250 feet farther, to intercept the contact of the Montauk and Zantgraf ledges. The rebuilding of the mill is postponed, but a new air compressor and hoist have been installed on the mine.

Sulphurets from the Mt. Pleasant mine, at Grizzly Flat, are being shipped to the smelters.

A 10-stamp mill has been built at Georgetown for J. H. Moore, who proposes to do custom work and test the ores of the various mines in that vicinity.

MARIPOSA COUNTY.

A. P. Dron of the Nonpareil M. Co. of Mariposa and the Merced M. Co. are reported to be arranging to bring in the Golden Rock Water Co.'s ditch to insure a supply of battery water all the year around to both mills, while the Nonpareil would probably be run by water power.

NEVADA COUNTY.

The Grass Valley Con. M. Co. is planning to install a telephone and electric lighting system in the underground workings of the mine at Grass Valley, and for the installing of a four-drill compressor plant. Every station in the shaft will be fitted with a telephone box. The landings and all the main parts of the workings will be lighted by electricity.

The Eagle Bird mine at Maybert is to be worked during the coming summer. W. L. Raeder of Wilkesbarre, Pa., one of the large owners and president of the company, visited the mine and stated that it is the intention of the company to start in a short time. W. M. Wilson will continue to act as Supt.

The New Independence Quartz M. Co. has been incorporated in San Francisco, capital $250,000, with C. M. Root, R. M. Dunne, W. B. Simmons, F. E. Harmon and R. J. Simmons, Jr., all of San Francisco, as directors. Under the superintendency of C. M. Root, the company is developing under a bond the Independence quartz mine, situated near Wolf.

At the Home mine, at Nevada City, thirty stamps are at work. Fifty men are employed. A depth of 700 feet has been reached in the shaft. D. J. McFall is Supt.

At the Eclipse mine, on Gold Flat, Nevada City, Supt. B. Hosking has sunk the shaft about 60 feet, making a depth of about 350 feet. In the bottom the ledge shows about 15 inches wide, and it is estimated that some of the ore will yield as high as $60 to the ton.

H. K. and D. T. Hedges of San Francisco have been preparing to build a custom cyanide plant on Deer creek, near Nevada City.

The Brunswick mine incline at Nevada City is down 1275 feet, and a station is being cut. From there the drifts will be run to tap the ledge and the pay shoot which was in evidence in the levels above. Supt. Mallen is pushing the work.

Canfield & Co., who are opening up gravel property on Shady creek, near Nevada City, have completed the work of constructing a large dam to store water. Large quantities of debris are being removed preparatory to reaching virgin ground, which it is believed will pay well.

The Hackett M., M. & Dev. Co. has been incorporated, capital $75,000, to operate mines, erect electrical works and dispose of power, with the place of business at San Francisco. The directors are J. Hackett, J. E. Ellis, A. M. McGill, C. Man and A. Barnard, all of San Francisco.

PLACER COUNTY.

The Big Gun hydraulic mine, at Michigan Bluff, has commenced operations.

The new company at the Black Canyon quartz mine, at Westville, will erect a 20-stamp mill. J. Ruiz has taken the contract to freight it from Washington, Nevada county, to Black canyon.

SACRAMENTO COUNTY.

W. Murdock of the Gray Wing mine, at Folsom, says the mine is richer than ever. They have 16 feet of gravel and a 150-foot crossdrift shows no signs of rim rock.

SAN DIEGO COUNTY.

J. F. Delgado, M. E., of this county, has taken a bond from A. W. Pray, J. R. Upton, S. T. Case and H. H. Case of Escondido to the Palagonite stone mines, near Escondido. It is said that the mines contain valuable deposits of a particular kind of stone, which is found only in one or two places in the United States.

SIERRA COUNTY.

Gravel has been struck in the Belcher mine at Monte Cristo, near Downieville, after raising 112 feet. The gravel is encountered on the west rim of the channel and the bedrock is pitching toward the east into the hill. The tunnel is in about 725 feet. The gravel prospects well. The property is owned by the Fir Cap Con. M. Co. of San Francisco, W. J. Belcher manager; J. Erwin is foreman.

SISKIYOU COUNTY.

The Portuguese Co., at the head of Greenhorn creek, near Yreka, has discovered a 14-foot ledge, with quartz averaging from $6 to $8 per ton.

The Boyle quartz mine, in Humbug, near Yreka, it is reported, is to commence operations again, after being idle for several years. This mine is equipped with a 5-stamp Huntington mill. It has changed ownership recently.

The Blue Ledge, about 30 miles south from Medford, Or., is a low-grade proposition, assaying about 5% copper, with $4 in gold and silver. The size of the ore shoot on the surface is claimed to be enormous. A drift has been run 160 feet, and a crosscut has been driven for about 26 feet, both all in ore. To operate the mine it will be necessary to build 35 miles of railway to it at a cost of $350,000, and a smelter will have to be built to treat the ore at the mine.

Green & Harrison are working on a porphyry dike claim at Deadwood, near Yreka, and obtaining considerable coarse gold.

TRINITY COUNTY.

W. Sublett and T. F. Edmons located the Texas Jack quartz mine on Indian creek, near the dividing line between Shasta and Trinity counties, about two years ago. They bought an old 3-stamp mill, removed it to the Texas Jack mine and have taken out $30,000 with it.

Owing to the heavy rains of February, the Brown Bear mine, at Deadwood, has closed down until the weather settles. Supt. Dobler considered the continued working of the mine with the excessive rainfall unsafe, and, to avoid the chance of accident, closed the mine temporarily.

TUOLUMNE COUNTY.

The Mt. Jefferson mine, at Groveland, is said to show a large vein of fair-grade ore, through which the shaft is being sunk.

A double-compartment shaft is being sunk on the Eberhardt mine, at Campo Seco, by the company which a short time ago bought the property.

It is reported that a rich strike has been made in the Chapparal mine, in the Buchanan district, the property of F. Wenzel of Sonora.

COLORADO.

BOULDER COUNTY.

The Nancy tunnel, being driven from near the new chlorination mill at Wall Street, is 1263 feet in. The tunnel plant comprises power drills and machinery for considerable additional length. Besides cutting the Lucky Star vein the tunnel will cut a number of other properties below the bottom of their workings through shafts.

CHAFFEE COUNTY.

It is reported that the Chance mine, at Whitehorn, has been sold to C. L. Arzeno, J. McConoghy and C. F. Rickey of Cripple Creek. It is the intention of the new owners to repair the buildings and equip the mine with a plant of hoisting machinery.

Manager R Taggert of the Tasmania Copper M. & M. Co., at Winfield, has been prospecting the Last Dollar vein and has opened several new bodies of high-grade ore. In addition to the high-grade sulphuret zone, there are from 8 to 12 feet of quartz on the hanging wall, carrying from 5% to 7% copper, with some values in gold, silver and lead. To handle this low-grade ore a tramway is to be built 3000 feet in length, which will dump the ore into the smelter bins.

CLEAR CREEK COUNTY.

(Special Correspondence).—The operations of the American Gold Standard mill are of interest, as they constitute the first trial in this county of concentration and cyanide work combined. The work comprises wet crushing, table concentration and pneumatic cyanide method of leaching. Cyanide solution is used in crushing and table work, the tailings passing to the leaching vats. The ores are an iron and lead sulphide, with a small per cent of copper, and pretty siliceous. The heavy sulphide product is saved by the tables, the siliceous and oxidized material in the slimes yielding to the cyanide work. Manager L. G. Linn, it is claimed, saves by this method 93% of the gold and 73% of the silver. Three Wallace mills are in use as pulverizers.

Idaho Springs, Feb. 27.

The property of the Consolidated Alpine G. & S. M. Co. at Idaho Springs has been sold to Evansville, Ind., people, who will immediately develop the property. They have incorporated with O. F. Jacoby of Evansville, Ind., president, and W. H. Gilbert of Evansville, Ind., secretary. T. B. Crow of Idaho Springs is manager. The company will erect a new shaft house and install a hoisting plant. The shaft will be sunk an additional 600 feet, which will give a total depth of 900 feet.

Prof. Carpenter of the Golden smelter has shut down and will more than double the capacity of the plant for the ores from the Saratoga mine, which will be taken out through the Newhouse tunnel. By the time the additions are completed it is expected that the vein will have been cut. The company is now putting in the new air compressor at the mine for the purpose of drifting out near the line of the tunnel and then sinking a winze from the present 1000-foot level of the Saratoga. Then all of the ores will be dropped through it to the Newhouse tunnel, which opens the vein at a depth of 2200 feet from the surface. Present plans are for the handling of about 800 tons of the crude ore per day.

W. H. Ross, of Grand Junction, manager of the company operating the Mint property at Georgetown, says that 130 feet have been driven since January 15th, an average of over 3 feet per day. A dynamo has been bought to furnish power for the electric drills. An oil engine is to be installed.

The shaft on the Banty in Spring gulch, Idaho Springs, is down 250 feet and will be continued to the 300-foot level. A 60 H. P. air compressor will be installed early in the spring.

It is reported that R. C. Vidler of Idaho Springs will push his Horseshoe tunnel through the range under Argentine pass. As soon as Mr. Vidler can complete arrangements, a plant of machinery will be installed on the tunnel, which, as pro-

jected, will be from 7000 to 10,000 feet long.

The Republic Con. Co. has cleaned out and retimbered the 300-foot crosscut on the Ruby property, near Empire station. Square timbers are used throughout. F. H. Collins, president of the company, is acting as Supt.

EAGLE COUNTY.

The Emma M. Co. of Denver, operating in Eagle county, has elected S. P. Sloss president and E. B. Kelly secretary. The company has let a contract to sink 50 more feet on the claim.

GILPIN COUNTY.

At the Barnes mine, Central City, the shaft is down 580 feet deep. Drifting and stoping is being carried on in the 400 and 500-foot levels. A good production is being made both of concentrating and smelting ores. The mine is owned by Milwaukee people, and operated as the Horseshoe G. M. Co., with N. H. Scheuer as Supt.

The Bertha M. & M. Co. has bought the Carcassone mine in Elkhorn gulch, near Russell. The company proposes to install a new plant of machinery and to continue sinking the shaft, which is now down over 200 feet.

The Kokomo mine, in Willis gulch, is operated by Boston people, with W. H. Adams as manager, and considerable concentrating ore is taken out and treated at the mill owned by the company at Dumont, in Clear Creek county. The ores show a good percentage of lead. In a winze below the 300-foot level some fine looking copper ore has been opened up.

GUNNISON COUNTY.

Mr. Genson, the manager of the Forest Hill M. & M. Co. of Taylor park, says a site has been selected 2 miles from the mine at the nearest point at which a water supply for milling could be obtained. A tramway will be constructed early next season from the mine to the mill, and transportation of ore will be made for, approximatley, 15 cents a ton. Late tests from dump ores from the Tourist shaft having an average value for the crude ore of $9 per ton, resulted as follows: Four grades of concentrates were secured. First a clean lead product, comprising .83 ounce gold, 27 ounces silver, 80% lead and 1% silica and zinc; second, a lead and iron product, carrying .65 ounce gold, 31 ounces silver, 31% lead, 2% silica and 8% zinc; third, an iron product, carrying .14 ounce gold, 31.4 ounces silver, 14½% lead, 20% silica and 6% zinc; fourth, a zinc product, carrying .08 ounce gold, 13 ounces silver, 4% lead, 5% silica and 37% zinc. The developments made indicate the present mill to be inadequate in capacity for the ore blocked out and on the dump, and plans are under consideration for its enlargement next season.

HINSDALE COUNTY.

Development work on the Lillie mine, at Lake City, under G. Staples, Supt., is progressing. The pipe line for the power plant has been taken up to the ground.

LAKE COUNTY.

The Cord M. Co. has been incorporated at Leadville by W. H. James, W. W. Davis and C. N. Priddy, with capital $125,000. The company is formed to consolidate a portion of the ground along the line of the Yak tunnel with the Silver Cord property.

LARIMER COUNTY.

In the Wolverine mine, situated near the State boundary line between Pearl, Colo., and Grand Encampment, Wyo., besides a lead of copper ore there has been opened a mineral formation nearly 200 feet wide, carrying zinc, tin and nickel in considerable quantities, together with gold, silver, lead, antimony and bismuth.

OURAY COUNTY.

A group of Red Mountain properties—the Forest Queen, Last Chance, Great Western, Sundown and other claims—near Ouray, have been sold to A. E. Cox of Huntington, W. Va. A 1000-foot tunnel will constitute the initial development.

——Another company is to buy the Maud S. and J. I. C. properties. These latter carry a smelting ore. It is expected that the Saratoga pyritic smelter will be built in the north end of Ironton.

It is said that an English company has secured control of a group of claims in Ice Lake basin, near Ophir, and will start up on June 1st on an extensive scale. J. L. Russell of Denver is interested in the enterprise with the English company which is represented by J. M. Gallow. The development contemplated is a 200-foot shaft for the Grand View and a 600-foot crosscut tunnel to cut the Last Hope vein. The milling plant will be newly equipped.

PITKIN COUNTY.

President P. Hagerman of the Mollie Gibson mine at Aspen, in his annual report says: "During the year the mine produced a practically continuous supply of ore for the mill, the total amount of concentrates and smelting ore shipped having been 4607 tons, as compared with 4802 tons the previous year. The gross value per ton of ore milled decreased from $8 03 to $7.62. There was a large and unavoidable increase in cost of mining, pumping and renewals and additions to plant, and also a considerable increase in freight and treatment charges. The increase in expenses, amounting to about $35,000, was caused principally by the large amount of development work done and the increased cost of handling water from the thirteenth level." The report of the treasurer shows that the company has cash on hand amounting to $54,599.45. The gross receipts from ore sales during the year amounted to $206,560.52, but the mining, shipping and mill expenses reduced the net profit at the mine to $13,-274.18; and after other expenses, such as legal and general expenses, taxes and salaries amounting to $5100 had been taken out the profit for the year's operations came to $5246.28.

PUEBLO COUNTY.

J. Schulte, technical director of the Company of Metals and Chemical Products of Overfelt, Belgium, is in Pueblo to approve the plans prepared for the construction of the $1,000,000 zinc smelter to be erected by the United States Zinc Co. The new plant will occupy 500 acres and will have a capacity of 250 tons of ore, using 500 tons of coal per day and employing about 1000 men. The ores for treatment will be obtained from Leadville, Kokomo, Aspen, San Juan, Clear Creek and Gilpin counties. It will take ores carrying as low as 30% zinc.

SAGUACHE COUNTY.

The Saguache Home M. Co. has been incorporated at Saguache, capital $15,000, with T. Noland, J. Slane, H. Tarbell, E. Williams, W. A. McIntyre and G. H. Davis, all of Saguache, as directors, and office in Saguache. To this company have been transferred the Dixie, Gold Dollar and the Crystal lode mining claims, in Findley Gulch mining district, near Klondike.

The Blanca Mutual M. & M. Co.'s property, at Liberty, in the shaft at 200 feet depth shows an ore body 4 feet wide. It is free milling. A 5-stamp steam mill has been erected. C. C. Chapin is manager.

SAN JUAN COUNTY.

The Menomic M. & L. Co. has been incorporated in Denver, capital $50,000, by B. Bloom, R. M. Ballinger and W. C. Baker, all of Denver. The company has a bond on the Menomic gold mine, near Silverton.

The winter work on the Peacock group, near Silverton, with a small force of men, has made a good showing of gold quartz, which has been drifted on 250 feet in one of the tunnels. Associated with the gold ore is a streak of tungsten ore, some of which is high grade. About 200 feet from this ore shoot another tunnel has been driven on a vein of tungsten ore which would pay with concentration. The property is owned by W. H. Moore and A. Lamson of Durango, with Maryland people. Some time during the coming season it is the intention of the developing company to put up a mill.

The Natalie tunnel at Silverton is being driven at a rate of 43 feet a week and the heading is now 1350 feet from the portal. The Occidental vein for which the tunnel is being run is believed to be within the next 100 feet. With the facilities of improved machinery and drills the company is doing its own tunnel work at about two-thirds the cost of contracting it.

SUMMIT COUNTY.

The Puzzle M. & R. Co. have purchased the Engel mill at Breckenridge and will put in new sets of Colorado Iron Works' rolls and Wilfley tables.

At the meeting of the French Gulch G. M. Co., at Breckenridge, P. J. Nevins was re-elected manager. The mine is to be started up about the middle of March.

TELLER COUNTY.

For the month of February the total production of ore from the Cripple Creek district amounts to 50,825 tons, which under treatment yielded the sum of $1,865,-437.50 gold. The figures given out by the smelters and the various mills buying this ore are as follows:

	Tons.	Per Ton.	Value.
Smelters	14,000	$60	$840,000
Colo. Standard	24,000	30	720,000
Union	9,500	23	218,500
Dorcas	2,625	25	66,937
R. M. Smelter	600	30	18,000
American Z. L. Co.	100	20	2,000
Total	50,825		$1,865,437

The Gold Dollar Con. Co. is planning a new plant of machinery for the main shaft on the mine at Cripple Creek. The plant is to be a cage equipment good for a depth of 1500 feet. The equipment at present is good for 150 or 200 feet of additional sinking. The output of the company and lessees is running at twenty tons of $30 ore per day.

The Portland Co., at Victor, is reported to have opened another large ore body. The ore is said to average three ounces gold to the ton. The find was made in the 500-foot level, north of the shaft, in what was supposed to be the wall of the vein.

IDAHO.

CUSTER COUNTY.

H. J. Luce, president, and H. K. Matthews, vice-president of the White Knob C. Co., near Mackay, have been examining that property and report 200 men at work, and a sufficient amount of ore blocked out to run the smelter for several years. The copper smelter now nearing completion will have a capacity of 600 tons a day.

IDAHO COUNTY.

The Alder Creek G. M. Co. of Lewiston has elected D. T. Denton of Duluth, Minn., president, and J. H. Grannis of Duluth secretary. The company owns 640 acres of placer ground north of Pierce City, on which men have been at work during the winter. It is expected to have the ditch dug and a giant at work by the first of April.

The Zena G. M. & M. Co., capital $1,500,-000, has been incorporated in Spokane, Wash., to operate two claims said to be near to the Dewey mine at Thunder mountain. H. C. Brown is president and F. L. Sutemelster, Jr., secretary.

The Thunder Mountain Star M. Co., capital $100,000, has been incorporated in Spokane to operate at Thunder mountain. J. S. Payne, E. W. Taylor, M. M. Arant, J. S. McCall and A. L. McDonald are the trustees.

OWYHEE COUNTY.

Sinking has been started from the 1400-foot level of the Black Jack mine at Silver City to make a connection with the Florida tunnel which is being driven from Dewey. The shaft or winze will be about 300 feet deep, 4x12 feet in size, and of three compartments. The sinking station is practically completed, and is about 40 feet in height, 36 feet long, and varies from 20 feet wide at the tunnel level to 5 feet at the sheave wheel. A holst, operated by compressed air, has been installed in the station. The tunnel is now considerably over a mile in length.

SHOSHONE COUNTY.

C. E. Burns is in charge of the work on the Leslie mine, near Wallace, during the absence of Manager Everett, and has started a 700-foot tunnel to reach the north ledge under the shaft, in which rich copper ore was found.

The St. Paul-Idaho M. Co., operating the Douglas group on Pine creek, near Wallace, under bond, has drifted 470 feet on the ledge, in ore all the way, some of it shipping grade.

The Gold Standard M. Co., which is opening up some deep placer ground on Pony gulch, between Wallace and Delta, has secured some additional placer claims from F. C. Gordon. D. Love of Murray is in charge of the work and a drain ditch is being run.

MONTANA.

BEAVERHEAD COUNTY.

J. E. Morse and A. J. Noyes of the Ajax mine in the Big Hole basin, near Dillon, say that the lead in the mine where work is now being done is 25 feet wide. A small quartz mill will be put on the property in the spring. The ore carries gold, silver and lead.

The Hecla Con. M. Co., operating at Glendale, in its twenty-first annual report of its manager, H. Klippenberg, covering operations during 1901, shows: Receipts from sources, $139,561.94; all expenditures (except dividends), $107,804.37. Net cash profit, $31,757.57. Two dividends, Nos. 149 and 150, were paid, aggregating $30,-000, and the surplus on Dec. 31, 1901, was $40,834.74. The total dividends paid, including the last two, amounts to $2,250,-000. The metal production during 1901 was:

	Silver. Ozs.	Gold. Ozs.
From ore	218,773.18	193.284
From furnace, barrings, etc	1,968.26	7.558
Total	220,741.44	200.842
	Lead. Lbs.	Copper. Lbs.
From ore	750,806	101,938
From furnace, barrings, etc	16,443	1,753
Total	767,249	103,691

The mine report of S. A. Barbour, Supt., gives the following statement of the expenses (labor, wood and mining timbers), and ore production of the company's mines at Hecla, for the year 1901, viz.:

Name of Mine.	Amount of Expenses.	Tons First-class Ore
Atlantis	$14,482.57	142
True Fissure	6,324.65	
Cleve and Avon	41,162.73	1790
Wood	2,557.35	
Mining Timbers	115 70	
Total	$64,643.00	1932
Trapper lease		12
Total tons ore produced		1944

The cost of mining the first-class ore, on the basis of the above table of expenses, was $33.46 per ton.

CASCADE COUNTY.

The Ripple mine at Neihart will be started up by the owners, P. M. Collins manager. The mine has been developed with tunnels, shafts and upraises at an expense of about $40,000, and since last November about $20,000 worth of high-grade ore has been shipped.

CHOTEAU COUNTY.

It is reported that E. W. King of Kendall has bonded the Alabama group and other claims near Landusky. They are cyanide propositions and belong to Putnam, Zortman & Reser. Some development has been done upon the Alabama claim and it is probable that if the bond is taken up a mill will be put on the property, as the ore is of too low grade to ship.

FERGUS COUNTY.

The Good Night and the Belvia, two cyanide claims in the Cone Butte district, near Lewiston, are being developed by J. W. Beam and F. Fuller, the owners. Samples taken at random from them run from $1.20 to $3.20 per ton in gold.

Four claims adjoining the J. T. at North Moccasin are being developed by Weaver & Goddell.

FLATHEAD COUNTY.

The equipment for a hydraulic placer plant is being hauled from Libby to the head of Libby creek by J. T. Vaughn and H. F. Greenwell, who will operate their placer mines during the coming season. Machinery is also being transported to the same district by the Howard P. M. Co., under Supt. F. Whitesides.

J. Brannagan, manager of the Fisher Creek M. Co. in the West Fisher district, near Libby, says that a snowslide completely destroyed the 10-stamp mill of the Blacktail M. Co. near his property. Sanford & Grubb of Kalispell are the principal owners.

GRANITE COUNTY.

The machinery of the 500 H. P. motor of the big 250-drill air compressor at the Bi-Metallic mine at Granite is being installed. One portion of the motor alone weighed fourteen tons and it required thirty-two horses to transport it from the railroad to the mine. The compressor will be the largest in the State. Power will be transmitted from the motor to the compressor by means of a rope drive, the pulleys for which contain nineteen grooves for the rope.

LEWIS AND CLARKE COUNTY.

Shipments of a carload of copper ore a day are being made from the Punches mine in Greenhorn gulch, near Helena. The shaft is down 270 feet on the incline and a crosscut is said to show from 12 to 20 feet width of solid ore. A big cave in the mine, surrounded on all sides by solid ore, has been discovered. The vein is on a contact between lime and granite. Punches started the mine up to supply the smelter with iron flux, and operated it a long time before striking the copper.

Work has been started by six men preparing for development on the Combination M. & Imp. Co.'s property at Greenhorn, near Helena.

MADISON COUNTY.

The sale of the Galena mine at Sterling by P. V. Jackson is reported to have been made by Butte people. Mikesell & Co. have been working the property under lease for several years.

The Butte & Potosi M. Co. has had eight men at work on its four claims near Pony and has driven a tunnel in 110 feet to the ledge. Nine feet of steel galena has been struck, carrying 60% lead, $48 in gold and twelve ounces silver. A drift has been run 300 feet along the ledge. The company, it is reported, propose to erect a 100-ton concentrator in the spring.

It is reported that in the Lester group of mines in Hulbert canyon, owned by J. Armors and R. Jeffries of Virginia, the main tunnel is in 570 feet and about 350 feet deep, showing the lead to be 26 feet wide. An average sample shows the gold content to be $8 per ton, and it is claimed to be good cyaniding ore.

MISSOULA COUNTY.

D. Lewis of Clinton states that an Eastern company, who are represented by J. A. Porter, have bonded two claims in the

Wallace district owned by A. B. Northey and C. Russell.

PARK COUNTY.

The annual meeting of the St. Julian M. Co., held at Livingston, elected W. A. Bercry of Detroit, Mich., president, and P. J. Nolan secretary and treasurer. The lead has been encountered in the mine and considerable ore developed, which runs about $50 to the ton. It is stated that the mill will be increased to 100 tons daily.

SILVER BOW COUNTY.

The Howard mine, C. A. Sheldon lessee, on Grizzly gulch, near Butte, is shipping two carloads of ore a month. The ore shoot is a pipe, sometimes narrowing to almost nothing and at others widening out into a good-sized chamber of gold ore which averages from $20 to $30 a ton,

NEVADA.

HUMBOLDT COUNTY.

The Sheba M. Co., with G. W. Bartch of Salt Lake, Utah, president, is making extensive preparations for the operation of their properties in the Star Canyon district, including the Mammoth group of eleven claims, as well as the Sheba group.

In the Silver King claim at Tuscarora, belonging to the Nevada Queen Co., after standing idle for about ten years, in December last work was begun on a small scale on the lode where it had been exposed in grading for the site of the Union mill, since removed. P. C. Hyman, Supt., has started sinking a shaft at this point and has found some very rich ore and is following it down.

LYON COUNTY.

Buckley, Davis & Daniels have struck a 15-inch ledge of high-grade ore in the Pat Kelley mine, about 3 miles north of Camhridge.

Farrell & Frost at Cambridge have the shaft on their mine down 350 feet, and at that depth are drifting on the ledge, taking out two tons of ore a day which goes about $20 per ton. The pay streak is about 3½ feet wide.

Davidson & Lockwood, who are operating on a claim near Camhridge, have let a contract to run another 100 feet of tunnel on the ledge. The ledge is about 1½ feet wide and is believed to be a good cyaniding proposition. Extensive development work will he done on this claim this summer.

NYE COUNTY.

The Tonopah M. Co. have a large number of men employed in sinking new shafts and erecting hoisting works, etc. Sinking is being done in the Brougher shaft on the Mizpah lode. It is now down about 250 feet, with the ledge in the hottom nearly 6 feet wide of ore that will mill $200 per ton. This shaft is being sunk to prospect depth, while the new three-compartment shaft is being sunk.

WASHOE COUNTY.

The Sparks M. Co, at Wedekind, is preparing to cut a station at a depth of 225 feet in the new shaft on the Reno Star mine. The roaster has been installed. The hrickwork of the new mill is nearly completed and the timbers have heen framed for the main structure.

A. Dondero reports an $1800 clean-up, the result of a short run on ore from the Cahin No. 2 mine, at Olinghouse.

WHITE PINE COUNTY.

Gray & Bartley are still developing their Ruth mine, at Ely, and state the quality of the ore continues to improve, the shaft now boing in solid copper sulphides.

In the Saxton mine of the McKinley group at Ely the shaft is now down 225 feet and drifts are being run on hoth levels. Manager McGill reports that the ore from the mine assays $97 in gold.

NEW MEXICO.

GRANT COUNTY.

The Allessandro Copper M. Co. has let a contract to J. H. Bates to sink an additional 75 feet on the Gettysburg mine at Burros. The character of the ore is mostly a low-grade copper carbonate and oxide from the surface to nearly 100 feet in depth. Below the 100-foot depth the ore is copper sulphide assaying from 6% to 15% copper. The company may erect a leaching plant to treat the low-grade ore.

SIERRA COUNTY.

J. Kasser has commenced sinking a well in Cold Springs gulch, near Hillsboro, with a view of erecting a stamp mill if he finds sufficient water.

The Las Animas Gold-Copper M. Co., operating the Wicks mine at Hillsboro, is continuing development work and adding to the large ore reserves. A 3½-foot wide ore body averaging $76 per ton in gold has heen struck in the 300-foot level.

P. J. Savage of Socorro has sold to the Abbey M. Co. two claims in the Pittsburg mining district, in the Caballo mountains, for $8000. The vein on the claims for their entire length is 70 feet wide between walls of lime and granite, and assays show 17% copper. The company proposes to at once put men to work to open up the mine. The company is also operating at Abbey, in Socorro county, under the management of N. Hall. In the mine at this place a large flow of water has been struck. Estimates are being made for a pumping plant that will enable the company to sink its main shaft to a depth of 700 or 800 feet.

A. G. Brower of Utica, N. Y., has completed arrangements with his partner, J. W. Orchard, at Hillsboro, to go ahead with the development of the Dude and Macho mine.

Colorado people have taken an option of D. S. Miller's claim and the property of W. Keil and J. Johe at Lake valley. It is their intention to buy hoisting machinery and to sink a 400-foot shaft.

SANTA FE COUNTY.

The Consolidated M. & M. Co.'s smelter of 100 tons daily capacity, at Cerillos, has been blown in and is treating eighty tons daily. The bulk of the ore is coming from Magdalena, where the company's mines are producing ores carrying silver, lead and zinc values. The company also contemptates the erection of a 100-ton concentrator, to cost $70,000, and 10 miles of railroad, which will afford transportation facilities for their own and other ores produced in the Cerillos district. It also contemplates building 18 miles of road into the San Pedro district and the Pecos fields, 13 miles distant.

VALENCIA COUNTY.

The Belen-Carricito Dev. Co. of Belen has elected P. B. Dalies president and C. A. Dalies secretary and treasurer. The company is working several claims in the Carricito district in the Manzano mountains.

OREGON.

GRANT COUNTY.

It is reported that the Badger mine at Susanville has heen honded at $500,000 by F. W. Bradley of San Francisco. Work has heen done on the Badger all winter, and several rich bodies of ore have been uncovered. An air compressor and power drills have been put in, and a $100,000 reduction plant is under consideration. The new town of Susanville is located at the Badger mine on Elk creek. The name of the old town of Susanville, which is quite a distance from the mine, has heen changed to Galena. A new postoffice has been established at Galena.

JACKSON COUNTY.

The Gold Hill M., Power & Dev. Co. has been incorporated to operate and develop mines in Jackson county and to operate electric light and power plants at Gold Hill. J. J. Houck, T. J. Kenney, J. Nunan and E. A. Reames are the incorporators.

It is reported that E. K. Anderson has bonded the Golden Fleece mining property, near Ashland, consisting of 200 acres, at $20,000, to W. C. Latham, president and Supt. of the Pacific M. & M. Co.

JOSEPHINE COUNTY.

The Andrews Placer, property of W. H. Andrews at Dry Diggings, has been hought by M. C. Ament for the Golden Drift M. Co. The property has heen incorporated with the greater Dry Diggings property, on which a hig pumping plant is to he installed to provide water for hydraulicking.

The Golden Drift M. Co. has heen incorporated, capital $1,500,000, to operate a hydraulic mine at Bloody Run, 3 miles south of Grants Pass. The plan provides for 1200 inches of water for the six giants, the water being pumped direct to the giants. M. C. Ament, manager of the Dry Diggings placer mines, is the manager.

SOUTH DAKOTA.

LAWRENCE COUNTY.

In the Bear Gulch district, near Deadwood, a California company has honded several hundred acres of placer ground until Sept. 1, 1902, from J. Treber of Deadwood, E. Grosfield of Spearfish. E. St. John, M. Heidloff and a number of others of Bear gulch. The people taking the bond undertake to develop the claims.

The National Smelting Co. is considering the converting of the old chlorination works at Rapid City into a custom cyanide plant, to be run in connection with the smelter.

PENNINGTON COUNTY.

The Lulu M. Co. has heen formed to operate the Lulu mine, owned by J. McClure and located near Hill City. J. R Wilson and M. R. Day of Deadwood, and J. McClure of Hill City are the incorporators. The capital is $500,000. Mr. Day is manager. The development work on the ground has opened up a vein of free milling ore.

It is reported that the Belt Dev. Co., which has been sinking a shaft and exploring the Homestake veins at Kirk, has decided to huild a 200-ton dally capacity quartz mill about 3 miles up Rapid creek from Silver City.

UTAH.

The Utah mines paid in dividends to their shareholders during the month of February the sum of $314,000, as follows: Silver King, $100,000; Quincy, $125,000; Daly-West, $60,000; Yankee Con., $25,000; May Day, $4000.

BEAVER COUNTY.

F. C. Morehouse, Supt., of Tintic, and L. G. Brown of Salt Lake, have bought the Lady Curzon group of seven claims near Milford from J. Forgie. A shaft is to be sunk on the vein at a point near the adjoining Copper King ground.

The Golden Reef M. Co. of Richfield, operating a mine located near Frisco, has decided to put in a hoist during the immediate future.

E. Mingle, manager of the Monte Cristo Co. of Salt Lake, has started work on the company's mines in Star district, near Milford. The property consists of the John Kempel and Good Luck claims. It is a silver-lead vein, with pockets of high-grade gold ore. The ore is free-milling. It is the intention to run the tunnel 125 feet for the purpose of prospecting the vein and then sink a shaft.

BOX ELDER COUNTY.

The Prince of India M. Co. of Salt Lake City, operating north of Ogden, has let a contract for 200 feet farther extension of its tunnel. The mine is a copper and gold proposition, owned hy Waltman Bros. and D. Maguire, who have associated with Eastern capital. The tunnel is now in 365 feet.

SALT LAKE COUNTY.

J. F. Leland, manager of the Moscow, Saginaw and Amelia claims at Bingham, owned principally by Columhus, O., people, has had a crew of men st work all winter. A hoarding - house has been erected and ore bins have been constructed, and tunnel work to the extent of 800 feet has been completed, giving the present workings a depth of between 400 and 500 feet. The ore bins now contain, Mr. Leland states, over 300 tons of ore, carrying silver, lead and gold of an average of about $25 to the ton.

SUMMIT COUNTY.

The Daly-West M. Co. has brought suit in the United States courts at Salt Lake City against the Quincy M. Co. The suit is brought for the purpose of restraining the defendant company from extracting ores from the ground within the vertical houndaries of the Daly - West Co.'s property at Park City, and further to confirm in its ownership and title the claim of the plaintiff company to all the ore bodies on the ground in dispute. Property valued at over $1,000,000 is involved in the suit.

TOOELE COUNTY.

The Mono group of twenty-three claims, located at the head of Dry canyon, near Ophir, has been worked during the winter. In a drift off the old tunnel, 2300 feet from the tunnel's mouth and 1300 feet below the surface, a rich ore shoot has heen struck. Samples assayed have given as high as 22.7% copper, 45.45% lead, 142 ounces silver and $3 40 in gold. The Mono M. & M. Co. is preparing to erect a mill on this property.

WASHINGTON.

The report of State Inspector of Coal Mines C. F. Owens for the year 1901 shows that the amount of coal mined during the year was 2,504,190 short tons, an increase of 86,156 tons over tho output of 1900. The amount of coke produced was 49,197 tons, an increase of 13,275 tons. He states that but for the use of oil for fuel to a considerahle extent in California the increase of the output over 1900 would undoubtedly have heen greater. The local demand for coke and coal, it is stated, is rapidly increasing. The total number of men employed in the mines is 4826.

COWLITZ COUNTY.

The Red Star M. Co. of Kalama has been incorporated, capital $750,000. R. E. Darnell is president and S. C. Cook secretary. The company will develop the Eli D. mine on the Kalama river.

FERRY COUNTY.

The Independence M. Co. has heen incorporated, capital $100,000, with E. D. Sanders, J. L. Prickett, A. G. Ansell, Van B. De Lashmutt, T. Olsen and W. M. Byers of Spokane trustees. The company will develop four claims located about 3 miles southwest of Nelson. A shaft is down 70 feet on the Independence claim, in ore which assays from $20 to $60 per ton in silver and copper. The vein is from 15 to 20 feet wide and will he developed from a shaft.

SPOKANE COUNTY.

The old Spokane City smelter has been sold to S. Grant, trustee for Detrolt people, for $8500, who will rehuild and operate it.

FOREIGN.

BRAZIL.

A new diamond field is reported to have been opened by a New York company, of which R. R. Fogel is president. The find is situated in North Brazil, 178 miles from the coast.

BRITISH COLUMBIA.

The lessees and owners of the Ottawa mine, at Slocan, have turned over tho mino to Pittsburg, Pa, people, associated with W. D. Wrighter of Spokane, Wash., who have bought it for about $45,000.

In the War Eagle's fifth annual report for 1901 Manager Kirby says: "From the seventh to the eleventh levels a new dopth of 700 feet on the vein is now accessible, and its exploration by levels is fairly under way. The main shoot down to the sixth level, a depth of 754 feet, has contained about 165,000 tons, with a smelter's gross assay value of $3,100,000 From the nature of the ground it is impossible to see ahead or to make any predictions as to the chances of success or failure."

J. P. Graves, general manager of the Granby Con. M, S. & P. Co., says that the third furnace in the smelter of the company at Grand Forks has been blown in, and that 1100 tons of ore per day is being roduced. In about two weeks the fourth furnace should be in operation and then the daily quantity reduced will he 1500 tons. The converter is now treating matte from the Greenwood, Grand Forks, Nelson and Van Anda smeltors.

Shipments of ore from the Boundary mines for the week ending March 1 were: Granby Mines 5774 tons, Mother Lode 3338 tons, Snow Shoe 300 tons, Winnipeg 35 tons, Golden Crown 30 tons, total 9467 tons. The Greenwood smelter treated 1455 tons of ore and the Granby smelter 4753 tons, total 6208 tons for the woek.

The Canadian King Con. G. M. Co. has made its first shipment of twenty-three tons and the net smelter returns amounted to $641. The company's property is at Erie. The control has been bought by Cripple Creek, Colo., people, including J. M. Allen and associatos.

E. Baillie of the Idaho-Centennial mine, near Port Hill, states that twelve tons of ore are heing shipped a day. W. Roberts, Supt., has gone to Duluth, Minn., to confer with Eastern shareholders as to additions proposed to the plant.

The Sunset mine at Cody has paid dividend No. 5, amounting to $6000, making total dividonds to date $30,000. It is operated hy its owners, G. W. Hughes of Alamo, J Daly of Kaslo, F. J. Finucane of Greenwood and Mr. Cockshutt of Brandon, Man. G. W. Hughes is manager.

FORMOSA.

The Fujita-gumi Co. of Osaka, Japan, will construct a gold smelting station and refinery at the sea shore of Koshiryo, Formosa, at an estimated cost of 200,000 yen. This construction will be finished in six months. This plant will be able so smelt 300,000 kamme of ore and to produce 12 kamme of gold a month. This enterprise was started as a result of Dr. Tsuno's experiments on the hlue clay ore which proved that gold could be extracted from it successfully.

MEXICO.

The mines and smelter of the Omaha Grant Smelting Co. at Volardena, Durango, have heen sold to the American S. & R. Co. for $5,000,000.

The Cubanas Con. C. Co is developing a property in the Monteserrat mountains, about 25 miles south from La Cananea, Sonora. H. J. Corcoran of Stockton, Cal., is president and A. H. Markley of San Francisco is secretary.

In the Sahuaripa district of Sonora, J. R. Hooper has sold for $25,000, to an American company, the San Miguol mine, near Arevechi. The company buying will proceed immediately to develop it and will install machinery.

YUKON TERRITORY.

Complete confirmation of the reports of rich pay dirt on Frazier or Mush creek, near Dalton's Post and other streams in the new gold district back of Porcupine, Alaska, has heen brought to Skagway by M. Brown, who says that Frazier creek is nearly 30 miles long and runs through a slate country. He prospected rimrock on three creeks with good results, and stakod claims on each of them. So far 130 claims have been staked, and Brown says there is room for 1000 more. The ground is shallow and free from boulders, and pay is evenly divided.

According to the Gold Commissioner's interpretation of the Treadgold concession to Klondike claims, Bonanza, El Dorado, Hunker, Bear and Last Chance creeks, together with all their tributaries, are closed entirely, and everything to which a grant was not issued prior to January 1, 1902, clear from summit to summit, is turned over to Treadgold and his associates. They, if they so chooso, need not

spend a dollar in the development of their gift for two years, during which time the public domain which has been presented to them lies idle, for they are prohibited from working any of their claims until certain conditions have been previously fulfilled. Within three years' time they are required to put 2000 inches of water on Bonanza creek and expend not less than $250.000.

News from Fort Selkirk, stated to be responsible, reports a placer discovery being made on an unnamed tributary of the White river, over the divide, on the Dalton trail, between Selkirk and the Nordenskiold river, more than 100 miles from Dawson. It is said that the find consists of coarse gold that runs $25 to the pan. A thousand men are reported to have left Dawson by all manner of conveyances—bicycles, dogs, horses and on foot—for the locality of the strike.

Personal.

N. HALL is manager Abbey M. Co., at Abbey, N. M.

GEO. STARR, Supt. Empire mine, Grass Valley, is in San Francisco.

C. K. COLVIN of Denver, Colo., is sojourning in Los Angeles, Cal.

W. EVERETT, manager Leslie mine, at Wallace, Idaho, is in New York.

W. H. MERCER is Supt. Mercer Tunnel Co, operating near Clifton, Ariz.

M. R. DAY of Deadwood, S. D, is manager Lulu M. Co., at Hill City, S. D

JOHN DUNN, late of Cripple Creek, Colo., has located at Nogales, Ariz.

D. A. MCDONALD has returned to San Francisco from a visit to New York.

E. E. WANN has been appointed Supt. Champion mine, near Prescott, Ariz.

R. G. LEGG returns this week from Reno, Nev., to Salt Lake City, Utah.

T. B. COUNTRYMAN of Cripple Creek, Colo., is sojourning in Kingman, Ariz.

C. J. DAVIS is Supt. Lucania M. Co., which is operating at Placerville, Cal.

F. A. M. BURRELL of Chas. Schieren & Co, New York, is sojourning in California

H. M JARVIS, Supt. Bob Lewis No. 2 mine, Westville, Cal., is in San Francisco, Cal.

PERCY WILLIAMS, M. E., has returned from San Francisco to Salt Lake City, Utah.

P. E. HARROUN, C. E., late of Albuquerque, N. M., has removed to San Francisco, Cal.

T. E. SCHWARZ, M. E., Denver, Colo., accompanied by his wife, is visiting in California.

F. D. SMITH of the Chainman M. Co. at Ely, Nev., is in Mexico examining a mining proposition.

D. LOVE of Murray, Idaho, is Supt. Gold Standard M. Co, operating near Delta, Idaho.

W. SHARP, late Supt. Central quartz mine, at Damascus, Cal., is sojourning in Oroville, Cal.

T. ELLIOTT of Telluride, Colo., is at Tonopah, Nev., in the interest of some Colorado people.

J. M. BURKE of Boise, Idaho, was in San Andreas, Cal., last week, examining mines at that place.

E. H. MARTIN has been appointed metallurgical engineer of the Carnegie Steel Co., Pittsburg, Pa.

J. J. SAVELLS has been appointed foreman at the Capitol mine at Dale, San Bernardino county, Cal.

JULIAN SONNTAG of the Giant Powder Co. has returned to San Francisco from Novada county, Cal.

W. J. BELCHER, manager of the Fir Cap Con. M. Co. at Downieville, Cal., is in San Francisco, Cal.

A. KNUDZEN, manager Bob Lewis gravel mine, at Westville, Cal., is sojourning in Philadelphia, Pa.

WILLIAM T. ST. AUBURN, manager of the Niagara mine at French Gulch, Cal., is in San Francisco, Cal.

E. V. ORFORD, manager De Lamar mine, Silver City, Idaho, has returned there from San Francisco.

CHAS. F. FERRY, a California miner, now Supt. Candelaria, Mexico, mines, has returned to San Francisco.

CLARENCE K. COLVIN, M. E., has returned to Denver, Colo., from Sonora, Mexico, and points in Arizona.

E. O. KENNEDY is in charge of the smelter of the Calabasas Copper Co. in the Santa Ritas, near Nogales, Ariz.

J. A. FERGUSON, Supt. Red Point gravel mine, at Westville, Cal., was in San Francisco, Cal., early in the week.

J. B. HOBSON, Supt. Cariboo hydraulic mine, at Bullion, in the Cariboo district, B. C., is sojourning in Auburn, Cal.

D. P. ROHFING of Salt Lake City, Utah, has gone to Fay, Nev., to examine some gold-bearing properties for Eastern people.

W. ROBERTS, Supt. of the Idaho-Continental mine at Nolson, B. C., is in Duluth, Minn, the head office of the company.

J. R. ROBERTSON, M. E, of Philadelphia, Pa., is in Atlin, B. C., district examining quartz mines under development there.

H. Z. BROOK of Hancock, Mich., is manager Northwestern Dev. Syndicate, operating the Camborne group, near Nelson, B. C.

V. C. HEIKES of Salt Lake City, Utah, has been appointed chief clerk of the Department of Mines and Mining at the St. Louis World's Fair.

A STEWART, manager of the Silver King mine at Warren, Idaho, has returned there from a sojourn of some weeks in Eastern cities.

W. D. CURTIS, southern California representative of this journal, returned this week from San Francisco to his Los Angeles, Cal, headquarters.

T. L. WALL of Preston, S. D., and P. C. Waite of Bozeman, Mont, have been making an examination of a mining proposition near Philipsburg, Mont.

J. GORDON, formerly millman at the Empire mill at Plymouth, Cal., has accepted a similar position at one of the Hayward & Lane mines in Sonora, Mexico.

LEO VON ROSENBERG of New York returned on the 2d inst. from Mexico by steamship Curacao. Mr. Von Rosenberg examined mines in Sinaloa and Lower California.

G. MCLEAN has resigned as Supt. Detroit Copper Co. mines, in Morenci, Ariz., and M. H. McLean, his brother, the present assistant Supt., has been appointed his successor.

G. V. MITCHELL, assistant manager on the Cache Creek placer at Granite, Colo., for several years past, has resigned to accept a position with a mining company in South America.

J. D. YOUNG, mining engineer of Chicago, visited the galena, lead and zinc fields of Illinois, the past week. Mr. Young was there examining a lead mine for Chicago people.

H. TROMP, a mining engineer, is at Tonopah, Nev. He is sent out by the Government of the Dutch East Indies to study the mining methods in vogue in the great mines of the United States.

R. MCF. DOBLE of San Francisco, Cal., returned from Victoria, B. C., to San Francisco early in the week and left at once for Mexico, where he is to examine a large electric transmission proposition.

LAWRENCE TATUM, mining engineer of Chicago, representing Prof. J. D. Young of Chicago, will make a visit to New Mexico, where he will examine a gold quartz proposition for Chicago people.

W. A. KOUSNETZOFF, C. E. and M. E. of Vladivostock, Siberia, was in Oroville, Cal, last week. He is traveling at the instance of the Russian Government, which has sent him to California to visit gold mines and inspect the methods in use, and especially to study dredger mining.

Commercial Paragraphs.

THE Carstarphen Electric Co. has equipped a shop in Denver, Colo., to do electrical work.

THE S. H. Supply Co., Denver, Colo, have enlarged their quarters and increased their stock. The latter now includes electrical equipment.

A SULLIVAN MACHINERY CO. four-drill air compressor has been set up at the Denver, Colo, office of that company by Western Manager R. D. Hunter.

JEAN F. WEBB AND SON of the Pneumatic Cyanide Process Co., Denver, Colo., have sold a milling right to Judge Robert Doyle of Watseka, Ill., who will use the process in a mill to be erected in Mono county, California.

CARL BINDER, engineer and contractor at Chicago, Ill., has issued a fifty-page catalogue descriptive of Otto aerial wire rope tramways, which states that these tramways can be constructed with grades up to 1:1 with clear spars of 3000 feet and more, for hourly transport up to 150 tons. It is stated that more than 1300 lines have been built and are in present use. The catalogue is handsomely illustrated and contains much interesting matter.

THE American Engineering Works of 204 Dearborn St., Chicago, Ill., is organizing a new system of trade publication consisting of a series of 4x6¼ cards and booklets intended to cover all points of mine, mill and smelter supply. It is expected that the number of these cards will reach 2000, and arrangements will be made so that they can be kept for reference on a card catalogue system of convenience to purchasing agents of mining companies.

THE Denver Gas & Electric Co. have closed a contract with the Bullock Electric Mfg. Co. of Cincinnati, Ohio, for new machinery for their West Side, Denver, station, consisting of one 1500 kilowatt direct-connected three-phase alternator, one 600 kilowatt three-phase belted alternator and one 400 kilowatt belted direct-current power generator. These machines constitute the third order for large machinery placed with the Bullock Co. by the Denver Gas & Electric Co. within the past eight months. Last September the Bullock people sold the same company a 600 kilowatt three-phase alternator, and immediately after its installation its duplicate was purchased. This last order will complete one of the largest plants in the West. This business was transacted through the Bullock Electric Mfg. Co. office at 251 Coronado Bldg., Denver, Colo.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING FEBRUARY 25, 1902.

694,231 —SASH FASTENER—W. W. Batties, San Jose, Cal.
693,943.—FLYING MACHINE—W. J. Bell, Los Angeles, Cal.
693,944.—RAILWAY SWITCH—W. J. Bell, Los Angeles, Cal.
694,242.—WAVE MOTOR—W. Borchart, Carson City, Nev
693,827.—TRACE BUCKLE—S. Boyer, Colfax, Wash
694,247.—TREE SUPPORT—T P Brown, Riverside, Cal.
694,002 —MINING ELEVATOR—H. W. Davis, Auburn, Cal
694,005 —CONCENTRATOR—W. G. Dodd, S. F.
694,060 —CUTTER HEAD—C. E. Hawley, Berkeley, Cal.
694,274 —PROPELLER—B. T Heroid, Vallejo, Cal.
694,290.—AMALGAMATOR—M. Lasswe l, Spokane, Wash.
694,311.—PUSH BUTTON—Laughlin & Schuyler, Los Angeles, Cal.
694,063.—PIN FASTENER FOR SHOW CARDS—L. Lemos, S. F.
694,064.—SUSPENDER CLAMP—L Lemos, S. F.
694,103.—MANIFOLD BOOK—A Levison, S. F
694,212.—PRESERVING WOOD—I. B. Sprague, Everett, Wash.
693,988 —CAR TROLLEY—E. W. Taylor, Spokane, Wash.
694,219.—MAIL BOX—W. L. Vestal, San Bernardino, Cal.
694,042.—BREAD TOASTER—R. C. Vroom, San Diego, Cal.
693,938.—OIL BURNER—G. E. Witt, Fresno, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CIGAR WRAPPING MACHINE.—No. 693 669. Feb. 18, 1992 J. J. Ryan, San Jose, Cal. This invention consists of a table or support having a central opening, bunch-supporting rollers in said opening, a slotted and slidable gauge plate above said rollers and in the plane of the surface of the table, said gauge adjustable for cigars of different lengths, a pivoted arm carrying a spring-pressed guide roller and movable in relation to the bunch-supporting rollers, so as to rest upon the bunch and hold it in position, a tip former carried by said arm and adjustable in relation to said gauge plate to the different lengths of cigars, a revolubic tucker, and means for operating the tucker and rollers in unison. This device can be operated with ease and rapidity, affording uniformity in results, and is adjustable for cigars of any desired form or length.

EXTENSION FOR CUTTER HEADS.—No. 694,060. Feb. 25, 1902. C. E. Hawley, Berkeley, Cal. This device relates to improvements in attachments for planing, grooving, matching and similarly actuated machines. It consists in the combination with a cutter-head of detachable blocks extending radially from said head so that a line substantially through the center of the blocks will intersect the axis of the head. Means are carried upon the blocks whereby the knife may be rigidly held and made to present its cutting edge in proper relation to the work. Plates or distance pieces are adapted to be interposed between the blocks and the head to increase the range of cut.

PIN FASTENER FOR SHOW CARDS.—No. 694,063. Feb. 25, 1902. L. Lemos, San Francisco, Cal. This invention is designed to attach show cards or price lists to goods and consists of a hook-shaped pin having a peculiarly constructed base and extended shank and a flexible fastener connected therewith. The pin has a transverse loop at its base and integral with it and a flattened extension at right angles with the loop with means for securing it rigidly to the card.

SUSPENDER AND GARMENT CLAMP.—No. 694 064. Feb. 25, 1902. L. Lemos, San Francisco Cal. This invention is designed to provide a device by which garments, such as trousers, may be supported from suspenders which pass over the shoulders of the wearer. It is the object of this invention to dispense with the use of buttons for making such connections. It consists of two parallel spaced plates pivotally united between their opposite ends; one of said plates having at one side a pivot connection, means for attaching the suspender, and a stop to limit the swinging movement of the other plate. Both of these plates have inwardly turned lower edges and portions between said edges and the pivotal connection corrugated in transverse lines, so that the edge of the goods may be firmly clamped between these corrugations and inturned ends by simply swinging the two plates so as to press the goods between them.

Latest Market Reports.

SAN FRANCISCO, March 6, 1902.

SILVER.—Per oz., Troy: London, 25 7/16d (standard ounce, 925 fine); New York, bar silver, 54¼c (1000 fine); San Francisco, 54¼c; Mexican dollars, 45¼c San Francisco, 43¼c New York.

COPPER.—New York: Lake, 1 to 3 casks, $12.50; carload lots, $12.12½; Electrolytic, 1 to 3 casks, $12 37½; carload lots, $12.00; Casting, 1 to 3 casks, $12 37½; carload lots, $12.00. San Francisco: $15 15. Mill copper plates, $18.15; bars, 24@18c. London: £55 17s 6d per ton.

LEAD.—New York, $4.12½; Salt Lake City, $3.60; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, $4.75. London, £11 13s 9d per ton = 2.43 cents per lb.

SPELTER. — New York, $4.10; St. Louis, $3.85; London, £17 per ton; San Francisco. ton lots, 5½c; 100-lb lots, 5¾c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

IRON.—Pittsburg, Bessemer pig, $17.00; gray forge, $15.75; San Francisco, bar, 2.60c per lh., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $30.00; open hearth billets, $31.75; San Francisco, bar, 7c to 12c per lb.

TIN. — New York, pig, $25.50; San Francisco, ton lots, 26c; 1000 lbs., 25½c; 500 lbs., 25¼c; 200 lbs., 25¼c; less, 26c; bar tin, per lb, 30c.

PLATINUM.—San Francisco, crude, $17 per oz.; New York, $18 per Troy oz

QUICKSILVER. — New York, $51.00 large lots; London, £8 17s 6d; San Francisco, local, $48.00 per flask of 76½ lbs.; Export, $45.00

MAGNESIUM.—New York, $2.90 per lb.; San Francisco, $3.75.

BISMUTH.—New York, per lb., Subnitrate, $1.50; San Francisco, $2.50 to $2.75 per lots.

ZINC.—San Francisco, 5½c; slab, 5¾c; bar, 7c; zinc dust, N. Y., 6c.

BABBITT METAL.— San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER. — Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 14.14½c.

NICKEL.—New York, 50@60c per lb.

FERRO-MANGANESE. — Pittsburg, 80%, domestic, $53.50, large lots.

TUNGSTEN.—New York, per lb., 95c; San Francisco, $1.15.

FERRO-TUNGSTEN. — New York, 37%, 32c; San Francisco, 65c (60%).

ASSAY LITHARGE.—San Francisco, 10c per lb, small lots.

PHOSPHORUS. — F. o. h. New York 50@60c per lb.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c per set; 14 oz., 40s., 9c.

OILS.—Linseed, pure, boiled, bbl., 76c; cs., 81c; raw, bbl., 74c; cs., 79c. Deodorized Stove Gasoline, bulk, 15c; do., cs., 21½c; 86° Gasoline, bulk, 21c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 14c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 90c; cs., 95c; No. 1 bbl., 65c; cs., 70c. Neatsfoot Oil, coopers' bbls., 70c; cs., 75c; No. 1 bbl., 50@52½c; cs., 55@57½c.

COAL. — San Francisco, coast, yard prices: Wellington, $9; Seattle, $6.50; Coos Bay, $5.50; Southfield, $9.00. Cargo lots, Eastern and foreign: Wallsend, $8.00; Brymho, $7.50; Pennsylvania, bd., $14.00; Scotch, $8; Cumberland, $12; Cannel, $9.50; Welsh Anthracite, $12.00; Rock Springs, $8.50; Colorado Anthracite, $14.00. Coke, $16 per ton in bulk; $18 in sacks.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 30@31c per lb.; carloads, 28@29c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66° B, 2c per lb.; soda ash, $1.90 per 100 lbs.; hyposulphite of soda, 2¾@3c per lb.; blue vitriol, 5¾@6¼c per lb.; horax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, $1.90@2.00; flour sulphur, French, 2½@2¾c; California refined, 1¾@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., $1.25 @1.50 per 100 lbs.; sks, $1.05; chloride of lime, spot, $2.50@2.60; nitrate of potash, in bbls, 8c; caustic potash, 10c in 40-lb. tins.

SITUATIONS WANTED.

MINING ENGINEER, with many years experience as manager and superintendent, is open for an engagement. Is at present engaged as superintendent of a large copper mine. Address Engineer, care Mining and Scientific Press.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED. — Position as superintendent of quartz mine. Worked as miner, engineer, mill man and superintendent. Superintendent at present. Would engage for foreign service. References given. Address Economy, this office.

WANTED.—POSITION AS MILL SUPERINtendent or Foreman. Understand concentration, amalgamation, cyaniding and assaying. Seventeen years' experience. Address "Mill Foreman," care of Mining and Scientific Press.

WANTED.—POSITION AS ASSAYER, SURveyor, or Assistant Superintendent by technical graduate; three years' experience in mines of California and Colorado. Address I. E. D., care of Mining and Scientific Press office.

WANTED.—Position as Assayer and Millman by a practical man. Am a practical miner. Understands cyanide work and mine accounting. Competent to act as assistant superintendent. Can handle men. No objection to Mexico or British Columbia. Address O. T., care of this office.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X Y. Z., this office.

WANTED—A Second-Hand Concentrator in first-class order, delivered to railroad. Give description and cash price.

Address N. S. TROWBRIDGE. Columbia Mill, Scott River Post Office, Siskiyou Co., Cal.

QUICKSILVER MINE in California, near railroad; fully equipped; new furnace; plenty cheap fuel for years; now paying handsome profits; one of the best mines in the State. A snap if you get it soon. Call on or write

MINING BUREAU & REAL ESTATE CO.
189-190 Crocker Building, San Francisco.

FOR SALE.

The rich mine Mejia, situated within the free zone in the State of Sonora, Mexico, 15 miles from Nogales and 10 miles from the station Agua Zarca of the Sonora Railway. Good wagon roads to the mine; abundance of water, timber and pasture. The mine produces abundance of silver ore of high grade, good for export; 25,000 tons of extracted ore on the surface ready for the mill.

The mine in question is situated in a north and south ridge at an elevation of about 300 feet from a creek that flows east. The surface that it occupies is 75 acres. The title of the land is clear. The vein is 36 feet wide, coursing North 2.° East and dips 50% toward the East.

The country rocks are porphyry and granite, the gangue being lime carrying silver minerals.

The mine has been worked to a depth of 160 feet. The greater part of the workings are crosscut tunnels. There is no water in the workings nor is timbering needed in the workings. The ventilation is good. The ore that has been exported has produced an average of 150 ounces of silver and is free and easy to work. The price of the mine will be named after the property has been seen by the interested parties.

The mine will be sold at a very moderate price and under favorable terms. For further information apply to MESSRS LUIS A. MARTINEZ, Guaymas, Sonora, Mexico; FILOMENO LOAIZA, Hermosillo, Sonora, Mexico; ROY & TITCOMB, Nogales, A. T., U. S. A.

ASSESSMENT NOTICES.

ROSS VALLEY LAND COMPANY.—Location of principal place of business, San Francisco, Cal.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 13th day of February, 1902 an assessment of seven dollars and fifty cents ($7 50) per share was levied upon the capital stock of the corporation, payable immediately to Charles P. Eells, the secretary of said corporation at room 211, in the Crocker building, at the corner of Post and Market streets, in the city and county of San Francisco, state of California.

Any stock upon which this assessment shall remain unpaid on the 20th day of March 1902 will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on the 5th day of April 1902, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHARLES P. EELLS,
Secretary Ross Valley Land Company.

Room 211, Crocker building, San Francisco, California.

GARIBALDI MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of February, 1902, an assessment (No. 2) of one and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 15 Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 7th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WILLIAM McPHERSON, Secretary.

Office—Room 15 Nevada Block, 309 Montgomery street, San Francisco, California.

SILVER KING MINING COMPANY.—LOCATION of principal place of business, San Francisco, California; location of works, Pioneer Mining District, Pinal County, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 31st day of January, 1902, an assessment (No. 23) of twenty-five (25) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Room 36, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 11th day of March, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 8th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 310 Pine street, Room 36, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 4th day of March, 1902, an assessment (No. 5) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 405, Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 29th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Office—405 Claus Spreckels Building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 25th day of February, 1902, an assessment (No. 34) of one-half (½) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of March, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—Room 31, 214 Pine street, San Francisco, California.

LITTLE STANDARD OIL COMPANY.—Location of principal place of business, San Francisco, California; location of works, McKittrick District, Kern County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 4th day of March, 1902, an assessment (No. 3) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 40, Chronicle Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of May, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.

Office—Room 40, Chronicle Building, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 19th day of February, 1902 an assessment (No. 6) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Rooms 58-59, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of March, 1902, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 14th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

JAMES B. BROOKS, Secretary.

Office—Rooms 58-59, 214 Pine street, San Francisco, California.

DELINQUENT SALE NOTICE.

CONSOLIDATED ST. GOTHARD GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 20) levied on the 1st day of February, 1902, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amt.
Block, Samuel	350	500	25 00
Bauer, Teress	518	200	10 00
Koch, C. A.	116	100	5 00
Koch, C. A.	138	11	55
Koch, August	139	11	55
Koch, August	329	100	5 00
Raabe, Geo. A.	354	200	10 00

And in accordance with law, and an order of the Board of Directors, made on the 1st day of February, 1902, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Rooms 113 and 114, Crocker Building, San Francisco, California, on MONDAY, the 24th day of March, 1902, at the hour of 2 o'clock P. M. of said day, to pay delinquent assessment thereon, together with cost of advertising and expense of sale.

B. N. SHOECRAFT, Secretary.

Office—Rooms 113 and 114, Crocker Building, San Francisco, California.

MINING AND SCIENTIFIC PRESS.

Whole No. 2173.—VOLUME LXXXIV. Number 11. SAN FRANCISCO, SATURDAY, MARCH 15, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Mine Unit.

Fashion as a business factor in mining enterprises has been frequently referred to in this journal. The mass of men who become miners through stock or partnership interests are very largely imitative in constructing their enterprises. Great individual successes, by which is meant the spectacular accumulation of individual fortunes in mines, bring would-be imitators of the success to investment in the locality of the mines, to the kind of metal mining in which the fortune was made, and even to the style of process employed in the mining. A development of imitative effort has made very large mines in the territorial sense a fashion at the present time. It is not at all uncommon to note mere dependence on bigness for success. It is sufficient with these optimistic people, to whom a million in a mine is a trifle, for them to find that the property submitted to their consideration is only a single twenty-acre claim. The profit possibility of the single claim is not a matter in point. It is only one claim. It is not big enough and is turned down to favor a weedy proposition with acres enough to make a stock farm.

To the uninitiated the presumption is that a mining claim must be a mine, and possibilities of future profit are measured in the direct ratio of the number of claims and the surface acreage. The presumption is not, however, a fact—that is, not necessarily. A claim, of the numerous kind so much in evidence in the representations of the promoters who trail on the skirts of a real mine success, is apt to be nothing more than the promoter's imagination plus a lead pencil and a hatchet. It is quite safe to start with regarding it as having about the relation to the real successful mine that the blanks in a lottery drawing have to the capital prize.

Mere bigness as a dominating element in the success of a mining enterprise is not essential. Aggregations of mines under one ownership equalize profits and losses, and reduce administrative costs. They do not reduce mining costs and their tendency is to reduce the efficiency of the prospecting and development work. There is developed a tendency to depend on averages and avoid risks of loss involved in prospecting when, as the owners say, "We are doing well enough." Prospecting and development work in mines are most effective in proportion to the concentration of effort. If the management of each individual property is dependent on that property alone for success the effort is apt to be more effectively directed than when it scatters. Mining does not make in the ground what does not already exist, it merely finds it and appropriates it. The directory of a mining enterprise introduces the element of the same kind of business comparison that it knows in manufacturing, and is apt unconsciously to hold its mine management to the same kind of responsibility. The two things are not the same and the mining is limited in its chance of success by considering them the same.

It is not to be questioned that there are many common utilities in which one management and one plant giving a common service produces a great economy. It is not questioned but that the mine conditions may make in many cases the big operation the only possible economical operation. These two things can be conceded as demonstrated beyond the necessity of debate to support them. But it is questioned, if the real mining which is the base of the business can be most successfully built up into units which include many separate or separable units of single mines.

A little reflection will show that the successful big mining enterprises are not based on aggregations of many mines, or on big areas of single mine ownership. The unit of success that is big, is a small area, a single mine, operated intensively, and it may be added, having within it the raw material for an intensive activity. Chances of success in mines are not increased by scattering the underground part of mining. They are really diminished. Mines are found in the first place by men who prospect for them for themselves. Hired prospectors have no great record of successes for the people who hired them. Even small areas in a mining district must be gone over many times, and again many times, before the possibilities of mines can be considered exhausted. Men will do this for themselves, risking the loss of their own time, but capital will not do it and risk the loss of its money.

THUNDER MOUNTAIN, IDAHO, DISTRICT is receiving a great deal of speculative attention at the present time. As a fact, however, very little is really known about it. Theories and claims of richness are the present substitute for actual facts. Many of the claims and some of the theories may later on be confirmed by the real facts as they will be disclosed by this summer's work of prospectors and miners. Among statements now made that should be taken with a good deal of reserve is the one that the entire mass of a rhyolite eruptive is gold bearing pay ore. Quite likely it contains the pay ore leads or chimneys, and these may be composed of the country rock itself without any physical difference in appearance to distinguish them from the barren country rock. It is absurd to claim more than this, and the statement would not require comment, except that it, and similar statements, may be the basis of fraudulent mining scheme promotions which react on legitimately based enterprises. There is no basis for the sale of mining stock on Thunder mountain propositions except the bedrock basis of a new district, in which one mine believed to have been made, is the presumptive evidence that there are others that can be made. Thunder Mountain district from the consensus of statements, more or less responsible, would seem to be a possible opportunity this summer for prospectors, miners, and the camp-following enterprises that are supported by them.

ON exactly what legal basis the assessment for taxation of mining claim locations is made by the county assessors, has never received a very lucid explanation. The land covered by the locations is public land of the United States, and, as such, it is not taxable in any State. The estate of the mining claim locator is not a fee, but a grant of that mineral portion of the soil which the miner can separate from the soil and make of it a chattel or personal property. The compliance with certain conditions vest the exclusive right in the locator to acquire this separable personal property. The act of location of the claim does not vest the title to the actual mineral property. No title to that can exist until it is separated from the soil and reduced to actual personal possession. Until it is so separated it is part of the public property. To restate more concisely: What the Government grants to the locator of a mining claim is an exclusive right to make personal property of part of the public estate. It does not grant a fee, nor does it transfer an ownership in personal property. What the States undertake to assess and tax is either or both of the two last-described things, which the Government does not give the locator nor does the locator possess. The real thing the locator has, and which the law has made grant to him of, namely, the right to make the personal property, is not assessed or taxed. Very slight consideration of what this is shows that it is only really taxable, if at all, as a license. After the locator has by the use of his right made personal property of any of the mineral in the land of his claim, that personal property is assessable and taxable. The tools, machinery and supplies a miner works with on his location are property which has an ascertainable value, and can therefore be assessed and taxed. It would seem that this matter of taxation of mining locations could be tested in the courts and won by the locators on the lines here suggested. It is a logical absurdity to assess what really is the present public property of the United States as if it were the property of one who actually only has a mere right of subsequent acquisition.

Gold Mining Tending to Lower Prices of the Other Metals.

It is but a comparatively short period of time since the terms gold mining, silver mining, copper mining, lead mining and zinc mining had definite meanings. Each was a branch of mining limited to fairly definite bounds. Metallurgical science had not then advanced to a point which took account of more than the principal metal in an ore. Then if one metal could be commercially obtained from an ore, the metallurgists were satisfied to merely eliminate the others. Exceedingly rich ores, carrying a mixture of the minerals of several metals, that could not be reduced by one or other of the practiced metallurgical methods for single metals, had to be thrown away.

The change of metallurgical science towards its present development has been constant, and latterly at a very rapid rate. It has largely broken down the old distinctions between the different kinds of mining. It can, indeed, be said that there are no longer any separable branches of metal mining, but only modifications of a standard practice. Ores are now mined for all of the metal in them. What was formerly wasted is now saved.

Gold mining which was formerly all either placer or quartz is now only largely these two. It has been extended in the commercial sense over what was formerly described as silver, copper, lead or zinc mining, and has been made inclusive of gold recovery from the complex ores which sometimes contain a little of everything. The commercial result of this is that as a result of mining for gold there is a large and constantly increasing production of silver, copper, lead and zinc as incidental products. Sometimes these operations are referred to as mining for one or the other of the other metals, but it will appear on consideration that the gold recovery was the real basis of the operation.

There is no competition in gold production. There is no market price to send up or down by supply and demand. The gold is itself the market measure. There is competition in the production of the other metals. There are always the elements of supply and demand affecting sale prices received by producers for these metals. With gold production, any of these other metals produced constitutes additions to the supply which do not come primarily to satisfy a demand for these metals. They would not be produced to supply a demand. Their sale on the market is largely unaffected by the cost of production. They are a by-product for which anything received is additional profit to the gold mining.

The aggregate of such non-competitive production is already large. Its proportion to total production is increasing. Take a single instance of a gold mining camp producing 2500 tons of ore daily, that contains only a dollar a ton more gold than will just pay all the costs of mining and metallurgical recovery, and with it 1.5% of recovered copper, that alone can not pay half of the costs. Obviously the camp could not exist dependent on copper production. Just as obviously it does exist on the gold production independent of the copper production. The latter has, however, to be produced to get the gold, and, produced, it is, of course, sold at its market price. But 1½% of copper from 2500 tons of ore is 75,000 pounds of copper daily and 22,500,000 of annual production, assuming 300 working days a year. This amount alone is a sufficient proportion of the total production to make a surplus which will depress prices. It is as well a production which agreements to restrict production will not restrict. The suppositious case here presented is practically the duplicate of an actual case, and of the kind it is only one of many, in which varying ratios of gold and copper contents, with or without silver, make commercial propositions based on the gold production.

The same condition exists with silver and lead; the former alone will make a commercial business on ores which contain large quantities of lead as a by-product. Such ores are mined and reduced for the silver. If the price of lead is high, so much the better. If it is low it reduces the profits, but does not wipe them out, and the mining and lead production go on just the same. Some of the silver-lead mines of British Columbia are producing lead simply because it is an unavoidable by-product of the silver production. It does not produce any profit to the miner, but it loads up the market and is bearing down the price of lead to the disadvantage of ores that can, if mined at all, only be mined for lead.

Zinc, with methods of saving it where it has heretofore always been wasted, is a by-product of some gold and silver production. It is simply a question of a little time when this kind of zinc production will aggregate a sufficient quantity to create a surplus of zinc production which will depress the price of zinc produced from what are solely zinc ores.

The tendency described as the effect primarily of the extension of gold mining is a real condition that can not be safely neglected in planning mining enterprises for the future. It will be found to be very largely the cause of the failures of the late efforts to permanently raise the selling prices of copper and lead. The copper price was broken down by a surplus of copper which was largely the production of gold mines. These gold mines are now an established condition of the copper mining industry, and must be taken into account in estimating the future profit of copper production.

THE definition of what constitutes ore in sight is receiving considerable discussion among engineers and mine operators. The personal equation has entered into its use rather more extensively than is compatible with the definiteness that an art that is to be ultimately an exact science should possess. Almost any one who has a mining claim that it is desired to sell writes for the promotion of the sale a descriptive paper which is by courtesy referred to as a mining report. The use of the term "ore in sight" in these literary documents is free and elastic. Any rock in place is ore in sight in many of these compositions. Others estimate it as being any of the mineral deposit exposed by a mine opening, quite regardless of its payable or non-payable quality, and quite regardless of whether of any ore body only one face is exposed, or three or four faces. Perhaps the closest limitation of the application of the term is to ore bodies which in the workings of a mine are exposed on not less than three sides, which only include the mass of ore which in place contains the pay mineral. The first use of the term is simply an evidence of ignorance of the meaning of the words by the user of them. The second use is a careless one. The close limitation of the third use overlooks the practical circumstances of mining, and can suggest misleading conclusions, though it is fully exact and correct in some circumstances. Broadened a little it will answer very well. Ore in sight should have a constant, unvarying meaning and should without explanation always describe the same definite thing. It is suggested that "ore in sight" should mean a body of rock in place, exposed by mine workings on not less than three sides, which, removable by the most economical mining methods applicable, shall contain of estimatable recoverable values at least the costs of obtaining them. This is sufficiently elastic to include as ore in sight the waste rock, not containing payable values, which in the most economical mining is unavoidably taken out and treated with the latter. It does not include such barren rock where the economical mining method separates it from payable rock before it receives metallurgical treatment. For example, a 4-inch wide streak of pay ore, if separable from the waste that must be mined out to get it, may be ore in sight. The same streak that cannot be separated from the waste may not be ore in sight.

Concentrates.

TIN or aluminum will dissolve in hydrochloric acid.

A MINER'S INCH should properly irrigate five acres.

THREE CENTS per barrel is the minimum cost of California crude oil production.

THE horse power of a boiler 66 inches diameter, 20 feet long, containing fifty-eight 4-inch tubes, is 98 H. P.

A 100-POUND FLYWHEEL, 15½ inches radius, 280 revolutions per minute, has a centrifugal force of 3451 pounds.

EXPERIMENTS extending through several years are opposed to the theory that wooden leaching vats absorb gold to any noticeable extent.

WITH illuminating gas costing 75 cents per 1000 cubic feet a 10 H. P. or 15 H. P. gas engine will cost to operate about 1¾ cents per H. P. hour.

WHERE a mining claim exceeds the statutory length it is not void, but the locator will be allowed to hold a claim 1500 feet long; the remainder will be rejected.

FREIGHT RATES on machinery such as gas or steam engines from Detroit, Mich., to Denver, Colo., are $2.30 per cwt.; to Santa Fe, N. M., $2.57; to San Francisco, Cal., or Seattle, Wash., $3.

A DIFFICULT but positive remedy for poisoning by water gas, which consists largely of carbon monoxide, is to place the victim in an atmosphere of oxygen at a pressure of thirty pounds per square inch.

THE energy of water flowing through a pipe that is used to overcome the frictional resistance to flow becomes heat. The iron of pipes and the water being both good conductors, the heat never causes a sensible rise in temperature.

A 1% GRADE is a rise of 1 foot vertically to 100 feet horizontally. A 1% grade gives, approximately, a resistance to traction of twenty pounds per ton. This rule is not absolutely correct, but for a 10% grade it comes within ½ of 1% of the truth.

THE oil pipe line of the Pacific Coast Oil Co. is 44 miles in length, a 2 and 3-inch pipe from Pico canyon to the sea at Ventura, Cal., delivering 600 barrels 41° oil every twenty-four hours, under a head of 1900 feet. The highest undulation is 200 feet.

USING COAL in a producer to make producer gas to operate a gas engine, a horse power hour can be produced for a pound of coal even with small engines. A horse power hour from a steam engine would require to produce it 2.2 pounds of the same coal.

IT is advisable, in shaping bits, to make as sharp a tool as the character of the rock will stand. Bevel the edge to a little sharper than 45° of angle. Make the bit square along the cutting edge, but leave a long taper of 60° of angle back to the body of the drill.

AN evaporation of 30 pounds of water from 100° F. into steam at 70 pounds pressure is equal to an evaporation of 34.488 pounds from and at 212° F., and an evaporation of 34½ pounds from and at 212° F. is equal to 30.10 pounds from 100° F. into steam at 70 pounds pressure.

THE diamond finds were made in the United States in 1901, in new localities. None of the finds has any anticipated commercial importance. The late discoveries of new fields that may become commercially important are in the Guianas and northern Brazil in South America.

FOR a 14-foot roadbed and 1½ to 1 slopes, the volume of a 20-foot fill for 100 feet is 3.259 cubic yards. For a 24-foot fill on the same basis there would be 4.444 yards—an increase of 26⅔%. A fill of 22.8 feet would have 4.070 cubic yards, and if it shrank 20% in volume, would equal a 20-foot fill.

IN electrical transmission of power as compared with belting or shafting the loss is proportional to the load, while with belting or shafting the loss is constant, and while it may be small in proportion to the total power at full load, yet being the same at a light load, it is a much higher percentage.

NATIVE ARSENIC is a gold precipitant. In a laboratory experiment, in which 15 gr. native arsenic were suspended in a weak solution of gold chloride, in 2½ hours the arsenic was yellow-coated, and in 12 hours two plates of gold were precipitated. The same result was obtained on passing a current of arseniuretted hydrogen through a solution of gold chloride.

ABOUT three-eighths of a gallon consumption of crude petroleum per stationary boiler horse power is a good result. A 150 H. P. boiler run ten hours daily would consume 412½ gallons, or ten barrels. A 75 H. P. boiler would consume half of this quantity, or five barrels in ten hours. Exact figures can not be given, as so many elements are indeterminate until the actual trial is made.

THE big fills in railroad work made by the Canadian Pacific Ry. Co. at Mountain creek embankment are by application of the early California hydraulic mining idea. Water is brought to a point 200 feet above the track and conducted in iron penstocks to where needed; from 5-inch nozzles a stream cuts the bank, the current carrying material in suspension through a flume to the point to be filled.

ELECTRIC street cars are propelled by electric motors attached to the car track, driving the axles by means of gearing. The current is taken from the trolley wire through the trolley wheel and conductor carried by the trolley pole, thence to the controller on the front platform, and from there to the motors under the car. The current returns to the generator at the power house through the rails.

THE cyanide process is not directly applicable to ores containing 2½% of copper, though the mineral form in which the copper occurs might modify the broad statement, accepting the claims of successes with some experimental work. If, however, the copper mineral can be sufficiently removed by concentration, the tailings from it may be possible of commercial treatment by the cyanide process.

ARCHÆAN GRANITE is a descriptive geological term used to describe the time relation of a granite to sedimentary rock formations adjacent. It would mean that the period of formation of the granite, its appearance as solid rock in place, was in the Archæan era, the earliest of the geological eras. It is also used to define a granite formed by the metamorphism of an Archæan sedimentary rock.

IN the case of the State vs. Baker, 61 Pac., 882, the Second Judicial District Court of Montana decided that a location of a mining claim properly made operates, even before patent, as a grant from the Government; and the estate acquired under it is a vested right to the fee, which becomes absolute upon the performance of the required conditions. It can be lost only by abandonment, or by forfeiture and relocation by another.

WHERE the locator of a mining claim allows his title to lapse by reason of non-performance of required annual assessment work, and the claim is legally relocated, all improvements made thereon, and upon the claim at the time the second locator has perfected his location, become the property of the second locator. The original locator has the right to remove any and all improvements before the claim has finally passed out of his possession.

THE mean effective pressure of an engine utilizing one-half a cylinder full of combustible mixture is about 60% that of the ordinary gas engine. The cylinder capacity of an engine maintaining a higher efficiency by greater expansion must be about twice the capacity of the ordinary gas engine cylinder for the same power developed. The same may be said of a steam engine utilizing the expansion of the steam compared to one without cut-off.

FURNACE flue dust is best treated by bricking and re-smelting. A bricking mixture may be made of fine flue dust and 10% lime, or 20% dust, 5% slacked lime and 75% siliceous ore. When the latter is free from sulphur, 3% fine coke may be added to furnish necessary fuel for burning in kilns. Bricks are from eight to ten pounds in weight and are dried in the air, or, better still, in dry chambers. They may also be burned in ordinary brick kilns.

THE Diesel motor has been illustrated and described herein at length. It is essentially a gasoline engine, adapted to use crude petroleum or other oils direct. It operates on the four-stroke or Otto cycle, but differs from other internal combustion motors in compressing a full charge of air to a point above the igniting point of the fuel, then injecting this fuel for a certain period into this red-hot air, where it burns with limits of pressure and temperature under control.

WHERE, in the 4 H. P. vertical style, the scale is $\frac{3}{16}$-inch thick on the tubes and part of the plates, get a boiler oil feeder, and, using kerosene oil, feed four drops per minute when the boiler is in operation, and until the scale begins to drop off, after that, two drops per minute. Should this occasion foaming reduce the rate of feed enough to avoid such foaming. The boiler must be frequently cleaned or else the scale dislodged by the oil will gather on the crown sheet and make more trouble.

THERE is a State Mining Bureau in California, supported by public taxation. It is the only institution of the kind in the State. The California State Miners' Association is on entirely different lines. It is a voluntary Association, supported by private contributions, and, while the two work in harmony, their formation, province and purpose are entirely distinct. E. H. Benjamin, 331 Pine St., San Francisco, is secretary of the California State Miners' Association, and L. E. Auhury, Ferry Bldg., San Francisco, is State mineralogist and chief executive officer of the Mining Bureau. Either can furnish complete data regarding the organization with which he is connected.

ACCORDING to the findings of the U. S. Court of Appeals in Stark vs. Geyser-Martin G. M. Co., a Utah case, the word "trustee" on a mining stock certificate has a specific meaning. It is a warning and declaration to every one who reads it (1) That the person so named is not the owner of the property to which it relates; (2) that he holds it for the use and benefit of another; (3) that he has no right or power to sell or dispose of it without the assent of the real owner. It signifies the opposite of the word "owner," and the term "trustee" is a term of administration and not of sale. The Court further held that the case was not affected by the fact that it is the custom among brokers to carry in their names as trustees the stock of third parties and to assign and transfer it without the consent of the third parties.

THE newest process of refining and mixing asphalt is as follows: A tank 10 feet by 10 feet by 15 feet high is filled with coils of 1¼-inch pipe not more than 6 inches apart. These coils are made of extra heavy pipe, well braced and protected, so that they will not be damaged by lumps of crude asphalt falling on them. In one of these tanks there are about 4500 linear feet of pipe, thus ensuring sufficient heating surface. The horse power required per tank is about 125, and the amount of water evaporated from each charge of asphalt is 28,000 pounds. To keep the mineral matter from settling, perforated steam pipes are placed in the bottom of the tank, from which the escaping steam keeps the mineral matter in suspension. At the temperature of refining the asphalt is liquid, and after all the water has escaped it is run into barrels and shipped.

LITTLE reliance is to be placed in any advertisement of mines or mining stocks in Eastern papers. This is a sweeping statement, but the facts justify it. What are considered "reliable" newspapers offer their editorial columns to indiscriminate "puffs" of any scheme, however swindling or worthless. Even the Boston Traveller—once considered a staid, steady, conservative journal—prostitutes itself that way. It offers to publish an editorial article endorsing any wildcat mining swindle that will give it an advertisement of 150 lines. To the credit of Western journalism, it is to be said that the papers in this west half of America are very few that would listen to such a proposition, much less make it and boldly proclaim the disgraceful fact. A leading New York City advertising agency announces its ability to get any kind of a "business" statement in the daily press under the head of telegraphic news, with a regular date head, just like bona fide news, for so much a line. Such procedure is a crime, but is daily practiced by those who know better.

THE pressure gauge employed on a steam boiler indicates the pressure on 1 square inch in the boiler in excess of or above the pressure of the atmosphere. The pressure in the boiler must balance the pressure of the atmosphere before the ordinary boiler gauge will indicate any pressure. This may be proved by attaching a vacuum and pressure gauge to a suitable vessel in which a vacuum may be created. As long as a vacuum exists it will be indicated by the vacuum gauge, showing that the pressure within the vessel is less than that of the atmosphere. When the pressure rises the pointer on the vacuum gauge will approach zero, attaining this position when the pressure in the vessel equals that on the outside. The pointers on both gauges will now be at zero, but as soon as a further increase in pressure is had the pointer on the pressure gauge will be seen to move away from zero, thus indicating only the pressure in excess of that of the atmosphere. The absolute or total pressure in the vessel when the latter gauge indicates one pound will therefore be 14.7 + 1 = 15.7 pounds.

"HURDLE DIKES" consist of a row or rows of clumps of piles driven about 4 feet center to center, so spaced as to give about 1 per running foot of length of dike. Their penetration depends on the nature of bottom, depth of water, etc., but would usually be from 15 to 20 feet at least. They are arranged in clumps by staggering their heads, which are drawn together and strongly tied with wire rope. The head of dike is given a trail down stream to throw off the scour of the end eddy. At the shore end the tops of the piles are kept at about high flood level, and are given a slight slope towards the head. The dike should be protected on all sides by mattresses sunk on the bed of the river. The object of the dike is to divert the current of the river. Its action is to slow the current and cause deposit of silt below it. Being permeable, it is not so severely exposed as in a solid groyne and its action is certain. The strength of the hurdle—that is, number of rows of piles, etc.—should of course be made to fit the conditions of the site of the dike. On the convex side of a river, where only the stream end of the dike is much exposed, the shore end clumps require but little strength, while on a concave bank the whole of the hurdle should be designed to withstand a heavy discharge against it.

"AMORTIZATION" is putting aside a certain amount of the mine's surplus earnings each year for the purpose of redeeming the capital when the mine is worked out. While many consider the idea a sound one, it is not put in practice much. In some European instances amortization goes beyond mere theory; but, in the United States, almost invariably the shareholders in a profitable mining corporation prefer to act for themselves, on the general principle that a man always feels more secure when the settlement of his financial affairs rests with himself, even though he may lose eventually. Where a company adopts the principle of amortization of its capital, the directors have to accept the responsibility of the safe investment of the funds set apart for that purpose—a responsibility which would be no light one, and which would increase in proportion to the value of the mine. Then, again, would come the question who should receive the benefit of such provision—in the majority of cases not those who provided the capital originally. Usually the original holders dispose of their shares long before the expiration of the life of the mine. The accretion in value, due to the fact that amortization of capital was being provided for, would rarely be fully reflected in the price of the shares; and, if it were not the original holders who sold their shares before liquidation, would not benefit to the extent to which they would be entitled. Right here is apparent the difference between a mining and a manufacturing corporation, the former being limited solely to the working of an asset of a terminable nature, and whatever theories may be entertained, the rule will popularly continue of dividing, proportionately, among the shareholders the excess of current receipts over current expenses.

The Treatment of Clay Slimes by the Cyanide Process and Agitation.*

NUMBER V.—CONCLUDED.

By E. A. H. Tays and F. A. Schiertz.

Storage Tanks.—Two of the original sand tanks, 20 feet in diameter and 5 feet deep, were fitted up for storage tanks, from which the solution was run to the zinc boxes. These were in line, at the end of the line of tanks nearest the precipitating room, and connected on a line with the bottom by a 4-inch pipe. The settling box discharged through a 4-inch pipe into the farthest of these two tanks (No. 1), the pipe being carried straight down to the bottom and discharging horizontally towards the farther side. A 4.5-foot stand pipe, set in a loose elbow on the end of the 4-inch pipe connecting this No. 1 tank with its mate, No. 2, was arranged so that it could be lowered, when necessary, in order to drain No. 1.

In this way No. 1 became full before it discharged into No. 2. On the end of the pipe discharging into No. 2 was put a T, and a 2.5-inch stand pipe set in this reached above the top of No. 2. This brought the air to the surface without unduly stirring up the solution discharged into No. 2. In No. 2 were fitted at intervals three 2.5-inch rubber hose, 7 feet long, attached to a wooden float that kept the intake about 2 inches under the top of the solution, whatever its level. In this way the solution was run to the zinc boxes through 3-inch pipes. The bottoms of these tanks were about 8 feet above the floor of the precipitating room, and the constant head in the pipes to the boxes averaged about 8 feet. With this arrangement the solution ran to the zinc boxes comparatively clear, but not absolutely so, as it always was upon leaving the boxes. More or less fine slime was deposited on the zinc, which increased the amount of precipitates produced and gave these a reddish color after running through the filter press.

Zinc Boxes.—From the storage tanks the gold solution was run to and through the zinc boxes. The "first solution" charge was decanted at about 0.5% of KCy, and the "second," or "wash," at about 0.03%. These were both pumped into the same storage tanks, and contained, as mixed, between 3 and 4 grams of gold and from 5 to 6 grams of silver per metric ton (1000 liters), the average strength in KCy being between 0.03% and 0.05%.

We had a set of ten boxes and three barrels for holding the zinc. Of the boxes, seven were of sheet iron, one of wood, with five compartments each 12x16 inches and 19 inches deep, and two wooden boxes with four compartments, each 30 inches wide, 15 long and 15 deep.

The barrels were 2 feet in diameter and 2 feet deep to the screen bottom, and had 6 inches clear space between screen bottom and the bottom of the tank. These three barrels, constituting one apparatus, were filled with zinc shavings, about 6 cubic feet in each, or 18 cubic feet in the three.

The solution was delivered to the first of these barrels through a 1-inch pipe, directly in the center, running down to and discharging against the screen bottom, which was of 0.25-inch mesh. It then came up through the zinc and discharged through a 1.5-inch pipe near the top, that ran over to and down into barrel No. 2, delivering the solution in the center and against the screen bottom; then, rising through the zinc, discharged near the top through a 1.5-inch pipe into No 3, where the operation was repeated, the solution discharging through a 1.5-inch pipe from near the top into the trough leading to the sump tanks. These zinc barrels were set about 1 foot apart, each about 8 inches lower than the next preceding, and so connected that any one could be cut out and cleaned while the others continued working. From 1.4 to 1.7 ton of solution per hour was run through, giving, as a rule, almost perfect extraction. In fact, their work was just about as good as that done by the boxes.

Each of the large boxes held 15.6 cubic feet of zinc and passed about 1.1 ton of solution per hour. Each of the small boxes held 10.2 cubic feet of zinc, and passed about 0.8 ton of solution per hour. These small boxes gave us the best general results and can be recommended as a standard.

Every 4 h. 0.5 kilo (about one pound) of cyanide was put into the first compartment of each box. We considered that this was beneficial, as it tended to keep the zinc "sharp." The solution, after leaving the zinc boxes, was conveyed to the two large sump tanks under the floor, where it was made up into standard solution by the addition of the necessary cyanide, and this, as needed, was pumped up to the trough, to be mixed with the slimes for a new charge.

Whatever suspended matter the solution carried was precipitated in the zinc boxes. We never found it any detriment to good precipitation, except that it required clean-ups to be more frequent than would have been necessary with a filtered solution. The slimes left in the zinc boxes also augmented the volume of the material to be smelted and reduced somewhat its percentage of gold.

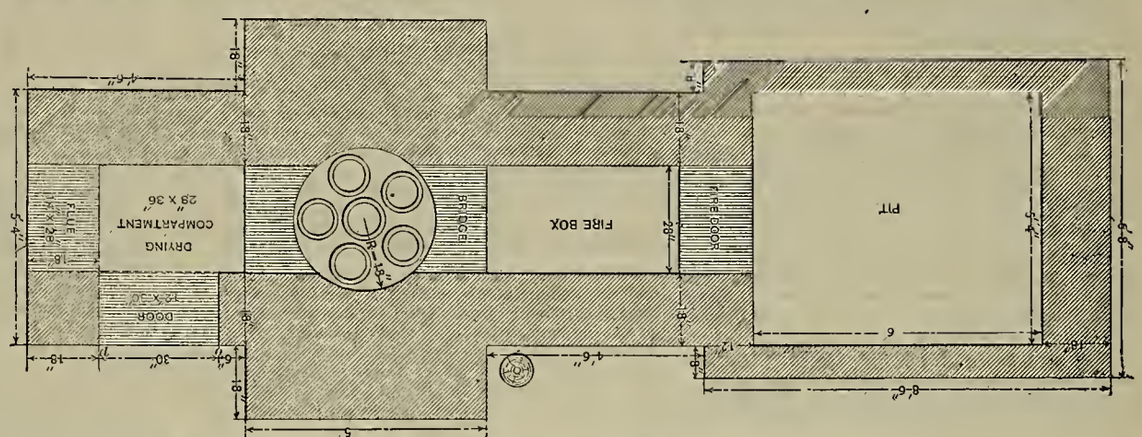

Fig. 5.—Plan of Furnace for Smelting Gold, Silver, Copper and Aurocyanides, With Wood as Fuel.

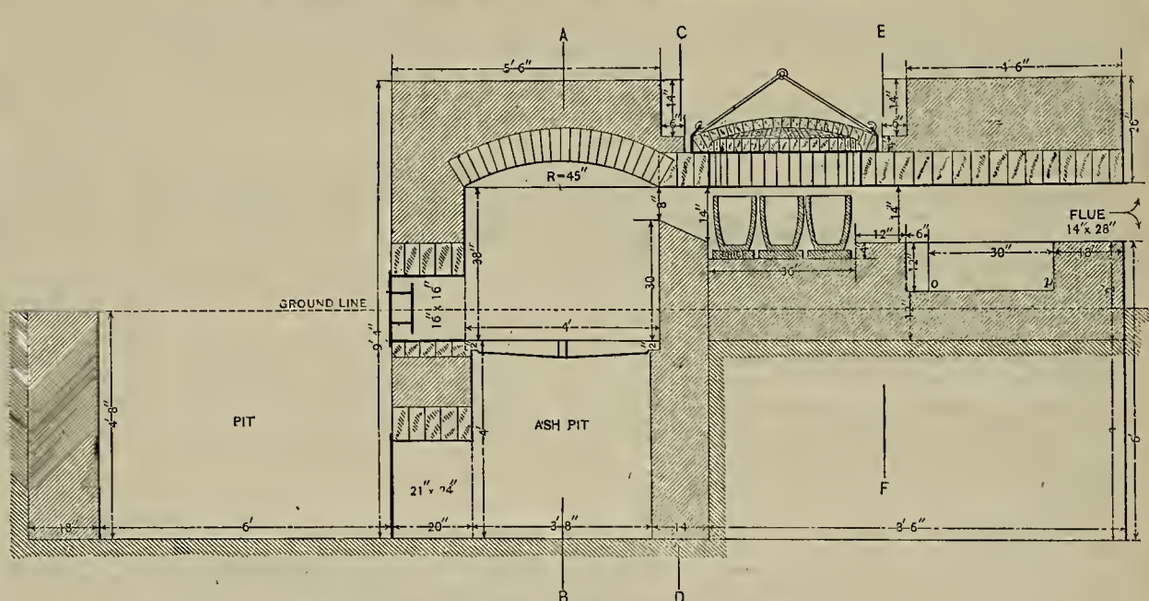

Fig. 6.—Smelting Furnace; Vertical Longitudinal Section Through Fig. 5.

Each box or barrel was cleaned in turn once a week, and toward the last the head compartment of each was cleaned out every four days and charged with fresh zinc.

We turned the zinc on the premises, making the shavings as wide as possible, but using even the fine dust, of which there was but little, care being taken to feed it with the coarser shavings as well intermixed as possible. The consumption of zinc for the whole run of eleven months averaged about 0.9 pound per ton of slimes treated. We discovered that good precipitation did not depend so much on the size as on the freshness of the zinc shavings. In fact, we now judge that the finer the shavings the better; but this point may be contested. That, in order to secure a perfect precipitation, the zinc used must be freshly turned, there can be little doubt. As already observed, the zinc was turned on the premises. After a while, there came to be nearly a month's supply of zinc shavings on hand. That used daily was naturally taken from the top, and, consequently, was nearly always freshly turned. Every precaution being taken to secure good results, the average precipitation for the first six months was over 95%. About the end of February the supply of zinc disks then on hand had been turned into shavings, and we began to use up the surplus pile. Within a week we had trouble with the zinc boxes, the precipitation going at times as low as 81%. Everything was done that could be thought of to remedy the evil, but it still continued. We noticed, however, that the box that was last charged with zinc did the worst work for that day. Towards the end of the month, judging from the irregular results from all the boxes, some good and some exceedingly bad, we decided that the trouble must be in the zinc. The turned zinc on hand lasted just through the month, and the average precipitation for that month (March) was only 93.59%; whereas, for the preceding month it had been 97.70%. The next month, starting on a new lot of zinc disks, we took care to turn only just fast enough, so as never to have on hand more than a day's supply of shavings in advance, and always to use of those on hand the first, and not the last, turned. From the outset the precipitation in the zinc boxes was all that could be desired, and the average precipitation for the month was 99.22%. Samples of the solution were taken from the heads and tails every hour, and for the assay samples 400 grams (about thirteen assay tons) of each were evaporated, with a little litharge, on an enclosed sand bed, heated by steam.

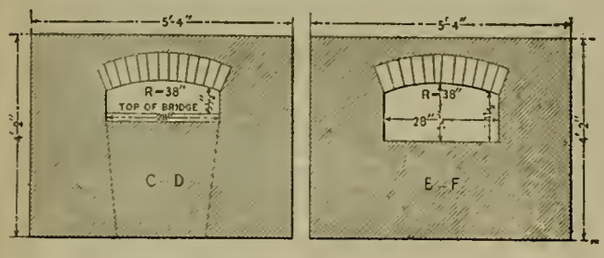
It would seem from this experience that, for perfect work in the zinc boxes, freshly turned zinc is a desideratum. After a few days' exposure of the zinc shavings to the atmosphere, an imperceptible film of oxide forms, and, although bright and fresh to the eye, offers resistance to the action of the solution. This is undoubtedly remedied by the use of lead acetate, recommended by some operators; this slight oxidation is, undoubtedly, the cause of the need of the acetate. We had no trouble in getting a precipitation of 98%, when using freshly turned zinc, from solutions running as low as 0.01% and 0.02% KCy and carrying some suspended matter in the shape of impalpable slimes. In cleaning out a box, all the zinc was washed on a 0.25-inch mesh screen over a 30-mesh screen, and all the zinc remaining on the coarse screen was returned to the boxes, new zinc being added to complete the charge. The fine zinc and slimes that went through the 30-mesh screen were run through the filter press and stored away, ready for smelting.

The coarser, which remained on the 30-mesh screen, was treated in specially prepared barrels with dilute sulphuric acid, washed, and also stored to await smelting.

Reduction of the Precipitates to Bullion.—The

*Trans. American Institute Mining Engineers, Mexican meeting, November, 1901.

product yielded hy the zinc hoxes was of rather low grade, very seldom assaying over 3.25% in gold and 4.50% in silver; hut it carried from 7% to 15% of copper. The fine zinc, before it was removed from the 30-mesh screen, was thoroughly washed and had the usual black color, whereas the pressed precipitates were red and at the first had the same muddy consistency as the material of the tailings dump.



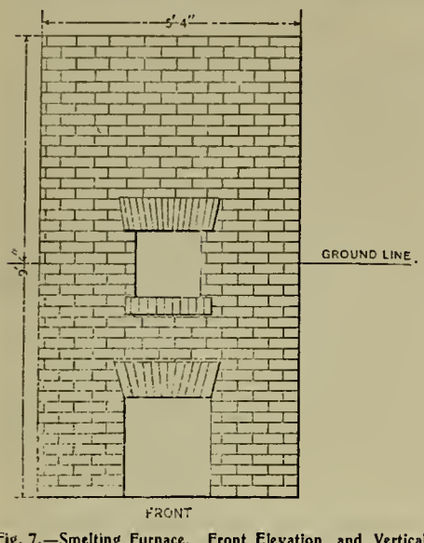


Fig. 7.—Smelting Furnace. Front Elevation and Vertical Sections Through C–D and E–F, Fig. 6.

Acid Treatment.—When we started the slimes treatment, precipitates and zinc were treated with dilute sulphuric acid in 2x3 foot wooden harrels, two parts of precipitates heing mixed with one part of zinc.

It was found, however, cheaper and more convenient to treat the zinc hy itself with dilute acid (two parts of water to one of concentrated acid). After ehullition had ceased, the harrels were filled with water and the material was washed for six days.

It was also noted that the use of hot water was more satisfactory than that of cold.

The following are two analyses of the material as smelted. Analysis I represents the mixture when precipitates and zinc were heing treated with acid. In No. II only the zinc had been treated with acid.

	I. Per Cent.	II. Per Cent.
Au	3.395	2.288
Ag	4.981	2.8955
Cu	6.955	12.15
Zn	16.148	20.15
Fe_2O_3	0.094	2.15
Al_2O_3	7.426	8.45
$CaSO_4$	28.32	26.86
SO_3	1.523	0.955

As has heen shown, these precipitates were rather too low in grade to he smelted on the premises, especially as there were no facilities for smelting on a large scale, and also in view of the large amount of flux needed. However, constant shortages—as high as 5% at times—in the returns from the smelting company, necessitated our shipping hullion, instead of precipitates, from the plant.

The furnace used for smelting was huilt on the principle of the hullion pot furnace, hut to hold six crucibles and to be fired with wood instead of charcoal, which was the available fuel for assaying and melting hars. Figs. 5 to 8 inclusive show the details of the construction of the furnace.

The firehox of the one we huilt was somewhat out of proportion to the rest of the furnace; hut, as old materials were used for the construction, it did not seem advisahle to spend much time in alterations. The front of the furnace was an old hoiler front that was lying around and the grate hars were the same as were used in one of the 60 H. P. boilers that ran the stamp mill. Notwithstanding the apparently excessive size of the firebox, the furnace did not use a large amount of wood and heated up rapidly and well. In melting copper all that was necessary was to carry a heavier fire, and it did not take very long to melt 60 kilos of copper in a No. 50 crucihle. In melting precipitates the average daily consumption of wood was 0.6 cord.

When melting was started, considerable trouhle was caused on account of the crucihles heing eaten through, sometimes not lasting more than one day, and it was noticed that just the top of the slag would have the corrosive action, eating a ring ahout 0.75-inch wide through the crucible. This top layer of slag was found to be white, with a disagreeahle taste, and a few qualitative tests showed it to be apparently a mixture of calcium and alkaline sulphates. The addition of some hematite iron ore, which happened to be on hand, was tried and improved matters considerahly, having a much more heneficial effect than the addition of pieces of scrap iron.

After long trials, the charge for smelting was finally fixed at the following mixture, in kilograms: 100 precipitates, 34 horax, 24 sodium hicarhonate, 5 sand, 6 clay, 3 ashes and 5 hematite.

The crucihles would he filled in the morning and refilled, as the previous charge melted down, until in the afternoon they were finally full. In this manner 120 kg. of precipitates would be melted in from ten to twelve hours, depending on the heat of the furnace.

The daily products were hullion, matte and rich slag.

Each crucihle yielded a disk of hullion weighing from 1 to 2 kg. When enough had accumulated, these disks were remelted and cast into hars, which assayed about .300 fine in gold and ahout .330 in silver, the halance heing made up of copper, iron and zinc.

The matte yielded hy each crucihle charge weighed ahout 2.5 kg. This matte was resmelted at the end of each month with an excess of scrap iron. Each crucihle, nearly full of molten matte, would yield from 15 to 20 kg. of bullion, in which, however, the silver was much in excess of the gold. No separate assay, however, was made, as this hullion was always mixed in with the other bullion. The final matte thus ohtained was rich in copper, iron and silver, hut carried very little gold. The matte ready for shipment assayed 20 grams of gold and 84,400 grams of silver per metric ton.

The slag ohtained from smelting was rich, running from $500 to $600 per metric ton. This slag, as it accumulated, was run over a lead hath in a Mexican vaso, which extracted hetween 92% and 95%. The waste slag from this vaso was not treated further, as the values were too low to warrant running it over again, although, hy such additional treatment, it could have been hrought down to $2 or $3 per metric ton.

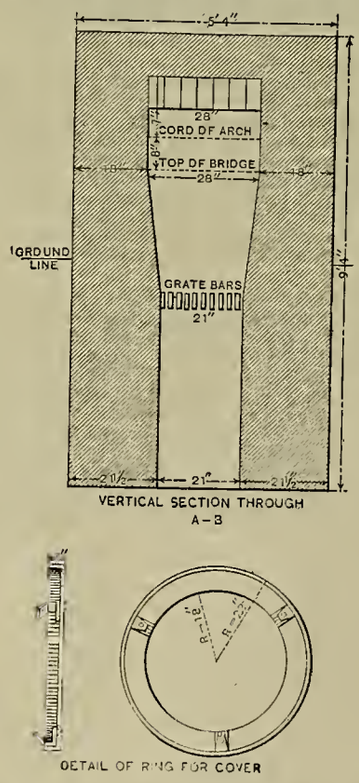

Fig. 8.—Details of Smelting Furnace. (See Figs. 5 and 6.)

Conclusion.—From what has heen written, it will he seen that we successfully treated a material that offered every incentive to let it alone, had it not been for the high gold values it contained.

A good idea of the physical character of the slimes was given hy our experience as to the effect of floods upon them. Before the first flood a rock falling anywhere on the surface of the dump would splash mud in all directions. A hog running at full speed jumped over the ridge at the upper edge one day and went out of sight, never to appear again.

Yet, while any weight would sink down through the jellylike mass, it was of such consistency that it would stand in hanks 8 feet high at an angle of 80°. When the first flood came, it went over the dam 4 feet deep and 50 feet wide, and in a few minutes carried away the earthy and rocky portions. This large volume of water rolled over the face of the slimes and in the two hours it lasted at full force did not cut it hack 10 feet.

The next morning there was an excavation at the foot of the dump cut, 6 feet deep and 20 feet across, down into the hed of the creek, in solid gravel, many of the houlders washed out weighing as much as fifty pounds. A rock thrown with ordinary force against the face of the dump would sink in at least a foot. A man standing out on it would have sunk through to the hottom. Out hack from the edge, where a stream was going over the face in a volume 10 feet wide and 1 foot deep, a rock alighting would splash mud and sink out of sight; yet the water could not cut the face hack 5 feet a day. At the next flood an immense volume rolled over the face to a depth of at least 4 feet, and, to all appearances, the face might as well have heen solid rock, the water seeming to make no impression on it whatever.

After over a month a steady stream and four floods had made hardly any further impression on the hody of the dump. The small constant stream seemed to have greater effect than a flood, for in a month's time it had gradually carried hack a cut some 8 feet wide, down to the creek hed, for ahout 200 feet.

The cost of treatment per ton was ahout $5 gold, divided as follows:

	Value.	Per Cent.
Cyanide, 7.31 pounds	$2 05	40
Zinc, 0.93 pounds	18	4
Administration and labor	99	20
Royalty	50	10
All other expenses: Materials, bullion, insurance, etc.	1 26	26
	$4 98	100

Under materials are included wood, acid and other supplies used in improvements and repairs. Of the last item, the hullion costs constituted ahout one-half, or 13%, of the total costs, made up of 8% for reduction expenses and 5% for freights, duties and commissions. Royalty was another heavy extra expense, heing 5% on the gross output.

Our total expense of $5 per ton compares very favorahly with the average cost of the treatment of the sands hy percolation, which was $7 per ton.

We helieve that, under like conditions, such as distance from the coast, the necessity of hringing in everything on mulehack, etc., no better can he done anywhere in Mexico. The only possihle further reduction in cost would he the consumption of cyanide, and that would depend wholly on the mineral and chemical character of the ore. We could have worked to hetter advantage had the plant heen huilt for the work, instead of heing an old plant altered and adapted, as far as possihle, to the new requirements.

The Detroit Copper Co. Concentrator at Morenci, Ariz.*

[STAFF CORRESPONDENCE.]

The Detroit Copper Co. concentrator, illustrated on the front page, handled 515 tons of ore per day during the month of Decemher, 1901. It is provided with crushers, screens, jigs, Chilean mills and various types of concentrating tahles. All this machinery is operated hy five gas engines of English make. The ores concentrated are sulphides, 75% of the product heing saved hy the jigs. By means of classifiers, settlers and tahles a specialty is made of the slimes. About 150 gallons of fresh water per minute are taken into the mill and ahout 1800 gallons are constantly in circulation. The system devised hy Supt. G. E. Hunt for settling the slimes, clarifying the water and pumping the latter hack to the head of the mill for redistrihution is one of the most interesting features of the work. Every gallon of the mill water, with the slimes it carries, passes through one of Mr. Hunt's automatic samplers on its way to the last settling tanks. Results, it is claimed, show the final tailings to contain ahout eight-tenths of 1% copper. The system of settling and clarifying is so perfect that the returning water is tolerahly clear. The mill operates in two sections, either one of which may run independently of the other. It is stated that this mill effects an 85% saving of the copper values, concentrating ahout seven tons to one ton.

At the smelting plant of the Detroit Co. there are five furnaces, which discharge direct to the converters. The furnace hlowers are run hy electric motors and they in turn hy two Westinghouse vertical gas engines. The converter hlast is supplied hy a steam-operated air compressor.

Morenci, Ariz., Jan. 21.

*See illustration on front page.

One of the newest patent applications for electricity is in making a more convenient faucet than that ordinarily used. Two pairs of electro-magnets are suspended from the walls, each pair heing mounted in such a way as to drive a piston up or down, according to which hutton is pressed. In this manner the piston opens or closes either the hot or cold valves and allows the water to flow into the howl.

The Auditing of a Mining Company's Accounts.*

By CHARLES V. JENKINS.

The comprehensive audit of the accounts of a mining company is extremely important in its relations to the legal situation and obligations of the corporation, the personal liability of the directors, and the interests of the investing public. A consideration of the subject as affecting the professional duties and fixing the responsibility of a mining engineer engaged in the expert examination of a mine, or in charge of mining operations, is equally important, though this phase of the question is not often presented systematically.

Business customs have pretty clearly established the purposes and principles of an audit. But in the absence of statutes compelling strict periodic investigation of their financial affairs, many companies of excellent repute do not avail themselves of the advantages afforded by such an audit. On the other hand, the failure of many companies to make public the true state of their affairs by means of an adequate financial audit is the frequent cause of loss to investors. The value to both parties of a systematic and thorough examination of company accounts is becoming, however, more and more generally appreciated; and it is to be hoped that this may result in suitable legislation, requiring an annual audit of the accounts and financial affairs of all private corporations, and providing for the license and registration of competent, professional accountants. Such a rule would tend to eliminate that element of fraud and the consequent danger of loss to which the stockholder is exposed, when he is forced to rely upon officials for information relative to the standing of the company in which he is interested. True, a financial audit offers no protection against the false or erroneous statements of the condition of the mine itself. Nor will it assist stockholders in penetrating the mysterious reticence or paradoxical ambiguity with which boards of directors muzzle and muffle their reports regarding the present condition and future prospects of their mines—a policy of concealment and of mystification which operates, as positively as tangible fraud, to enhance the element of speculation present, in varying degree, in all mining enterprises.

But it is safe to say that in a mining venture, where risk is always expected, capital will more readily seek investment, and stockholders will more cheerfully assume risk and more willingly assume any reasonable policy of a board of directors, if good faith and frankness are shown by regular and comprehensive reports and audits.

THE VALUE OF AN AUDIT.—The value of a commercial or general business audit depends upon its purpose, its minuteness of detail, the authority and responsibility of the auditor, and the scope of his instructions. The duties of an English chartered accountant, acting as an auditor, are defined, and, to a certain extent, specified by the "Companies Act" of 1862, which compels an annual audit of all registered joint stock companies. The United States law has a similar provision, compelling the examination of all national banks by qualified government examiners. But so far as other corporations of private enterprise are concerned, an auditor's duty consists in performing that for which he is employed, and he is responsible to his employer only. If his appointment depends upon the good will of the company's officials, the presumption is that he will act as their agent rather than as the agent of the stockholders; or, if he be engaged to examine accounts and report upon some particular question, it is not likely that he will take it upon himself to extend his examination and report to cover more than that question. For instance, if he is asked to ascertain whether a reported reserve fund is real, or exists upon paper only, and how the said fund is invested, or to say whether, in his opinion, the working capital is sufficient, he would discharge his duty by a partial examination of the accounts and a report upon the one question submitted to him. But when a complete audit of the accounts of a mining company is required for the purpose of presenting to the stockholders a statement exhibiting the financial position of the company, and furnishing data which may possibly assist in deciding upon future operations, the auditor, if employed as the agent of the stockholders, will exhaustively examine and check all books of account and all the financial affairs of the company.

INSPECTION OF ACCOUNTS BY MINING ENGINEERS.—In examining a mining property for clients who contemplate purchase, the mining engineer often finds it necessary to make an exhaustive search through the accounts and records previously kept by the owners of the mine. This is, perhaps, most frequently the case when it is desired to ascertain the actual cost of mining at a producing mine. If such a mine has been operating sufficiently long to have established a fairly uniform cost, he may be warranted in accepting the figures given by the owners, supplemented by only a cursory inspection of the accounts. But in case of doubt or suspicion it may be desirable to verify the figures given. While some mining companies, in calculating the cost per ton of the ore extracted, include all expenses of dead work, development, exploration, etc., many others state as the cost of extraction work the actual expenditure for stoping and hoisting only, treating the development work, especially in shaft sinking, as a "capital" expenditure. Practice in classifying expenditures in this respect, and the arrangement of accounts relative to mine costs, is so varied that an engineer can satisfy himself only by an examination of the books, if he would know what items are included in the costs. Particularly in considering a "low grade" proposition, where accurate data are absolutely necessary, it is an immense advantage to be able to determine in detail, by personal investigation, the actual facts.

Of course, the present worth of a mine cannot be determined by the amount of its past dividends; yet, in many instances, the gross earnings, as represented by the tonnage and value of ore already produced, may have a signal importance in considering the future relation of profits to operating expenses.

The value of the product of the various stopes, as shown by the record of ore sales, affords the closest possible check upon the values obtained by sampling the several ore bodies from which ore has been shipped. A determination of the tonnage and value of "ore in sight" is naturally the first consideration of the engineer. But in his judgment of the mine as an investment, the item of costs is a factor of equal importance. From no other source can he obtain such accurate detailed information relative to the costs and charges of mining as from the books and past records of the mine under examination.

THE CONDUCT OF AN AUDIT.—Since the mining business is so radically subject to local conditions, it is to be expected that the forms of records and accounts will be varied to suit each special case. And, although the principles of accounting are fixed, there exists almost as great a diversity in the system of accounts in use as in the forms and registers employed. With due appreciation of the difficulties likely to arise from this lack of uniformity, the following general suggestions are offered as to the manner of conducting a practical audit of mining accounts.

In the majority of instances, a mine is owned and operated by a corporation, the main or financial office of which is far from the mine. This makes it practically necessary to consider two sets of accounts: Those conducted at the mine, which directly concern the mine management; and those belonging to the province of the secretary, which constitute the permanent financial records of the company. The mine office accounts, in full detail, together with vouchers, are usually forwarded at regular intervals to the main office, where a general audit is made, there being at the mine office but a local audit or checking of the accounts. For the present purpose, however, it may be assumed that all the records are kept and all the accounts conducted in the office at the mine.

LIST OF BOOKS.—In order to plan an intelligent dissection of the accounts, it is necessary to know how they are put together. To this end it will be well, first, to secure from the person in charge an explanation of the system employed, with a list and description of the books used. Indispensable, of course, to the double-entry set of books usually kept at a mine, are the cash book, journal and general ledger. In addition to these, and to the several subordinate record books, blotters, etc., which convenience demands, a well regulated system of mine accounts ought to include books of ore shipments and of mining costs. The former should show in detail the lots of ore sold at the mine or shipped, identifying each lot by number, and giving date of shipment, weights, terms of settlement, values, and net returns, and also specifying the stope or heading in the mine from which the lot was mined. The costs book, in the nature of an independent or special ledger, is kept to relieve the general ledger of the burden of the many accounts necessary when accurate record is made of the costs chargeable to each separate place of working in the mine. Cost keeping is one of the most important departments of mine accounting; and the costs book, when properly conducted, is a regular monthly statement and analysis of costs, itemizing the cost of labor, material and supplies, and distributing the power and operating charges, and the indirect or fixed and general expenses. Moreover, it is also a special ledger, containing an account with each place of working, in which are charged monthly the itemized costs as above, and from which are carried, by journal entry, the totals only of the month's expenses to a "Costs of Mining" account in the general ledger.

The general ledger is considered the principal book, being the source from which is obtained all classified information relative to the financial condition of the business. But it may be well to suggest that, although this book is the receptacle for all transactions, in whatever book the entries may originate, the ledger itself is generally ignored by courts of law. The "book of original entry," legally defined as that in which the preliminary record or entry of a transaction is first written, is accepted as authority on all questions involved in a transaction or in a series of transactions.

CAPITAL STOCK; TREASURY STOCK; WORKING CAPITAL.—The capital stock comprises the full amount of the capital authorized to be raised by the charter or articles of incorporation. The treasury stock is the stock, over and above the amount subscribed and paid for when the company is organized, which is set aside and held by the treasurer, to be sold for the purpose of securing funds to carry on operations. If the entire capital stock was subscribed and the whole amount paid in was absorbed in the purchase of the mine and the necessary equipment, and further capital is needed to carry on work, the stockholders may, by agreement among themselves, instead of increasing the capital stock, donate pro rata a certain number of shares to be held and sold by the treasurer for working capital. A working capital account is sometimes opened with a credit of a certain amount of the subscribed stock or capital, this sum being set apart for use in prosecuting the development of the mine, etc. These accounts should probably receive first attention. An examination of all entries should be made from their origin in the auxiliary books to their final posting in the general ledger. The principal books auxiliary to the general account books of a corporation are the subscription book, installment book, transfer book and stock ledger. The stock ledger is used solely for carrying accounts with stockholders of their respective holdings in the company. All the other books mentioned are books of original entry, subsidiary to the stock ledger. Examination of these books should establish the fact that the capital stock account in the general ledger is credited with the full amount of the authorized capital, whether paid up or not. If it has not been fully paid, an open subscription account will probably be found in the ledger, exhibiting the amount of stock subscribed and not paid for. The amount issued and paid in should correspond with the aggregate holdings as shown on the stock ledger. A close scrutiny of the treasury stock account, or working capital account, if either exist, should be made, to ascertain the character of the account, and how it was created. If there is treasury stock on hand, carried as an asset, the amount should be noted.

CASH RECEIPTS.—A complete audit involves a careful and systematic checking of each and every individual transaction during the period under audit. The opening and subsequent entries covering cash receipts for capital stock subscriptions paid, and for treasury stock sold, should be examined and checked. The records of sales of treasury stock should be critically examined and the entries traced to their final exhibit on the books. If stock is sold at par, "Cash" will, of course, show the proper debit entry for the amount received. If disposed of at less than par, or if sold at a premium, the entries covering the balance or difference between the amount received and the nominal or par value of the stock, as well as the cash entry, should be carefully investigated. Strictly speaking, the discount on stock sold at less than par is not a loss, nor is the premium on stock sold above par a gain, of the business proper; and the amount in either case will probably be covered into the working capital rather than the profit-and-loss account. Frequently, however, especially if a profit has been realized on such sale, the amount is carried directly into Profit and Loss. Practice varies considerably in the conduct of accounts relating to treasury stock and working capital. But in whatever manner transactions of this nature are recorded, an audit will prove its efficiency if it determines that fictitious values are not given in the accounts representing resources, actual liabilities, expenses, or any other account affecting profit and loss.

Practically, the only revenue of a mine is derived from the sale of its product, in whatever form (crude ore, concentrates, matte, bullion, etc.) it may be marketed. All items of cash, as shown on the cash book, should be checked; but this one principal item should be verified by comparing the receipts, as entered, with the ore shipment register, and with the settlement sheets or statements rendered by the smelter or other purchaser. Such a statement is rendered for each shipment separately by all ore purchasers, or, in the case of a company smelting the ores from its own mine to crude bullion or matte, by the refinery to which this product is sold.

CASH DISBURSEMENTS.—All items of cash disbursement should be checked and compared with the vouchers or proofs of payment.

If the "voucher system" is employed, and transactions are recorded by classification in a voucher journal, from which the totals of like debits and credits, instead of individual items, are posted, the work of checking and comparing the itemized expenditures will be confined to this book of first entry. The footings of this journal are then verified, and the posting of aggregate totals is regularly checked.

A critical examination of the vouchers should be made to ascertain whether the payments were properly authorized and certified.

Pay rolls should be examined to see that they are properly and duly signed by employes, and that the totals of each are correctly entered.

The balance of cash shown by the books should agree with the amount of cash on hand and in bank,

*Trans. American Institute of Mining Engineers, New York meeting, February, 1902.

less the amount of outstanding cbecks not yet presented for payment.

After the purely mechanical checking of all entries in and postings from tbe cash book, journal, etc., and the verification of their arithmetical accuracy, the next, and essentially tbe most important, stcp is to trace eacb entry from its inception to its final posting, with tbe view of detecting errors and irregularities, whether of ignorance or of intentional fraud.

This critical examination is of considerable moment, particularly if tbe audit is made under conditions exacting a close discrimination between expenditures of capital and of revenue.

(TO BE CONTINUED.)

Gas and Gasoline Engine Ignition.

By ALBERT STRITMATTER.

Premature ignition in engines may occur from the incandescence of a small nut or sharp corner in tbe cylinder, or sometbing of that kind. Witb bot tubes tbe point of ignition varies according to the atmospheric pressure, and therefore if tbe ignition takes place at a proper point to-day, it may not do so tomorrow. Furtber than this, an engine with a tube igniter may be igniting at the proper point at the factory when it is tested, but the point at which it is used may be of much higher or lower altitude and tbus cause the ignition to occur early or late owing to the different atmospberic pressure. With electric igniters premature ignition may occur from some part getting out of adjustment, or from wear on some piece.

Premature ignition, however, must not be confused witb the "lead" of the ignition. By tbis is meant what was referred to before in regard to tbe ignition taking place before the crank bas reached tbe dead center. This lead must be allowed in order to give the mechanism a chance to operate and the cbarge time to be thoroughly ignited by tbe time the crank reaches the dead center.

On tbe other hand, late ignition, while not so disastrous to the engine itself as premature ignition, is just as effective in reducing the power of the engine. The power developed by any engine depends on the compression at the instant of explosion. If the piston reaches the farthest point on tbe compression stroke and starts out on the expansion stroke before ignition takes place, the compression decreases, resulting in an equivalent decrease in power.

As a matter of fact, tbe majority of troubles with gas engine igniters are due to lack of attention, just as is tbe case with troubles with other parts of tbe engine. Of course, the more delicate the igniter is the more attention it needs. An illustration of tbis came to my attention lately. In a large dry goods store there are located two engines used for operating elevators. I had heard for some time tbat the engines were giving considerable trouble and were shut down most of the time, and that unless they soon gave different results they were likely to be tbrown back on the manufacturer's hands. Some time ago, however, the owner of the engines employed as an engineer a man who had worked some in a gas engine factory. While be had not been employed as a machinist, he had considerable knack in picking up information, and when he took charge of the engine, which was of a different make than that made in the factory where he had previously been employed, he began to study the igniter very carefully. He soon found that unless a certain adjustment was attended to carefully the engine failed to ignite. As soon as he found out what the trouble was be studied to see how tbe adjustment should be made. Since he discovered this the engines have given no trouble and have never shut down once except when he has stopped them. Here was a case such as every gas engine manufacturer meets with frequently. Two engines of a good make were giving trouble of the worst kind, and simply because the operator did not understand an adjustment tbat had to be looked after. A new engineer is placed in charge and different results are secured at once, solely because he studied the engine and located the trouble instead of tinkering with this or that part in an aimless sort of a way. Take many a gas engine operator and watch him try to start his enginc. If he fails, ask him why it did not start. Probably he will look at you with a blank expression and then say he doesn't know. What kind of success is he going to have? It is, or should he, his business to try at least to learn why an engine does not give successful results, if it does not, and then do what he can to remedy the troubles.

Tbis applies to the igniting mechanism as much as to any other part of an engine. The man who has trouble and simply sits around saying he doesn't know why the engine doesn't run, or waiting for a man to come from the factory, is sure to have trouble all the time. If he were in charge of a steam engine and boiler he would soon bave an explosion, but having charge of a machine which Providence and the designer have wisely so made as to take care of bim (instead of his taking care of it), the engine simply shuts down and the operator "doesn't know why."—American Manufacturer.

Our Chicago Manager.

Mr. George S. Scott of Cbicago is the latest business acquisition of the MINING AND SCIENTIFIC PRESS. Up to Feb. 1st, 1902, he was Chicago manager of a New York mining journal, baving acted in that capacity for tbat publication for twelve years. Mr. Scott is well and widely known, and his pleasing personality, no less tban bis intimate personal knowledge and experience, gives him pleasant acquaintance of mutual value to a multitude of business men in the section he represents.

Mr. Scott has had about fifteen years practical experience with those engaged in the mining industry —tbe manufacturers of mining machinery, etc.—and bis advice and assistance are of recognized value. He

Mr. Geo. S. Scott, Chicago Manager Mining and Scientific Press.

has handsomely fitted offices in the Monadnock Blk., Chicago, where he will he pleased to meet and welcome tbe many friends and acquaintances of the paper. Mining men are cordially invited, wben visiting Cbicago, to visit the MINING AND SCIENTIFIC PRESS headquarters, at 737 Monadnock Blk. They can have tbeir mail sent to that address.

It is worthy of note that Mr. Scott, as representative of the MINING AND SCIENTIFIC PRESS, has an unusually fine mineral collection on view in bis office. This collection, owned by our Chicago manager, comprises over 3000 specimens, among which are sixty lead minerals, making the finest collection of lead minerals in Chicago. As a matter of fact, the great Field Museum has not anything to compete with it. It has cost him about $2500. Visitors to our Chicago office will have opportunity to see one of the finest mineral collections in the country.

Mr. Scott was born in New York City thirty-six years ago. The accompanying illustration will be recognized hy many as a portrait of one of the brightest and hest liked business men of the middle West.

Quicksilver Deposits in Texas.

In the southwestern part of Brewster county and about 12 miles from the Rio Grande there are deposits of quicksilver ores, chiefly cinnahar. From east to west the district is about 8 miles in length and 3 miles from north to south, the center being in the vicinity of Terlingua postoffice.

The cinnabar is contained both in the hard Cretaceous limestone and in the more or less decomposed bluish shale that occurs in the region. Towards tbe eastern part of the district the ore is more closely associated with the shale than with the limestone, althougb even here calcite is ahundant. The shale-like streaks that are found through the unaltered limestone may bave arisen through decomposition of the limestone along planes of deposition, for it is often to be ohserved that the rich stringers of cinnahar follow these planes and occupy cracks in the limestone filled with shaly matter. Very rich pockets of cinnahar are found in the district, and but little of the mining is carried on underground. By far the greater part of the ore is taken from open cuts, and the practice is to follow the indications wherever they lead.

The development of the district is proceeding as rapidly as possihle under the circumstances. The distance from the Southern Pacific Railway at Alpine is ahout 90 miles, from Marathon 85 miles and from Marfa about 100 miles, most of the freight and hauling going over the road from Marfa. In 1900 tbe production was 1750 flasks of quicksilver, and in 1901 ahout 3400 flasks, a flask holding about seventy-six pounds of the metal.

Practically all of tbe output to tbe end of 1901 is to he credited to the Marfa & Mariposa M. Co. Parker & McKinney produced some metal in a small furnace on tbeir claims near the eastern houndary of the district. The Marfa & Mariposa M. Co. has been operating a ten-ton furnace, and is now huilding a second ten-ton furnace alongside of the old one. The Terlingua M. Co. (Lindheim & Dewees) has recently built a forty-five-ton furnace, which can be urged up to fifty tons. Thesc furnaces are all of good construction, and some of tbe brick for them are made within a few miles, tbe firebrick being hrought in from St. Louis. Both wood and water are scarce. At the present time most of tbe water is being hauled from the Rio Grande, a distance of about 12 miles.—Texas Mineral Survey Bulletin No. 2.

Moose Creek Placers.

Written for the MINING AND SCIENTIFIC PRESS.

This property, situated in the Newsome district in Idabo county, Idaho, is a good example of a placer property with a long life. Every season since 1862, and by all metbods from rocking to hydraulicking, it has heen in operation, and there is known grouud in sight at the present seasonal ground breaking rate for twenty-five to thirty years' operations yet.

Tbe property has been througb many hands, white and Chinese. Tbe latter, while mining up the side gulches, first opened—if they did not discover—the "Old Channel" ground, lying on the ridges and paralleling tbe present South Fork of tbe Clearwater, which lies some 800 feet helow. They mined upwards of 1,500,000 yards of gravel. Tbe property was jumped hy white men and eventually came into the hands of the present owner.

Tbere are at present 22 miles of ditch appurtenant to the property, tbe principal one, 12 miles long, 36 inches wide on the bottom and 20 inches deep, mostly on a grade of $\frac{3}{8}$ inch to the rod, carrying 900 cuhic feet of water per minute. With 30-inch flume, 24 inches deep, on 6½ incb grade per 12 feet, and one No. 2 giant witb 4-inch nozzle, under 160 feet pressure, working on a bank 120 feet deep, about 1500 cubic yards of gravel per day is washed.

The Western, or No. 3, gravel deposit at present being worked is 1100 feet long, so far as sbown by the present workings, of a deptb of 185 feet under the top of tbe ridge, and widtb of 550 feet. Neither the width nor depth of the deposit has been determined yet. Sbafts sunk to determine the width, sbowing "hedrock" at 8 feet depth and ergo the north rim, have since been mined out, sbowing 75 feet of gravel under the alleged bedrock and no sign of the true hedrock as yet. One season's work only has been done as yet on this deposit and the extent and direction, beyond the dimensions given, are somewhat bazy.

The formation beneatb the deposits on this property has all been extensively faulted since the gravel was deposited, the fault lines running to the grass roots and the strata of sand and gravel showing beautifully the depth of the throw. The existence of tbese faults nullifies the prohable value of sinking shafts to bedrock to determine the level of the bottom of tbe channel. Nine shafts were put in the middle or No. 2 deposit and it was imagined the level of the channel hottom and even its grade had been determined. Suhsequent mining sbowed 14 feet of gravel helow the level of tbe bottom of the lowest shaft. The bedrock flume, put in from the shaft data through 400 feet of rock work, failed to hottom hy about 6 incbes in depth an area not more than 8x40 feet, as tbe deep place cbanced to he toward the lower end of flume. That is what might he called bull-headed luck. The location of this depression 300 feet fartber up the flume line would bave left tbe flume 12 feet in tbe air.

As a result of this experience, having on the west deposit 800 feet vertical available for dump, the sluices have been put in: the upper line 215 feet helow the level of the top of the deposit, the lower 315 feet helow, and mining commenced. If the mining develops the fact that the deposit goes helow the upper flume it will be pulled out. This seems haphazard work, hut was deemed advisable under the circumstances.

The gravel is largely decomposed, hreaks readily under the stream and carries comparatively few boulders, ahout 100 pounds of No. 2 powder being used per month for "bulldozing" houlders, practically no houlders being drilled, and none left on hedrock. The gold is mostly fine, less than 1% running the size of a grain of wheat. Last year's (1901) shipments graded 925 fine. The pay is seemingly distrihuted throughout the whole of the depth of the hanks in more or less erratic pay streaks and hunches. In places tbe deposition of gold is heavier on the bedrock, in other portions of the channel the bedrock is as lean as any portion of the upper banks.

A Problem of Economy.

By W. H. WAKEMAN.

The following problem was presented to the engineer of a new mill, with a request to solve the same, and as it involves the consideration of several matters that should interest steam engineers, it is presented here for the benefit of those seeking information along these lines. Two engines were presented as candidates for supplying power to run the machinery, and the owners wanted to know which would be the most economical when all things were considered. They will be designated as No. 1 and No. 2, the dimensions of which are as follows:

No. 1—Cylinder 14x42 inches; speed 100 revolutions per minute; boiler pressure 100 pounds with cut-off at ¼-stroke.

No. 2—Cylinder 16x36 inches; speed 80 revolutions per minute; boiler pressure 110 pounds, with cut-off long enough to develop the same power as No. 1 under given conditions. Which will take the least steam? The first point is to determine the power developed by No. 1. The area of piston is 154 square inches. The mean effective pressure possible to realize is determined by the following formula:

$$\frac{1 + \text{Log} \times P}{R} - B = \text{M. E. P.},$$

in which Log = hyperbolic logarithm of the expansion rate, P = the absolute initial pressure, R = the ratio of expansion, or the expansion rate, B = the absolute back pressure, and M. E. P. = mean effective pressure.

As the cut-off takes place at ¼-stroke the expansion rate is 4, the hyperbolic logarithm of which is 1.3863. The initial pressure is taken at 100 pounds by the gauge, as it will be less than boiler pressure, making it 115 pounds absolute. The back pressure will be taken at 17 pounds absolute. Substituting for the figures their values and solving the problem results as follows:

$$\frac{1 + 1.3863 \times 115}{4} - 17 = 51.6 \text{ mean effective pressure.}$$

The piston speed is $(42 \div 12) \times 2 \times 100 = 700$ feet per minute, and the power developed is:

$$\frac{154 \times 51.6 \times 700}{33{,}000} = 168.5 \text{ H. P.}$$

For comparison, it is necessary to determine the volume of steam used to develop power in both cases, when the following formula may be applied:

$$\frac{A \times P \times S}{1{,}728} = F,$$

in which A = area of piston in square inches, P = length of stroke to point of cut-off in inches, S = number of strokes per minute, and F = cubic feet required per minute. Applying this to the case of No. 1 results as follows:

$$\frac{154 \times 10.5 \times 2 \times 100}{1{,}728} = 187 \text{ cubic feet per minute.}$$

Turning our attention to No. 2 we find that the area of piston is 201 square inches, and the piston speed $(36 \div 12) \times 2 \times 80 = 480$ feet per minute. It must develop 168.5 H. P., which gives all the required factors except the mean effective pressure. To obtain this the following formula may be used:

$$\frac{\text{H. P.} \times 33{,}000}{A \times S} = \text{M. E. P.},$$

in which H. P. = the H. P. developed, A = area of piston, S = speed of piston in feet per minute, and M. E. P. = mean effective pressure. Applying this formula to the case in hand, results as follows:

$$\frac{168.5 \times 33{,}000}{201 \times 480} = 57.6 \text{ pounds mean effective pressure.}$$

The next step is to determine the point of cut-off that will give 57.6 pounds mean effective pressure under stated conditions. Casual observation will present the idea that by taking the formula given for the purpose of finding the mean effective pressure, and changing it slightly, with the mean effective, initial and back pressure given, it will be possible to form one by which the point of cut-off will be determined, but this is not practical because there are two factors missing, namely the ratio of expansion and the hyperbolic logarithm of the same, therefore it becomes necessary to assume a ratio of expansion, applying the mean effective pressure and note the result. If it is too high, then take a shorter point of cut-off, and solve the problem on this basis. If too low take a longer point of cut-off and try again. If we claim that the mean effective pressure on a non-condensing engine working under fair conditions and cutting off at ¼-stroke is one-half of the boiler pressure by the gauge, it will be nearly correct, as illustrated by the foregoing case, where the boiler pressure is 100 pounds and the mean effective pressure 51.6 pounds on the 14x42-inch engine. Following out this suggestion, we see that in order to secure 57.6 pounds under the same conditions our point of cut-off must be a trifle longer than ¼-stroke, so we will assume it to take place at $\frac{9}{32}$-stroke, or putting it in decimal form, at .28125-stroke.

The rule for determining the ratio of expansion, when all dimensions are in inches, is to divide the stroke by the distance traveled by the piston at the point of cut-off, but in this case it is stated in fractions of the stroke, therefore it becomes necessary to divide 1 by the given fraction.

$1 \div .28125 = 3.55$, the hyperbolic logarithm of which is 1.2669. Again applying the formula for determining the mean effective pressure results as follows:

$$\frac{1 + 1.2669 \times 115}{3.55} - 17 = 56.43 \text{ pounds.}$$

This is 1.17 pounds less than is required, but when we take the cut-off at $\frac{5}{16}$-stroke, it is three pounds more than is wanted, therefore the former is nearer right, and near enough for all practical purposes.

This demonstrates that the 16-inch engine will cut off at $\frac{9}{32}$-stroke to be equal to the 14-inch cutting off at ¼-stroke.

As we wish to know how many cubic feet of steam per minute this calls for, it is necessary to multiply the stroke by the point of cut-off, and $36 \times .28125 = 10.125$ inches.

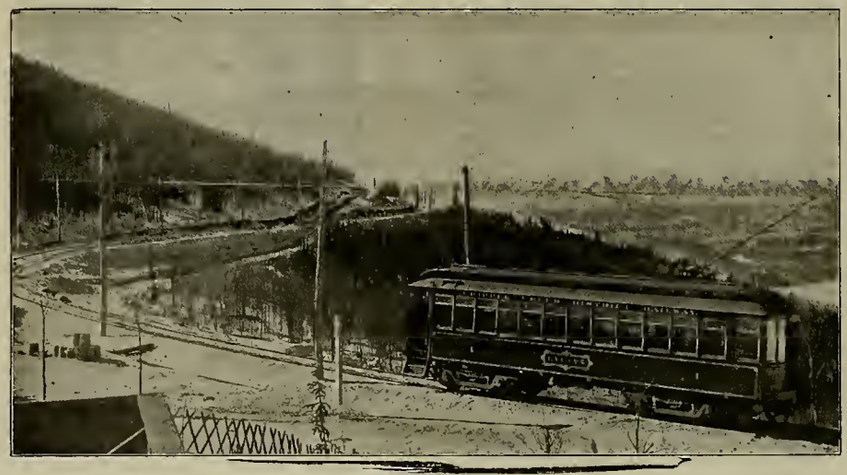
The capacity of this cylinder under these is determined as follows:

$$\frac{201 \times 10.125 \times 2 \times 80}{1{,}728} = 188 \text{ cubic feet per minute.}$$

The above demonstrates that both engines use practically the same quantity of steam in a given time, therefore if one is any better than the other, it is due to other causes.—Electricity.

Cripple Creek, Colorado.

With this appear two new views of Cripple Creek, Colo., railways. The view with the electric car so



prominent is from "Midway" station on Bull Hill, 10,514 feet above sea level, looking southwest to the Arkansas River valley, with the Sangre de Christo mountain range in the distance.

TELPHERAGE is the "transmission of vehicles by electricity to a distance independent of control from the vehicle." The word is derived from the Greek words meaning far-carrying, the first syllable being of the same derivation as that in telegraph and telephone. Aerial telpher lines may be of either cable or rail construction, the former being far more common, and the latter, on account of its high cost, being confined to relatively short lines where heavy loads and special conditions warrant its use. The electrically driven carrier which runs upon the cable is called a telpher, and is of the simplest construction. There is no gearing, the grooved wheel which runs upon the cable being fixed directly upon the motor shaft, which is made large in diameter and runs in amply proportioned bearings adjacent to the wheel, to sustain the total weight of the motor and load.

Mathematics and Engineering Literature.

The notation of mathematics was invented as a sort of shorthand assistance to thought. Its present use seems very largely to be definable by Talleyrand's famous description of language—a means for concealing thought.

It has come to be the fashion, in papers presented before engineering societies and written for the technical press, to use a complicated and incomprehensible variety of mathematical symbols, often for the expression of the simplest statements. Now, it is an axiom that nothing ever was under any circumstances expressible in a mathematical formula that could not as well, if not as briefly, be expressed in the English or any other reasonable language. And further than this, some of the very greatest work in engineering literature and in the expression of science has been done in language which is comprehensible to any person of ordinary intelligence.

If we go back and look at the work of the fathers, of those who laid the foundations of modern engineering and science, we find that in most cases they clothed the thoughts which they wished to present in language so simple that often to-day it stands as an example of clearness of expression. The work of Faraday was probably as far-reaching, as comprehensive and as fundamental as had ever been done; yet his writings are models of simple diction and clear statement. Tyndall did more for science in the English speaking world than almost any one man of his generation by translating the mathematical labors of his contemporaries into good, plain English. This is not to be thought of as in any way a reflection upon the great importance and immense value of mathematical demonstration and expression, but the fact remains, nevertheless, that with very few exceptions demonstrations, difficult and abstruse when expressed in the formulæ and symbols of mathematics, become clear, evident and satisfactory when written in intelligent language. And they reach a far wider audience—they are more convincing, they go further.

It is betraying no secret to state the fact that a paper before an engineering society, or an article in a technical journal, commands a kind of reverent re-

spect from the uninitiate when it bristles with equations and integral signs; but such papers are listened to by the few and read only by those whose immediate interest tends in their direction.

Take the same subject and the same treatment, put it in plain English, illustrate it with meaning diagrams, and note the difference.—Electrical Review.

Mining as a Profession.

Written for the MINING AND SCIENTIFIC PRESS by J. B. BALCOMB.

Every young man who arrives at the years of maturity confronts the question as to what to do for a living. To a young man of limited means or opportunities a mistake means more than to others, for he has less chance of retrieving his loss. Some men are fitted to toil almost altogether with the brain, others do better at an almost purely physical employment, but the vast majority never succeed well except when engaged in an occupation requiring the use of both hand and brain.

It is with this latter class in view that we suggest mining as a profession. Mining was formerly supposed to be almost entirely a matter of hand training. Of late, unfortunately, some schools and universities have swung to the other extreme and teach it as though it were a matter of brain culture susceptible of being taught from books, with an occasional field exercise or visit to a mill or smelter. Both ideas are equally erroneous and lead to like results, although in entirely different directions.

The bookman is wedded to his books and the miner to his pick and shovel. Fortunately, there has arisen a class of mining engineers and mine owners who realize that somewhere there lies a golden mean. This has given an impetus to practical training and is the only kind of an education that has any market value in the mining world.

That mining as a profession is one of the best paying and most useful is well recognized here on the Pacific coast. With the establishment of schools of higher learning came men well versed in scientific researches and able to predict to a nicety the exact metallurgical result to be expected under ideal conditions. Their students were taught precise methods and exact determinations. But the mining world promptly repudiated them because, while they know enough, they could practically do nothing in the way to which miners were accustomed or in any way to achieve commercial success. And so the belief took possession of miners that an education was a detriment to a man in mining. Yet the failure of self-made men to adapt their processes to new ores, and the large per cent of values always found in the tailings, kept forcing home the conviction that there was still something lacking.

This lack is largely to be found in the system of education adopted. Schools teaching young men actually to carry on the processes of mining and milling, and at the same time teaching sufficient of the underlying reasons and principles to enable them to adapt their knowledge to different mines and conditions, are finding favor everywhere with the mining profession. It is to such schools as these that young men should turn when considering mining in the light of a profession for life. Attend some school which is devoting its efforts exclusively to this line or work and has courses that are thorough and practical from the ground up. The advantage of such an education to young men wishing to prepare for this profession can not be overestimated. It gives them exactly what they need to go into mines and work understandingly.

As in other professions, a large part of the best practical experience has been embodied in the form of books and is being continually augmented by the current mining and technical journals. A man must not consider his education finished when he has completed the course in some school or college, but must make use of these hooks and periodicals in order that he may keep posted on what others are doing and be able to push himself to the front.

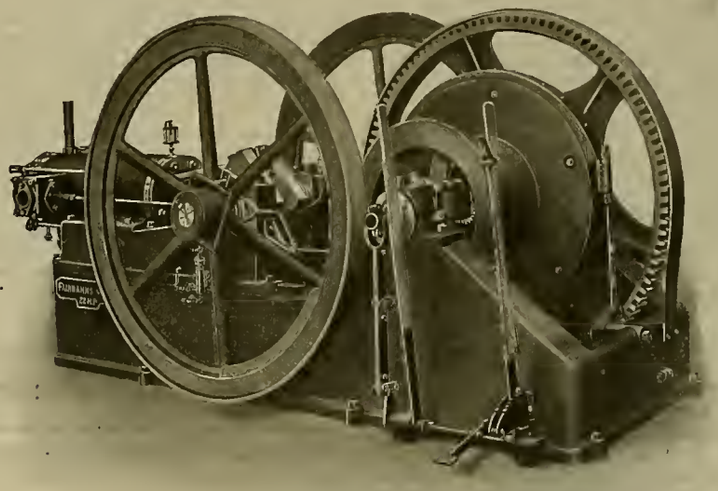
There is no question but what mining as a profession pays better in health and in dollars and cents than any other profession. To succeed in it requires the same devotion to study, the same close attention both to underlying principles and to details of operation, and the same untiring energy and determination, to succeed as in other professions. An occupation that pays ordinary laborers from $2 00 to $3.00 a day cannot but pay its professional men good salaries. This is just what mining does. The reason for this is found in the fact that an incapable man can cause a company to lose large profits, and in many cases actually to sink a fortune without making a cent. There are hut very few lines in which individual judgment and educated common sense go so nearly to making the whole difference between success and failure. Like every other business, a man cannot expect a $10,000 salary from the start, hut he can expect a good margin above expenses and rapid advancement, hoth in salary in position, if he will hut qualify himself to succeed in responsible places. Do not be satisfied with what you have, or what you are, if you are capable of something better. Fit yourself to succeed, and then be satisfied with nothing less.

The probability of receiving a high salary is much more true in metal than in coal mining. It is also true that there is much more room for individual effort to be recognized and rewarded in the great West than in the overcrowded East. Progress in milling processes is nowhere so rapid as in the mining camps of the Rocky mountains and on the Pacific coast, and hence these offer the greatest opportunities for hard work and careful attention to be recognized and rewarded.

In whatever branch of mining you qualify yourself, and whatever State or region you choose as your field of labor, remember that success is achieved only by careful preparation and through unremitting toil and endeavor.

New Gasoline Hoist.

Herewith is illustrated the gasoline geared hoist, manufactured by Fairbanks, Morse & Co. of Chicago, Ill., which machine is receiving attention in mining



operations, particularly where fuel and water are scarce. The manufacturers state that a large number of machines of this type were installed last year. The sizes range from 6 H. P. to 44 H. P., inclusive. The special advantage in using a gasoline hoist is that it entirely dispenses with the difficulty often experienced at mines in delivering solid fuel for a steam boiler. There is little water required, and in cases where the water is bad and impregnated with alkali and kindred chemical impurities that necessitate repair and expense in connection with the tube and boiler shell, that expense is dispensed with.

The saving in cost, as compared with steam, is great, but it is difficult to give an exact comparison, as the comparative cost of fuels differ in different sections. A statement made in a recent letter received from a user of one of these machines covers the economy, as compared with steam, as follows: "The cost of operating the gasoline hoist is less than the water used for a 6x8-inch double steam hoist which did the same work that the gasoline hoist is now performing." Others have hoists of an average of 25 H. P., and these have been operated ten hours on 2½ gallons of low-grade gasoline. When a shaft is being sunk at the end of a tunnel, these hoists are found convenient, as the hoist can be set in the tunnel and operate direct into the shaft; while in the case of steam it would he necessary to locate the boiler outside of the tunnel and convey the steam back into the tunnel to the point where it was to be used for hoisting.

These machines are ready to start at a moment's notice and give out power at once. These engines have a patent self-starting device, which enables one man to start any sized hoist with perfect ease. The general construction of this hoist is simple and strong.

Mines Near Clifton, Arizona.

[STAFF CORRESPONDENCE.]

The New England Copper Co., of which A. P. Ayling is manager, is developing the old King group, located 5 miles north of Clifton, near the top of the range, overlooking the San Francisco river. This property produced considerable high-grade ore about twelve years ago, which was smelted at a furnace on the river. The company's present holdings cover about 3000 feet along an ore belt that strikes from northeast to southwest. This belt is within a porphyry dike which cuts through a granite country rock. Development shows the ore body to be from 50 to 100 feet wide, varied by intrusions of the porphyry. Development consists of considerable open-cut work, three different shafts, each about 100 feet deep, and a 700-foot tunnel. The most of this work is in ore, which in the main is copper glance, with some red oxides and carbonates. Much of the glance runs over 70% copper. The material hoisted in sinking a 130-foot shaft ran 20% copper. Manager Ayling states that the ore now on the dumps is worth $200,000. Gasoline engines are used in hoisting. Water is now carried on hurros up a steep trail from the river to the mine, making an ascent of about 2000 feet. Development will be carried on extensively and future plans contemplate the erection of a tramway line from the mine to the river and the building of a smelting plant at the latter place.

The Clifton Con. copper mines, L. A. Dunham manager, comprise holdings on both sides of the New England group, covering extensions of the same belt. The principal operations of this property are on the northern slope of the mountain, extending nearly to the river. The feature of Mr. Dunham's work is the driving of a deep tunnel, which strikes southwesterly, along the course of the ore belt, through his own group and that of the New England Co., cutting 1200 feet below the apex of the mountain and about 1000 feet below Mr. Ayling's workings. This tunnel is in about 800 feet and is double-tracked. Durkee electric drills are being used. A number of tunnel drifts are being run on the vein at various points above the main tunnel. This property comprises fifty claims. On the north end of the group the ores are copper glance and a good deal of gold.

On the east side of the San Francisco river is a gold belt, the ores there carrying free gold and sulphides. Dell M. Potter has considerable holdings there which he is developing by a crosscut tunnel. A singular thing here is that this tunnel has run into an intensely heated section of syenite rock at 200 feet from the entrance. The heat is too great to permit the continuance of the work. WASCOTT.

Clifton, Ariz., Feh. 18.

The Henry Train Lighting System.

Written for the MINING AND SCIENTIFIC PRESS by C. F. ELLIGTT.

By this system the running of the train is made to develop the electric current for the lights. A generator is mounted on a bushing, the outer fields and casing being journaled on the ends of the hushing. The hushing is then mounted on the axle by removing one of the wheels from the axle, the wheel being then pressed on again. This entire operation can be accomplished in less than an hour in any well equipped railroad shop. After the bushing is placed over the axle, two rubber plugs, reinforced by a steel shell, are forced between the hushing and the axle, binding the hushing to the axle, forming an elastic connection between the two. This method of connecting absolutely eliminates any serious vibration from the rail joints, being transferred to the delicate part of the generator.

With the adoption of the direct-connected generator, belts or gears are avoided, and with them all difficulties of alignment.

The form of generator employed is an eight-pole machine, four poles being to the right, the other four to the left. There are two separate armatures, having between them a single commutator. With this method of construction, the necessary efficiency is secured at slow speed. The output of this generator at 15 miles an hour is 52 volts and 40 amperes, the revolutions being about 2000 per minute; the weight, including bushing, plugs and generator, is under 700 pounds.

As railroad coaches are not always run in the same direction, a device to reverse the direction of the current automatically is provided. The two brush-

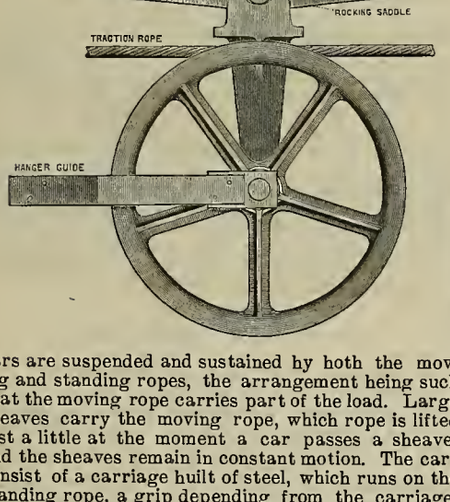
holder rings are run in grooves on the inner surface of the field casing. When the generator is revolving in one direction, the brushes are brought over to a point on the surface of the commutator, from which the greater current is taken; when the direction of rotation is reversed, the brushes are allowed to move over until the positive brush still takes the positive current from the commutator; the brush rings are then held in this position. The entire operation is automatic and certain of results. The neutral points on the commutator being located, stops are placed opposite them, which stop the brush from passing the point.

One switch is employed to perform all of the operations. This is a double solenoid carbon brake switch, which throws the entire device in operation when the line voltage reaches 52. The following operations are performed by this one switch: When the speed of the generator is not sufficient to produce 52 volts, the switch is inactive, but in its inaction it places out of circuit the entire generator and regulating devices. The moment the voltage of the line reaches 52, the switch is thrown over with a positive interlocking motion. The immediate result of the acting of the switch is that a circuit is made through the motors of the regulator, which is instantly placed in operation and maintains a uniform voltage, no matter if the speed of the train reaches 100 miles per hour. Simultaneous with this regulator being placed in operation, the lamps and other devices which were being fed by a storage battery are thrown out of the battery circuit and placed in the main circuit of the generator; the surplus current, however, which is not used by these different devices, is fed into the battery for future use, when the speed of the train is not sufficient to generate the necessary current or when the train is standing still.

The weight of the equipment for a car, including generator and batteries, is under 1500 pounds. The system is intended to be supplied to each car; but a generator can be built which will supply the whole train. Each car has a separate set of batteries, which are charged when the train is in motion, and when disconnected or standing still the lights will still continue to burn.

The Dusedau Wire Rope Tramway.

Herewith are illustrated some features of the Dusedau system of wire ropeways, manufactured by the Broderick & Bascom Rope Co., St. Louis, Mo. The



cars are suspended and sustained by both the moving and standing ropes, the arrangement being such that the moving rope carries part of the load. Large sheaves carry the moving rope, which rope is lifted just a little at the moment a car passes a sheave, and the sheaves remain in constant motion. The cars consist of a carriage built of steel, which runs on the standing rope, a grip depending from the carriage, and a frame or hanger attached to the grip carrying the bucket. The grip holds the moving rope by friction and works automatically. The grip is attached to the moving rope by an inclined plate in the path of the attaching rollers. It is detached from the rope by another inclined plate striking the rollers on the opposite side. There are no objections to intermediate main stations, as the cars pass from one section of the line to the other without handling. The vertical position of the car is not affected by the moving rope. The grip is free to turn in its bearing. While passing a tower the car is guided by a hanger guide. A tramway of this make, 12,500 feet long, was recently completed on the Contention mine, near Silverton, Colo.

Must Explore on the Veins.

Judge Gilbert of the U. S. Circuit Court at San Francisce, Cal., in a decision in the case of the St. Louis M. & M. Co. of Montana, and W. Magger, appellants, vs. the Montana M. Co., Ltd., the case being on appeal from the U. S. District Court of Montana, says:

Plaintiff is owner of the St. Louis lode mining claim and the Montana M. Co., Ltd., is the owner of the Nine Hour lode mining claim. Appellants were proceeding to drift a tunnel 260 feet underground horizontally from the St. Louis claim eastward and into the Nine Hour claim for the purpose of reaching the mining lode which had its apex in the St. Louis claim and which they had a right to pursue in its downward course as it passed from its dip to the eastward within their side lines into the Nine Hour claim. It was stipulated that the tunnel, if projected in the course in which it was being drifted, would reach a vein or lode which had its apex within the St. Louis claim, and that in the course of its progress there would be encountered no other vein, lode or ledge. The appellants were enjoined from proceeding with the work.

The case involves the interesting question whether the owner of a mining claim, who has a right to pursue beyond the side lines of his claim a vein or lode which has its apex within his own claim, is confined in his route of exploration within or upon the vein itself and is without authority to otherwise enter an adjoining claim. There is no warrant for saying that they have any general right of exploration within land on an adjoining patented claim whether upon or below the surface. The right of exploration is given for the purpose of making discovery of mineral. Of what avail would the right of exploration be if no benefit could be obtained from discovery made thereby? The ground covered by a subsisting valid mineral location is open to exploration only by the owner thereof. The statute gives the appellants the right to follow the vein which they were seeking to reach by the tunnel, but it confers upon them no right to approach it from any point other than the vein or lode itself.

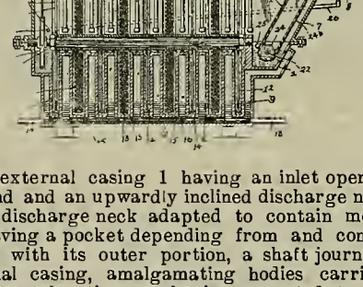
A patent when issued is a grant of land with all of the rights incident to common law ownership. In addition to the land there is the right to pursue such veins, lodes and ledges extralaterally in case they depart from the perpendicular and extend beyond the side lines of the claim. The decree of the court below is affirmed.

Mining and Metallurgical Patents.

Patents Issued March 4, 1902.

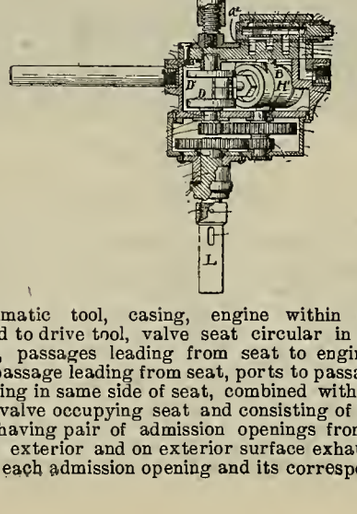
Specially Prepared for the MINING AND SCIENTIFIC PRESS.

AMALGAMATING MACHINE.—No. 694,112; G. C. Scott, Columbus, Ohio.



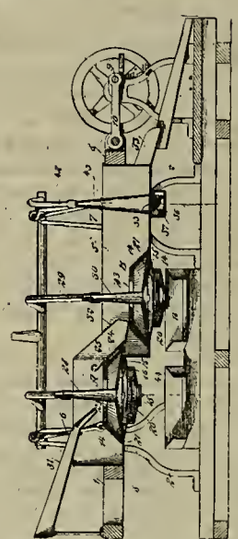
An external casing 1 having an inlet opening at one end and an upwardly inclined discharge neck at other, discharge neck adapted to contain mercury and having a pocket depending from and communicating with its outer portion, a shaft journaled in external casing, amalgamating bodies carried on shaft, an elevating mechanism mounted to run in discharge neck and carrying mercury cups and amalgamating plates, cups and amalgamator plates adapted to run in a body of mercury contained in lower portion of discharge neck and in lower portion of external casing and a pipe connection between mercury pocket 8 and opposite end of external casing.

PNEUMATIC DRILL. — No. 694,714; T. Barrow, Cleveland, Ohio.



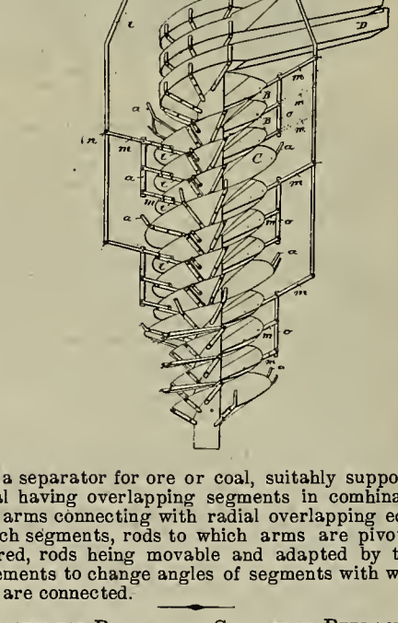
Pneumatic tool, casing, engine within casing adapted to drive tool, valve seat circular in cross-section, passages leading from seat to engine, exhaust passage leading from seat, ports to passages in seat being in same side of seat, combined with oscillating valve occupying seat and consisting of hollow barrel having pair of admission openings from interior to exterior and on exterior surface exhaust recesses, each admission opening and its corresponding exhaust recess being oppositely arranged longitudinally of valve from other admission opening and recess, there being opening for admission of operating fluid to interior of valve.

GOLD SEPARATOR.—No. 694,255; A. L. Dana, Colorado Springs, Colo.



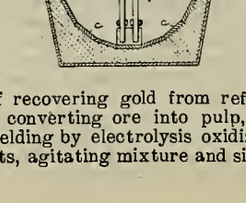
A pan, a trap arranged therein, comprising an upwardly and inwardly tapered hood having an inwardly and downwardly extended flange at its upper edge, a dished ring plate on which hood is supported, a tray attached to under side of ring plate and having a valve controlled opening in its bottom, a dished perforated disk supported in tray, an upwardly and inwardly inclined spreader plate having spaced legs resting on ring plate, and a water supply pipe leading through spreader plate.

SEPARATOR FOR ORE OR COAL.—No. 694,420; J. N. Rice, Scranton, Pa.



In a separator for ore or coal, suitably supported spiral having overlapping segments in combination with arms connecting with radial overlapping edges of such segments, rods to which arms are pivotally secured, rods being movable and adapted by their movements to change angles of segments with which they are connected.

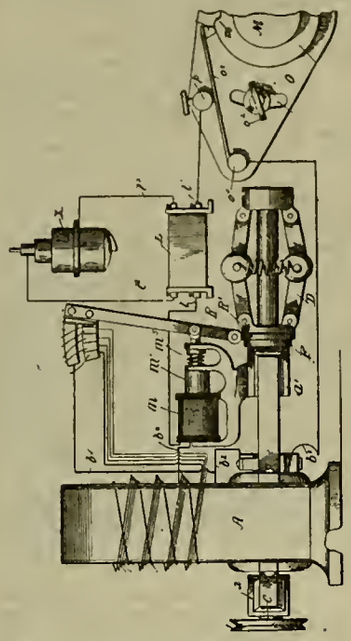
PROCESS FOR RECOVERING GOLD FROM REFRACTORY ORES.—No. 694,349; H. R. Cassel, New York, N. Y.



Process of recovering gold from refractory ores consisting in converting ore into pulp, adding salt capable of yielding by electrolysis oxidizing and dissolving agents, agitating mixture and simultaneously

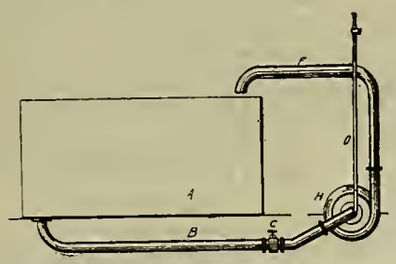
electrolyzing it under such conditions as to oxidize refractory elements, dissolve gold and reprecipitate it in form of black powder, finally adding solvent to redissolve such black powder.

ELECTRIC IGNITING APPARATUS FOR EXPLOSIVE ENGINES.—No. 694,409; S. F. Neill, Bradford, Pa.



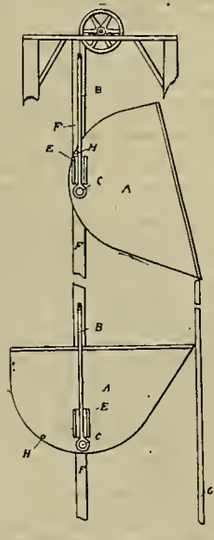
In an explosive engine, combination with igniting device, of electric generator therefor provided with coils for increasing normal magnetism of field magnets and series of demagnetizing coils of different resistances, circuit controller connected with coils and governor operated by speed of engine, operatively connected with circuit controller.

CYANIDE PROCESS OF EXTRACTING PRECIOUS METALS FROM ORES.—No. 694,521; B. W. Begeer, Florence, Colo.



Process of treating material containing the precious metals, consisting in setting in motion in an endless path solution of cyanide of potassium, introducing oxygen to moving liquid, and finally subjecting metal hearing material to action of solution.

SELF-DUMPING HOIST.—No. 694,579; E. L. Ransome, New York, N. Y.

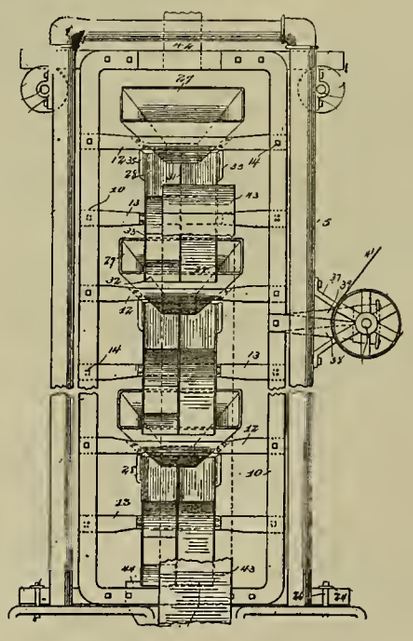


A hoisting tub swung on hail wherein it overturns by its own weight, in combination with fixed guides upon which hail moves, stop to prevent tuh from overturning too far, and guide rail in front of tuh which retains tub in position and upon top of which tuh tips, the hoisting tuh A swung in bail B in combination with fixed guides F and guide bar G.

ORE CONCENTRATOR.—No. 694,444; W. Thurmond, Hillsboro, New Mex.

An ore concentrator provided with draft chamher, inclined reciprocating screen therein, suction box into which opens draft chamber to create draft therein, and to permit coarser material to pass from screen of draft chamber into suction box, two hoppers arranged within suction hox one alongside the other, one heing directly below discharge end of screen, this hopper receiving coarser ore, the other the tailings, and an elevator for receiving coarser ore from hopper.

ORE SAMPLER.—No. 694,734; C. R. Foster, Blue Island, and W. Coolidge, Chicago, Ill.

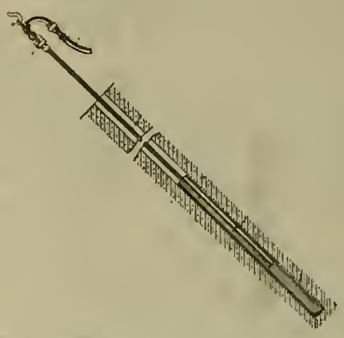


An ore sampling machine, comprising in combination upright supporting frame, pair of vertical frames mounted side hy side so as to he capable of lateral reciprocation within supporting frame, series of hoppers and dividers fixedly secured in vertical frames respectively so disposed as to present series of alternate hoppers and dividers, discharge chute disposed in front of series of hoppers and dividers having those portions of its rear wall opposite lower ends of discharge chambers of dividers cut away to receive discharge therefrom, and means for imparting to vertical frame simultaneous lateral reciprocations in opposite directions.

REFINING COMPOSITE METALS.—No. 694,699; T. Ulke, Sault Ste. Marie, Canada.

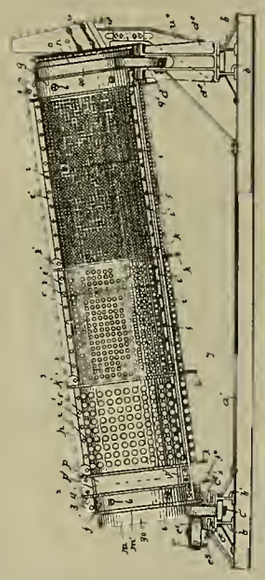
The process of refining nickelliferous-copper material consisting in electrolytically depositing copper from acid solution of such material with anode of same material; periodically withdrawing portion of electrolyte as it becomes poorer in copper and richer in nickel, separating copper and nickel salts contained in withdrawn electrolyte; electrolytically depositing nickel from non-acid bath of nickel salt by use of insoluhle anode; periodically withdrawing and concentrating portions of impoverishing nickel bath, and periodically restoring to copper and nickel baths, respectively, copper and nickel salts obtained from withdrawn solutions.

PROCESS OF BORING HOLES IN ROCK, ETC. — No. 694,534; F. H. Davis, New York, N. Y., assignor to Davis Calyx Drill Co., New York.



Process of boring holes in rock, or similar material in the earth's strata, consisting in milling or grinding same with free or loose material, introducing water under pressure into hole to carry up millings or grindings, and, after hole has reached a predetermined depth, maintaining substantially uniform pressure upon water at bottom of hole, regardless of depth of latter, to carry millings or grindings portion of the way only to surface of the hole without carrying milling or grinding material therewith, and catching millings or grindings at point intermediate bottom and top of hole.

REVOLVING SCREEN.—No. 694,565; V. W. Mason, Jr., New York, N. Y., assignor to Taylor Iron & Steel Co., Highhridge, N. J.



In revolving screen, an inclined revoluble cylinder consisting of frame comprising end rings f, g, secured together by longitudinal bars h, sectional screen plates secured to hars h, to present perforated divisions, end ring m fitted into ring f of frame, secured thereto hy holts and having circumferential flange m′ abutting against end of ring f, also having roller-receiving surface 30, and roller-receiving surface 50, pair of cylinder supporting rolls engaging roller-receiving surface 30, and roll engaging roller-receiving surface 50 turning on vertical axis in alinement with perpendicular radius of cylinder, which receives end thrust of cylinder.

ACCORDING to Prof. J. B. Harrison, the Government Geologist at Georgetown, diamonds have been found in three districts of British Guiana—in the north on the upper waters of the Barima river, on the Barima river ahout Ianna, some 60 miles to the southeast, and in the Upper Mazaruni hasin, in a district which, so far as geological indications go, may extend over the tract of country between the headwaters of the Mazaruni and Puruni rivers, though up to now all discoveries have been made ahout the hasin of the Putareng river. There is also the Omai district on the Potaro, a tributary of the Essequibo river, which lies in a southerly direction from Georgetown. This wide diffusion of the gem shows that the chances of enlarging the area in which it may be mined are favorahle. The diggings at present are confined to the Putareng and Potaro districts. There are a dozen companies either mining or prospecting in the first named district and others are heing formed.

MINING SUMMARY.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

G. Kyrage and J. Dumas, of Juneau, have sold the Greek Boys group on Berners bay, near Juneau, to an Eastern company represented by E. S. Sutherland.

The February 15th report of the Alaska-Treadwell M. Co. shows for the preceding thirty days 35,667 tons of ore crushed, valued at $36,279, and saved 815 tons of sulphurets, of the value of $32,267. Gross yield for the month was $78,617, the ore averaging $2.20. The working expenses were $61,138.

KETCHIKAN.

The exploration tunnel, at the Ketchikan G. Co.'s property at Sealevel, Thorne Arm, has been driven across the ledge formation and discloses, in addition to the 18 inches of gold bearing quartz on the footwall, 10 feet of quartz porphyry and 10 inches of quartz on the hanging wall, all well mineralized and carrying good values. The quartz porphyry assays up to $8 per ton, and the quartz on the footwall side assays between $13 and $14 per ton.

KUYUKUK.

Hammond river, Kuyukuk, is reported to be the center of attraction in this district. Hammond river was discovered late last fall. It has been staked for a distance of 40 miles. None of the claims have been prospected except the discovery claim, owned by Sullivan & Jacoby. The pay streak is from 1 to 4 feet to bedrock and is 200 feet wide. According to a letter written by V. V. Lowry, who has been in that section two years, the owners of the claim take out five or six buckets of frozen gravel per day, which they take to their cabin. At night they thaw it and realize from $75 to $125. Other claims on the river are thought to be equally as rich. The winter diggings on the Kuyukuk are turning out well. Claims Nos. 6 and 9 are yielding from 17 cents to $1.25 to the pan.

ARIZONA.

COCHISE COUNTY.

At the foot of the Chiricahua range, a discovery of placer gold has been made within the past few weeks. The gold bearing gravel extends along the foothills a distance of 5 miles, and down towards Sulphur Springs valley for 3 miles. The gold is coarse, well washed placer gold, of high grade, running over $18 per ounce at the mint. But little work has been done. In one place a small trench of about 50 feet in length, 2 feet wide and 18 inches deep, has been run in a small gulch, and from it nearly $1000 of gold, it is claimed, has been taken out by panning. The hills surrounding the gulches all prospect.

The Roosevelt G. & C. M. Co. has been incorporated at Bisbee for the developing of some mining property on the White Mountain Indian reservation, by W. G. McDonald, J. H. Jacks and B. Jones.

MOHAVE COUNTY.

The Grand Gulch mine is located about 40 miles northeast of Gregg's Ferry, on the north side of the Colorado river. Jennings Bros. have control of the property and have been opening the mine for extensive future working. A two-compartment shaft is down 400 feet. A 40 H. P. gasoline hoisting engine has been installed. During 1901 a production and shipment of 100 tons of ore monthly has been maintained. The average copper content of this ore is claimed to have been 48%.

The Empire Flat copper mines are reported sold to New York people, who it is stated will soon have a force of men at work. The mines are located about 6 miles from the Colorado river, near the mouth of the Bill Williams.

The Yellow Aster mine, near Kingman, is reported to show in the bottom of the shaft ore which goes fifteen ounces in gold and eight ounces silver to the ton. The mine is owned by E. H. Harrison, H. Yoe and J. C. Hughes.

It is reported that on the 300 level of the Schuylkill mine, at Chloride, a big ore body has been cut in a crosscut. On this level a recent flow of water compelled the temporary stoppage of work. It is now under control and used for the operation of the mine.

It is reported that the Philadelphia & Arizona people have leased the water of the Payroll mine, at Chloride, and will at once pipe it to the mill at the Minnesota-Connor mines. The work of sinking on the Minnesota is going steadily and is in ore.

On the 500 level of the Schuylkill mine at Chloride, W. D. McNeil Supt., a rich body of silver ore has been struck. The ore shows a large amount of native and ruby silver all through it.

S. C. Bagg, manager of the New Comstock M. Co. of Los Angeles, Cal., has taken a long term lease of the Sheeptrail mill, near Chloride, and intends at once to put it in shape to operate on Catherine mine ore.

PINAL COUNTY.

J. McCarthy, Supt. of the Bryan group, near Riverside, is at work drifting in ore on the vein from the bottom of the No. 2 shaft, at a depth of 100 feet.

Supt. Brown of the Fernando M. Co. has taken over the Chamberlain properties of the Willow Springs, which were bonded to the Fernando Co. by M. R. and F. A. Chamberlin, the final payment having been made.

SANTA CRUZ COUNTY.

The Hardshell mine, near Nogales, closed last year by a cave-in, has been reopened by R. R. Richardson.

YAVAPAI COUNTY.

G. A. Wright, representative of the English syndicate of London, has bonded at $30,000 the Mountain View and Northfield gold claims, situated in the Black Canyon district, 30 miles from Mayer, from D. Care of Bisbee and L. Erikson of Congress. Contracts for $3000 worth of development work have been let. Mr. Wright will superintend the opening up of the property.

The McCabe Extension Co. at McCabe has installed a new engine and dynamo to increase the number of electric drills and to light the town. Light contracts have, it is claimed, been made covering the expense of running the plant. A new steam hoist has been placed on shaft No. 3. Ore shipments will be made from the property as soon as tests under way determine the very best process of treatment.

L. D. Phillips of Douglas, Lacey & Co. has bonded the Perry and Elk mines, near Prescott, from C. Capelli. The Perry is an old mine and has produced a large amount of silver ore.

D. Jones, who has bonded the Yarnell mine at Octave, has struck within 20 feet of the old workings 2 feet of ore that pays $40 per ton.

CALIFORNIA.

AMADOR COUNTY.

The Amador Reduction Works at Jackson are being fitted up with a fuel oil burning plant and will start in roasting sulphurets some time in March. T. N. Smith, formerly Supt. of the Utica mine chlorination works, is Supt.

Work on the new 20-stamp mill of the Keystone mine at Amador is nearing completion. It is to be run by electric power. The 300 H. P. compressor has been started and tested out satisfactorily.

At the Bunker Hill mine the work on the 1400 station has been completed and a crosscut driven to the vein. Drifts are now being extended north and south on this level.

It is reported that in the Kennedy mine the large ore bodies are now being developed on the 2300-foot level, which equal in extent anything before developed on the mother lode. For some months the company has been running the entire mill on this ore body, which is 80 feet in width. It is stated to be the intention of the company to erect a new 60 or 80-stamp mill in the spring, also a hoisting works for the East shaft, where the new mill is to be located.

V. S. Garbarini has been working for several weeks past on the plans for the new hoisting works to be erected over the east shaft at the Kennedy mine, at Sutter Creek. This hoist will be of 100 H. P. and capable of sinking 5000 feet. Five-ton skips are under consideration to run at high speed. The construction of the hoist will probably be started as soon as the plans are completed and approved. It is said that the work will be done by day labor, with V. S. Garbarini in charge.

The mill at the Zeile mine, at Jackson, has been started up again after a shut down of two months. A large force of miners have been put to work.

BUTTE COUNTY.

A contest is on in the Butte County Court, entitled Goodall Estate vs. W. P. Lynch, over the right of the Lynch Co. to run the tailings from their mine upon the Morris Ravine property, which belongs to the Goodall estate, and rework them there. After running these tailings onto the Morris Ravine property, the Lynch Co. attempted to work the tailings, to which plaintiff objects and claims that when these tailings are run onto their ground it becomes their property, and that, if there is any gold in the tailings, it also belongs to them.

CALAVERAS COUNTY.

The Etna gravel mine, situated near Angels, idle for the past five years, is now to be unwatered by the owners, J. Pierano and R. Lemue, of Angels. The shaft is 230 feet deep, with about 195 feet of water in it. At the 200 level is a 500-foot drift.

DEL NORTE COUNTY.

Mr. McCarthy of San Francisco and formerly of Keswick, Shasta county, has bonded for one year at $70,000 sixteen copper claims from Jackson, Davis, Baker, Ray and Diedrick on Diamond creek, near Waldo, Or. He proposes to start development work the first of April.

KERN COUNTY.

G. W. Lloyd has started his new mill on the Phœnix mine, Johannesburg.

LOS ANGELES COUNTY.

T. W. Brooks of Pomona has located several claims on discoveries of orthoclase which he proposes to exploit to provide the basis of a potasslum salts industry.

MARIPOSA COUNTY.

The Figel-Grimm M. & M. Co. has been incorporated in Stockton, to develop copper mines on the company's land in the vicinity of Whiterock. The land is the C. K. Myers 160-acre tract, which was bought in at tax sale by E. P. Figel.

NEVADA COUNTY.

The mill building of the Crystal Lakes M. Co. at Meadow Lake, near Cisco, was blown down in a wind storm. The stamps and batteries escaped damage, but the minor machinery is more or less injured. The building will be rebuilt in the spring.

The Reward mine, at Nevada City, has been sold to the Gold Tunnel Co. G. Levinsky, president of the Gold Tunnel Co., states that it is the intention of the company to remove the Reward machinery to the shaft of the California mine, which the company owns. Through this shaft the Gold Tunnel and Reward claims can be worked to advantage.

PLACER COUNTY.

The limestone quarry on Bear river, near Colfax, is to be utilized for manufacturing lime. The H. T. Holmes Co. of San Francisco has bought the quarry and is preparing to install a patent lime kiln, with a capacity of twenty tons per day.

SAN BENITO COUNTY.

A company composed of San Jose, San Benito and San Francisco people, headed by T. Flint of San Juan, Treadwell Bros. of San Francisco and H. R. Bradford of San Jose is preparing to open and develop the Cerro Bonita quicksilver mines belonging to the Flint estate.

SAN BERNARDINO COUNTY.

J. McGrath is said to have struck a body of ore in a mine near the Brooklyn at Dale.

Castainy, Laprairie & Ganchou are taking out some very rich ore from the Bon Ton mine. This is the only one of the old placer claims that is being worked. The ore of Dale district is, as a general thing, very base.

SHASTA COUNTY.

The new mill of the Mount Shasta G. M. Co. at the Mount Shasta mine on Clear creek, near Shasta, is expected to be crushing ore by April 1st. A. S. Gabbs is Supt.

SISKIYOU COUNTY.

A carload of cyanide vats and apparatus is en route to C. F. Richards at Oro Fino.

J. Hubbard, W. Quigley and others intend putting in a wing dam above Oak Bar, at Klamath river, as soon as the stream gets down lower, to work the river bed.

J. Crawford of Etna, who recently bought the Silva placer mine on Patterson creek, has rigged it up with a hydraulic plant and is running with a full head of water for the spring season.

G. Henderson of Fort Jones has recently bonded the Trace quartz mine, in Vason gulch, from J. Lewis, and has men employed developing it.

H. J. Barton of Yreka and associates are projecting the construction of a ditch from Beaver creek down the Klamath river for a distance of 10 miles, to work several high bars of placer ground. The ditch is to carry about 5000 inches of water, and is estimated will cost about $40,000. A hydraulic mining plant and pipe lines will be installed.

Newkirk & Co. of Detroit, Mich., are getting down to bedrock in their claim at Buckeye Bar, near Yreka, with a hydraulic elevator.

The Siskiyou Hydraulic M. Co. of Paris, France, F. Beaudry manager, operating at Callahans, is now running eleven giants, with about sixty men employed.

F. Talbot has taken an eighteen ounce nugget from his claim at Slug gulch, a tributary of Cherry creek, near Yreka.

The Punch Creek mine at Humbug, owned by Yreka people, has commenced operations again.

W. Long, foreman of the Salmon River Co.'s mines at Sawyers Bar and Summerville, started the giants on the Summerville property on the 12th inst. Mr. Long states that the plant at Sawyers Bar is running steadily day and night, and that if everything is favorable this season will finish working off all of the pay gravel where the plant is now situated.

A. Colburn is drifting on Colburn Bros. mine, near Cecilville, prospecting preparatory to the hydraulic mining of it. The claim prospects run from $3500 to $10,000 per acre. They intend to bring in a ditch from Cecil creek and install a pipe and giant on the property.

TRINITY COUNTY.

C. Scranton, formerly Supt. of the Maple Creek M. Co., has bonded until June 1 the Carr, Sheridan and Post claims, situated on the Trinity river above Junction City. Mr. Scranton represents J. R. Guilph-Norman & Co. of San Francisco. If the company takes the property, an electric power plant is projected to raise water from the river for mining purposes.

W. Clements reports the Gold Dollar hydraulic mine, on Canyon creek, near Dedrick, owned by Gilzean, Davis & O'Neil, as running one giant from a reservoir. The gravel is a high bar, the gold coarse and easily saved. The bank runs from 20 to 50 feet in height and is nearly all gravel. The water is carried from the reservoir to the mine in a 15-inch pipe under a 150-foot pressure. Considerable coarse gold, ranging in pieces of $1 to $20, have already been found on the bedrock. The character of the gravel, it is stated, resembles that of the Sweepstake mine, near Weaverville.

Supt. McCoy has begun work on the ditch tunnel from Garden gulch to Munger gulch for the Sweepstake Co. Cars and other working materials are on the ground. The tunnel will be about 1200 feet in length.

It is reported that the Americas G. M. & M. Co., developing the Hall property at Hall City, has struck ore in its crosscut on the Providence claim. The crosscut has been driven 340 feet to the vein and the strike is reported to be the best so far made on the property. It is anticipated that it will result in the erection of a 10-stamp mill in the spring. Development work has been in charge of W. T. G. Polk.

TUOLUMNE COUNTY.

A company composed of fifteen Sonora and Carters people, with J. L. Gibbs of the latter place as secretary and treasurer, are running a tunnel at Arrastraville to tap an old river channel. The tunnel is now in about 100 feet, and it is expected that 1000 feet will have to be run before striking the pay gravel.

Fine ore is reported struck in the main tunnel of the Riverside mine, on the north slope of the Stanislaus river near Columbia. It is being operated under bond by DeHaven & Co.

The Ferris placer claim, at Yankee Hill, out of which was recently taken a $2300 nugget, is being steadily worked.

COLORADO.

CLEAR CREEK COUNTY.

The Champion and Specie Payment mines, at Idaho Springs, are to be consolidated and both worked through the shaft of the Champion. The shaft of the Champion is down to about 1000 feet and is only 200 feet from the Specie Payment line. By crosscutting, the latter will be opened at about 500 feet below the present depth. In the Specie Payment the smelting streak is from 18 inches to 2 feet, and runs over $80 a ton. With it is fully 10 feet of mill ore that is netting $7 a ton on the plates. The company has bought the Donaldson mill, which belonged to the owners of the Champion.

The Buckeye Tun. & M. Co., a new organization, will soon commence active operations near Georgetown. G. Warner of Denver is vice-president and manager of the company, and L. D. Timmons, also of Denver, is secretary and treasurer; O. Shepard is Supt. The properties of the company lie on Democrat mountain and consist of the Buckeye State, Edward VII, Crown, Buckeye Extension, Refuge, Emida and Ellabelle lode claims, together with the Buckeye tunnel site.

The Mineral Chief group, at Georgetown, has been bought from the R. O. Old estate by the Linn Con. M. Co., which has been operating in the district on some property owned by it on Republican mountain, adjacent to the Mineral Chief. W. C. Hood is manager and F. A. Maxwell treasurer, at Georgetown.

F. A. Maxwell has sold his Mendota mill at Georgetown to the Old estate. The mill was erected several years ago for the purpose of treating the Mendota dump. It is estimated that there are many thousands of dollars' worth of ore in this dump, and now that the mill and mine are under the same management, arrangements will be made to treat it on a larger scale.

Despite difficulties from intense cold, that freeze the source of water supply to the extent of almost stopping the flow in the creeks of the vicinity during the fore

part of February, the Empire tunnel, at Empire, was driven 94 feet in twenty rounds during that month. With the number of drills used and men employed, this makes the cost of the bore greatly below that of any similar enterprise in Clear Creek. The main quartz streak, 30 inches wide, has been intersected and found to carry ore of a concentrating grade.

Five men, working five shifts, in the Wisconsin mine at Silver Plume, took out 1142. It cost about $75 to take out the ore, which thus netted $1067.

R. C. Vidlor of the Horseshoe tunnel at Argentine is, it is reported, to immediately install a compressor plant on the tunnel. The tunnel as designed will be from 7000 to 10,000 feet in length.

GILPIN COUNTY.

The Fairfield M. Co. has been incorporated, capital $500,000, to operate the Fairfield mine, near Russell. Delaware and Maryland people are to be the operators. The property has been owned by E. W. Williams of Denver.

The shipments of ore, tailings and concentrates from the Black Hawk depot for February to the smelters and outside treatment plants were 310 cars, aggregating 5735 tons. In comparison with the same month of 1901 the shipments show an increase of forty-six cars, or 850 tons.

A free-gold strike has been made in the 420-foot level of the East Notaway mine, in Lake district, by J. H. LeMoyne, who is leasing in the mine. The ore shows sylvanite as well as free gold. The property is being worked by the Town Topics Co. under Manager Josephi. A new and more powerful hoisting plant is to be installed during the next sixty days.

LAKE COUNTY.

The lessees on the A. Y. and Minnie mine, at Leadville, have recently made a shipment of 200 tons zinc-lead ore to the A. M. W. mill for the purpose of testing it. The character of the A. Y. and Minnie zinc ore is somewhat different from that of the Adams, and by running it over the A. M. W. tables the lessees can ascertain just what sort of a concentrate can be obtained. Until it can be ascertained just what can be done with the low-grade Minnie ore, no move will be made to remodel the Minnie mill.

PARK COUNTY.

A. B. Davidson, F. Clark and G. H. Nero have taken a two-year lease on the Jim Blaine mine, in Buckskin, from J. Moynahan of Alma. The property carries gold, silver and copper. It is the intention to work the property for the shipping ores.

SAN JUAN COUNTY.

The Irene mine, near Silverton, owned by C. S. Casad, has been a small shipper for several seasons. Late last fall Mr. Casad let a 100-foot contract to drift on the vein. On this contract an ore shoot has been opened that runs 624 ounces silver per ton, with small values in gold.

The Notaway M. Co. at Silverton has just completed connecting a new set of electric drills in the lower or Thunder tunnel. The holes are being driven about 35 feet to the shift. The company proposes to build a tramway from the mouth of the Thunder tunnel to the railroad track and all the ore will be loaded automatically into the cars. The different tunnels will be connected by shafts or upraises and all ore will be shipped through the lower tunnel.

TELLER COUNTY.

Peterson & Stone, who made a strike on the Laura Lee, on Mineral hill, at Cripple Creek, in a drift from the 100-foot level, have been sinking and raising on the ore. In the upraise the ore widened out to 2 feet. The gold is free and is in wires, chunks and splotches. The property is now being developed with a horse whim, but a steam hoisting plant is to be installed, with possibly a compressor and air drills.

IDAHO.

ADA COUNTY.

J. W. Burton of Salt Lake City, Utah, who owns in the Ella Hill group at Neal, says there are nineteen stamps distributed among five small mills operating at Neal. The greatest depth of workings is on the Daisy, 370 feet. The owners have equipped it with a 5-stamp mill and are taking from the plates $10 gold per ton and saving concentrates that go from $100 to $350 per ton. An equally good showing is made at the Homestake mine, adjoining.

BLAINE COUNTY.

W. H. Dowe of New York and F. M. Stone of San Francisco have been examining the projected mining operations in the Wood river country, near Hailey, by H. L. Hollister. They state that a company to be called the Idaho Con. G. M. Co. would be incorporated to operate the enterprise, and that it would be a close corporation with probably no more than fifteen stockholders. Mr. Dowe states that 100 stamps would be in operation within four months. The mines owned by the company are the Crœsus and Crœsus Extension, the Hattie, the Big Camas, the Bird group and the Montana group. The Crœsus, Big Camas, Hattie and Golden Star all have bodies of ore opened up. On the Crœsus there is a 10-stamp mill. This will be replaced by a 40-stamp mill. On the Hattie a 20-stamp mill has been erected. The Golden Star has a new mill of twenty stamps. On the Big Camas a 40-stamp mill is being erected. Power for all of these is to be taken from Shoshone falls in the Snake river. J. J. Blow, formerly of Leadville, Colo., is Supt.

IDAHO COUNTY.

G. W. Armour, lately from Thunder Mountain district, says that there is a widespread area, all of which is gold bearing, and yet there is no quartz and no trace of any other than volcanic rocks. There has been and still is a mistaken notion relative to Thundor Mountain that it is a mining region of extremely rich ore. In point of fact, it is destined to be a great low-grade camp. But there are some advantages connected with it. First, there will be no waste from mining operations. The ore cannot be sorted, as rich and poor ore look alike. It is soft and easily worked; a stamp that will work two and two and a half tons of ordinary ore will work six and seven tons of this. The mining will largely be done in open cuts, and including milling, when a large plant is put in, the total expense should not exceed 60 cents a ton.

KOOTENAI COUNTY.

The Richmond G. M. & M. Co. at Tyson is driving a tunnel, now in 150 feet. It is expected that the Richmond ledge will be reached in 60 feet additional. The tunnel will then be continued until it reaches the War Eagle ledge. The success of the development made will, it is said, insure the early establishment of a mill.

LEMHI COUNTY.

R. M. Edwards and J. P. Rice, of Houghton, Mich, have organized a company under the laws of New Jersey to develop the Kittie Burton claims, near Salmon City. New York and Houghton capitalists are interested.

OWYHEE COUNTY.

The DeLamar mine of DeLamar, situated at an altitude of 6500 feet, was located by J. Wilson and sold to Capt. DeLamar in 1887. He sold the mine to the DeLamar M. Co., Ltd., in 1890. The mine has sixteen levels, two of which—four and eight—are adits from the surface. The extreme length of No. 4 is 2505 feet and of No. 8 to incline 2130 feet and to end 3080 feet. During Capt. DeLamar's time the output was $2,000,000, the expense $1,000,000. Under the DeLamar M. Co., Ltd., control, the output has been $7,723,926, expense $4,513,388, making a clear profit of $4,210,538. To solve an important question, a tunnel—the Mill tunnel—7½x7½ feet, was started, and on Sept. 1, 1899, the tunnel was in 250 feet; from this date to Dec. 22, 1900, and from May 6, 1901, to June 3, 1901, total 477 days, the tunnel was advanced 5667 feet, taking out 48,500 cars of waste. The average daily advance was 11.9 feet. No deductions were made for holidays or lost time. Men employed, twenty-one to twenty-nine; average, twenty-six. Powder used, 55,750 pounds No. 2 Hercules; fuse, 160,900 feet; caps, 22,600; candles, 200 boxes. Two machine drills were employed. The rock was hauled out by mules in trains of six 1400-pound cars. From start, Sept. 1, 1899, to March 31, 1900, 212 days' run in hard basalt made an advance of 2720 feet, or nearly 13 feet per day. December, 1899, thirty days' run in hard basalt was 436 feet, an average of 14½ feet per day. The tunnel construction was in charge of general Supt. T. Davey, under Manager D. B. Huntley, who preceded the present general manager, E. V. Orford.

SHOSHONE COUNTY.

Suit to quiet title to the Crown Point lode mining claim at Yreka has been commenced in the United States District Court by the Cœur d'Alene Development Co. against P. Flynn and J. F. McCarthy.

WASHINGTON COUNTY.

L. Rosenzweig, representing C. Reed of Erie, Pa., the owner of the Iron Dyke mine in the Seven Devils district, and the Northwest Railroad, has, with Manager F. E. Pearce, made an inspection of the mine. Mr. Rosenzweig announces that the work of prospecting and developing the mine will be pushed from now on. It is understood to mean that the railroad will be completed at an early date.

MICHIGAN.

HOUGHTON COUNTY.

President Stanton of the Baltic Copper M. Co. at Houghton says in his annual report that the anticipations expressed in former reports of a gradual increase in the average yield of the rock treated, as openings should be extended, have been realized, the returns showing an average yield per ton of rock stamped of 23 pounds of ingot copper, against 19 58 pounds in 1900, and 17 pounds in the six months' stamping in 1899. Details of expenditure given in the report show: Rock stamped, 114,703 tons; product of mineral, 3,564,670 pounds; product of refined copper, 2,641,432 pounds; yield of rock stamped, 23 pounds per ton, or 1.15%.

MONTANA.

The receipts of gold at the United States assay office at Helena for each month show an increase over those for the corresponding month of last year. Those for February, 1902, were $130,314 41, an increase of about $10,000 over those for February, 1901. The receipts of gold in February, 1902, were 8,913 47 ounces, compared with 8,478 33 ounces in February, 1901. This total was divided as follows: Montana, $86,236.97; Idaho, $18,052 42; British Columbia, $17,596.46; other States, $8,428.56 Of the receipts from Montana, Lewis and Clarke county contributed $40,846.06; Park, $17,586 07; Madison, $14,415.70; Fergus, $8,081.94.

BROADWATER COUNTY.

F. D. Miracle, who owns a controlling interest in the Frieberg mine, near Winston, has bonded it to Whitehead Bros. and J. Newell. The property is developed by two tunnels on the lead, one of 800 feet and the other 600 feet. The bonders propose to work ahead on the upper tunnel, which is on the lead 600 feet.

CASCADE COUNTY.

The American S. & R. Co., it is reported, has decided to spend a quarter of a million dollars in remodeling the old silver smelter at Great Falls. This work is to be done at once and is to be completed this summer. It is understood the company intends making this one of the chief smelters in the West and will make a direct bid for the ores of the Cœur d'Alenes, as well as those of the camps on both sides of the international boundary line, which the Great Falls & Canada and Great Northern branches reach.

At the refinery of the B. & M. smelter at Great Falls the world's record for day's output of copper ingots was broken by 19,000 pounds. The previous record for the world was held by the Great Falls smelter at 71,000 pounds of ingots. The new record is 90,000 pounds of copper in ingots.

CHOTEAU COUNTY.

A discovery has been made at Highwood of an extensive deposit of sapphires. The stones when cut have a brilliant color like that of the Yogo variety, but more smoky.

FERGUS COUNTY.

Considerable development work is being done on the Philippine group at the head of Armells creek, near Kendall, by C. A. Case, who states that ore taken from the prospects ran from a trace to $3.60 in gold. A stratum of volcanic cinders has been encountered, which runs from $1.20 to $2.10 in gold per ton. The ore is suitable for treatment by the cyanide process.

FLATHEAD COUNTY.

The West Fisher G. M. Co. of Libby, J. Brannagan manager, has let a contract for a 100-foot extension of the tunnel on its Last Chance mine in the West Fisher district at $12 a foot. The tunnel is now 100 feet long and at the face the ledge is 13½ feet wide. It is reported that the company will install a 10-stamp mill plant in the spring.

GRANITE COUNTY.

T. L. Wall of Preston, S. D., representing the Deadwood Smelting Co., and P. C Waite, the cyanide expert of Bozeman, have made an examination of the Mountain Ram group, near Phillipsburg, owned by S. F. King and J. A. Murray of Butte. Considerable development work has been done and a large body of cyaniding ore has been exposed on the various levels. The Deadwood Smelting Co. is expected to install a cyanide plant and at once begin the operation of the mine.

The Rock Creek M. Co., which proposes to mine gems and precious stones, cut and sell them at wholesale and retail, has been incorporated, with office at Bimetallic, and capital $200,000, by C. D. McLure, A. B. Ewing, M. Rumsey and H. S. Rumsey of St. Louis, Mo., P. A. Fusz of Granite and F. D. Brown of Phillipsburg.

MADISON COUNTY.

At the Lester mine, near Pony, the strike of a new lead of free gold ore is reported. The owners, Armour & Jeffrey, are getting out a carload of this ore for shipment. The principal ore bodies of the Lester are in a large low grade vein of cyaniding ore. No plant for their reduction has been constructed.

The South Boulder M. Co., operating mines on the south slope of Hollow Top mountain, near Pony, has completed a two months' test run of ore in its new 10-stamp mill, and it is understood the saving on the plates, followed by concentration, was very close. The mill has been closed down until the water power can be used.

The Butte & Potosi M. Co. have driven a crosscut tunnel 110 feet, tapping the ledge in the mine, near Pony, 100 feet down. At this point 9 feet of steel galena has been opened, carrying 60% lead, $48 in gold and twelve ounces silver. It is reported that the company will erect a 100-ton concentrator in the spring.

C. E. Damours of Virginia City has been developing a ledge of gold ore in the Summit district. He expects to put a plant on it this summer.

PARK COUNTY.

The National Park G. M. Co. has been incorporated in Great Falls by D. Noble of Cooke City and associates with capital of $100,000. The office will be at Great Falls and the company will operate the Little Pittsburg, the Noble, the Triangle, the Silver Fraction and the Money King claims, near Cooke City.

SILVER BOW COUNTY.

The Miners' Union claim at Butte has been bonded to F. A. Heinze for $150,000. The property is owned by G. W. Stapleton, J. Noyes, P. J. Brophy, G. H. Casey and Josephine M. Lyons. It is said to be Mr. Heinze's intention to work the ground through the Cora mine, adjoining, on which he has sunk a 1000-foot shaft.

NEVADA.

ESMERALDA COUNTY.

Durkee, Gardner and Fearoy, the committee sent from New York to examine the mines in Hawthorne district recently bought by the Con. Esmeralda Mines Co., after spending several days at the mines, indicate that the work of bringing in water from Cottonwood canyon and the building of a mill near the mines will soon begin. J. A. Yerington of Carson City is manager for the company.

LYON COUNTY.

W. D. Davidson and J. Z. Lockwood, who have been operating a claim near Cambridge, claim to have a fine showing of ore that yields well to cyaniding, some of the assays going as high as $42 per ton. A contract has already been let for the running of a 100-foot tunnel.

NYE COUNTY.

The following directors have been elected in the Gold Hill M. Co. in Tonopah: J. L. Butler, W. Brougher, C. Brougher, J. W. McCulloch and T. L. Oddie. The officers elected are: J. L. Butler president and T. L. Oddie secretary.

The Ohio-Tonopah M. Co. has been incorporated in Youngstown, Ohio, with F. H. Schmidt president and C. S. Cook secretary and treasurer, both of Youngstown, and S. A. Knapp manager at Tonopah. The company's property comprises five claims extending west and southwest and covering the line of extension of the Mizpah, Burro and other principal ledges of the main developed group. The present shaft is 90 feet deep, and it is the intention to cut the shaft out to two compartments, put in a hoist and sink through the surface porphyry here estimated to be about 400 feet thick, into the lode bearing porphyry which underlies it.

The New York G. M. Co. has been incorporated in Salt Lake City, Utah, capital $37,500, with G. A. Land as president and E. L. Hall treasurer and secretary. The company owns three mining claims at Tonopah.

WASHOE COUNTY.

The Monte Carlo mine, near Reno, has been bonded to San Francisco people at $15,000, some cash down. The ledge is well defined and carries gold, silver, lead and copper.

The Jokor, Go Down, Aurora and Barstow claims at Granite hill, near Rono, have been sold to E. Kane and B. Duncan by T. H. Deegan, H. Anderson, M. Gotisola, J. Kellock and J. A. McDonald. These properties have been good shippers for the past two years.

A new strike has been made in the Wedekind mine, near Reno. At a depth of 27 feet, in a new shaft, 5 feet of ore, running, it is stated, over $2000 a ton, has been encountered. A second shaft has been started 100 feet away on the trend of the formation and at 6 feet depth picked up the lead, 4½ feet wide and assaying $3380. The ore is gray silver chloride and sulphide of silver. It is very heavy and carries a little antimony. There is from ten to twenty ounces of gold in the rock. The mine is owned by J. Sparks of Reno.

WHITE PINE COUNTY.

At the annual meeting of the Rocco-Homestake Nevada M. Co. of Hamilton, held in San Francisco on the 27th ult., O. J. Smith was elected president and M. Bernard secretary. The company bought from B. L. Smith and H. A. Jackson the Rocco, adjoining the Homestake on the north, and Rocco No. 2 mine, adjoining the Rocco on the east, and also the

Mother Ledge claim. The company has also made arrangements to buy from the present owners of record all of the Last Chance mine, adjoining the Homestake on the west.

NEW MEXICO.

GRANT COUNTY.

The two principal turquoise operators in the Burros mountains, near Burros, at present are the Azure Co., owning fourteen claims and employing fifteen men steadily, and the Gem Turquoise & Copper Co., owning fourteen claims. Both companies are said to be shipping large quantities of stones to Eastern markets. The Porterfield Bros. are also working a few men on their five claims.

The Faywood Lead Co. has been organized under the laws of the State of Delaware, with a capital stock of $100,000. The company will operate a silver-lead property located in what is known as Cook's Peak district, and about 20 miles from Faywood, a station on the Santa Fe road. Preparations have begun for the erection of a concentrating plant upon this property. The officers of the company are: A. P. Nevin president and E. F. Thieler treasurer.

SANTA FE COUNTY.

H. Grant says that the contract to move the dredger on the Chama river from the place where the flood drifted it to its former place has been let to S. C. Battleson. The dredger will be taken apart and carried overland. A company has been organized with $120,000 capital to work the dredger on the Chama placers.

SOCORRO COUNTY.

The Grapevine Lead Co., with a capitalization of $100,000, has been organized under the laws of Delaware to operate a silver-lead property near Lava, Socorro, New Mexico, in the San Andreas mountains. A 70-ton concentrating mill, using dry concentration, is being erected. The officers of the company are R. C. Ely president and J. Minot treasurer, of New York.

OREGON.

GRANT COUNTY.

The last payment on the Oro Fino mine, near Alamo, has been made by Glass & Witherop of Spokane, Wash., who held the property under bond. A mill test is about to be made to determine the average value of the ore and to indicate the best method of treatment. The mill test heretofore made at the Red Boy mill ran $80 per ton in free gold alone.

JACKSON COUNTY.

Drilling machinery is being installed by the Southern Pacific Co. at its coal mine near Medford. The drill will be used in testing the coal vein in different places on Roxy Ann mountain. A tunnel has been run 120 feet in the mountain, developing a good quality of coal in a vein too small to supply a large consumption. The company has bonded a number of tracts of land and will make a thorough test in order to develop the vein at a wide point. The coal is claimed to be of excellent quality.

T. Sutton and F. Reese have sold their Roaring Gimlet mining properties on Kane creek, near Gold Hill, to W. Baisley, of Trustee, Indiana, and W. Mendenhall, of Richmond, Indiana, representatives of an Eastern company, for $10,000. This property consists of three claims. The greatest depth of present workings is 90 feet. Messrs. Sutton & Reese bought the properties about one year ago of Messrs. J. J. Houck and J. H. Mitchell for $3000. Since obtaining possession they have mortared and milled about $10,000. It is locally reported that the recent purchaser will have a steam hoist and pump erected in the near future to better facilitate the present mode of operation.

JOSEPHINE COUNTY.

T. W. Morgan-Draper of the Waldo S. & M. Co., at Waldo, has let contracts for the No. 1 Lyttle tunnel, which is to be 500 feet long, 6 feet 6 inches high; 4 feet 6 inches wide bottom and 3 feet 6 inches wide at top; and No. 2 Cow Boy tunnel, which is to be 600 feet long, 6 feet 6 inches wide at bottom and 3 feet 6 inches wide at top. The company will this summer install a smelting plant of large capacity.

W. H. Hamlin has sold eight acres of land on Rogue river, near Grants Pass, to a mining company operating in the Dry Diggings district. The company proposes to dam Rogue river near the point where they have bought this land and with hydraulic rams raise water from the river to the mining ground.

SOUTH DAKOTA.

CUSTER COUNTY.

(Special Correspondence).—Many mines which have been closed down for the winter are now resuming work and the outlook for successful work is considered good. The Globe mine, with a group of ten claims, has been sold by C. Haserodt and C. Harbach to the Wabash M. Co., of which J. F. Sidey is manager. The consideration is $100,000. Work in the tunnel will be resumed and the sinking of the main shaft continued.

The Saginaw Co. are sinking an incline and prospecting with a diamond drill. Good progress is being made drifting on the vein in the Crown mica mine. F. C. N. Graydon is Supt.

Custer, S. D., March 8.

PENNINGTON COUNTY.

The Imperial Co. has added to its holdings in Blacktail by buying from H. B. Young the Peorla lode claim for $12,000.

The Homestake G. M. Co. at Lead has paid the 280th consecutive monthly dividend. The whole sum now aggregates a total of $10,863,750.

J. Gray, Supt. of Wasp No. 2 at Lead, reports 585 ounces of gold, the product of eleven and one-half days run.

The new Imperial 200-ton cyanide mill of Deadwood started on the 3d inst.

The Spearfish cyanide mill in Johnson gulch will start up on the 10th inst. with 300 tons daily capacity.

UTAH.

BEAVER COUNTY.

The Jayhawker M. Co. has been incorporated to develop a mine near Frisco. P. Ryan is president and E. McGurrin is secretary and treasurer.

The Majestic Co. made another payment of $15,000 on its properties near Milford, making $35,000 paid since the first of the year. The last payment was upon the O. K. and Harrington-Hickory options.

BOX ELDER COUNTY.

The Seasame G. & S. M. Co. has been incorporated in Salt Lake City, capital $30,000, F. T. Wilson president and A. F. Waltz secretary and treasurer. The company owns five mining claims in Park Valley mining district.

IRON COUNTY.

In an article of the issue of February 22, on Stateline, it was stated that it was expected that in the Margaret the main ore shoot would be found on the 150-foot level. That is now reported as having since been done, the vein said to be 4 feet wide, the ore assaying $10 per ton and better.

JUAB COUNTY.

R. D. Grant of Salt Lake City has given an option at $175,000 for six months on the Sioux and Utah groups of mines at Tintic to J. A. Underwood, Supt. of the Carisa M. Co. at Tintic. The territory embraced consists of thirteen patented locations and in former years has been productive.

PIUTE COUNTY.

The Madsen M. & M. Co. at Kimberly will, it is reported, soon commence the building of a long flume, several miles of road and the erection of a mill and power plant for the Trapper's Pride mine. A. D. McLean is Supt.

SALT LAKE COUNTY.

T. Jacobson, manager of the Columbus mine at Alta, says the mine will be provided with a concentrator the present season. He has, he says, now blocked out for such a plant 4000 tons of ore that will go $18 per ton in silver, lead, copper and gold. He is shipping ores to the smelter that shows 35% lead, twenty ounces silver, 3% copper and $1.50 gold per ton.

SEVIER COUNTY.

The L. & N. group of mining claims, near Marysvale, owned by L. Wilson, H. N. Hayes and W. C. B. Twock of Richfield, are said to be showing 70 feet of ore. The shaft, now down 50 feet, is in ore which assays, it is said, over $13 in gold and thirty-six ounces in silver.

SUMMIT COUNTY.

Operations at the Bogan mine at Park City have ceased and the pumps have been drawn. Manager Spiro says the company has reached that point where the equipment is inadequate to the task of operating economically. A greater steam making capacity, a compressor and power drill plant are required. After the spring breakup, when the roads are again in good condition, the company will get the additional equipment required and operations will again be resumed.

J. Farrell, president of the Quincy M. Co. at Park City, says there are about 3000 persons upon the payrolls of Park City mines and about $270,000 is distributed monthly in wages. From the mines is now coming, says Mr. Farrell, an average of 450 tons of ore daily. The camp is without an idle tenement or vacant storeroom and preparations are being made to erect many new structures.

TOOELE COUNTY.

The superintendent of the Con. Mercur tailings mill at Manning has emptied its leaching tanks, converted their contents into gold bullion and closed down until the warm sun of April renders it possible to start up again. Cold weather has made it difficult to handle the tailings. It is said that the plant has been adding from $400 to $600 daily—according to the auriferous contents of the tailings—to the company's earnings.

UTAH COUNTY.

The Granite M. & M. Co. of Santaquin has been incorporated to operate a mine in Utah county, with a capital of $6000, L. Openshaw is president and T. B. Hillis Jr. is secretary.

WASHINGTON.

FERRY COUNTY.

J. L. Harper, Supt. of the Hawkeye mine at Republic, says that the shaft is down 250 feet, showing ore in the bottom of shipping grade. It is expected that the ore will be treated at the Granby smelter at Grand Forks.

WHITMAN COUNTY.

Whitman county may have gold mines if the opinion of C. L. Craig, a miner from the Black Hills, is correct. Craig claims he has discovered on J. P. Crawford's farm croppings of ledges which show gold and silver. He has made a contract with the Crawfords to prospect the find for four months.

FOREIGN.

BRITISH COLUMBIA.

In the Bridge river gold bearing section of Lillooet district it is proposed to work the ores by arrastras. Very good results so far have been secured by those who have hitherto adopted that method. Many mine owners have concluded that the best plan at present is to use the material on the ground, build arrastras, and for each man to prove his own claim. In this way good wages can often be made.

The Hastings (B. C.) Exploration syndicate has declared a dividend of 5%. The company owns the Arlington mine near Erie. The ore values consist chiefly of gold and the property comprises eleven claims, of which only one has been systematically worked.

The Cascade mine, near Rossland, may be equipped with a concentrating plant of 75 to 100 tons daily capacity in the near future according to E. W. Thomas, the Philadelphia, Pa., agent who is connected with the property. The proposal is to erect a concentrator to handle Cascade and Bonanza ores, the company first to open up the ore bodies until from 25,000 to 30,000 tons of ore is blocked out. Concentration tests have been made of Cascade ore and it is found to concentrate about ten into one.

H. P. Jackson, manager of the Contact mines, in Burnt Basin, near Gladstone, says the mine embraces the Mother Lode group, which carries gold and silver exclusively in an ore well suited for concentrating. It is the intention to equip the property with a tramway and mill, but whether this will be done by the present company or not will be determined by circumstances. The mill will be located near the railroad and an aerial tramway to the mine can be constructed for some $4000, after which the ore could be delivered from mine to mill at a few cents per ton for transportation. The tests made show that the ore will concentrate almost ten to one.

M. H. Gilliam of the Bayonne mine, situated in the Kootenay district, near the boundary, has a tunnel started. The ore is free milling. The mine is under bond to Spokane people, who intend to test the property thoroughly. The operation of the mine would require the erection of a stamp mill and the construction of about 25 miles of road.

Work has been resumed on the White Bear mine at Rossland and it is stated that the main shaft will be sunk deeper. A new gallows frame has been erected at the shaft house and other preparations made with a view to extensive operations. Supt. Demuth states that with one power drill the crew of twelve men made 90 feet of sinking in the shaft during February. He claims that the distance thus made in the short month of the year is the record in the history of the Rossland camp.

MEXICO.

The production of silver from Mexican mines during the last three fiscal years is as follows:

	Kilograms.	Value.
1898–1899	1,417,216	$57,985,400.58
1899–1900	1,444,621	59,106,694.50
1900–1901	1,521,865	62,267,123.70

The kilogram of silver is calculated at the Mexican mint value of $40.915.

The production of copper exported during the same three fiscal years is as follows:

	Tons.	Value.
1898–1899	16,720	$4,135,613
1899–1900	28,071	9,863,902
1900–1901	32,470	11,067,538

It is stated that copper matte can be produced in Mexico in ingots at a cost of from 4 to 6 cents Mexican a pound.

The Veta Grande Copper Co. are pushing development work at their property about 40 miles northwest from Hermosillo, Sonora. They have opened up a new ledge from 15 to 25 feet in width, the ores carrying free visible gold and a high per cent of copper.

F. S. Bagley, secretary of the Mimbres C. Co. of Denver, Colo., has made the final payment of $10,000 upon the Mimbres copper mine, near La Barranca, Sonora.

L. Ginger of the Gold Coin Prospecting & Dev. Co., with Goodall Bros. of Boston, Mass., have been at San Javier, Sonora, examining the Santa Rosa mine which they had bonded.

The Carmen mine at Los Bronces, owned by A. Porchas and C. C. Rountree of La Colorada, has shipped 83 tons of ore which produced, it is stated, more than 20,000 ounces of silver. The ledge is 4 feet wide and averages 80 ounces per ton in silver. A. Porchas is Supt.

TRANSVAAL.

The gold output on the Witwatersrand during February is estimated at 81,405 ounces. This compares with an ascertained output of 70,340 ounces fine gold in January, of 52,897 in December and 39,095 in November.

YUKON TERRITORY.

The miners of the Klondike, indignant at the treatment they have received from the Dominion Government's Department of the Interior, have appealed to the Earl of Minto, Governor General, for the cancellation of the agreement of the Treadgold concession. A petition signed by 3000 business men of Dawson and gold mining operators from the creeks has been sent by special messenger and a committee to Ottawa. The attention of the Governor General himself and Sir Wilfred Laurier will also be brought to it, and by this means the miners hope to obtain redress from the encroachments of the English company that would monopolize their water supply. If an absolute reversal of the order cannot be effected the Dawson delegation will seek a reprisal by tying the company down to the narrowest limits.

An important find has been made on French hill, near Hunker creek. In bench claims large deposits of cassiterite, stream tin ore and pebbles have been found. The ore also carries gold values. The discovery has been made on a half dozen different properties.

The newest quartz deposit in the Klondike to be operated this season will be the Lone Star, owned by Americans, who have a large stamp mill erected. Dawson miners who have been last in the camp say that there will be a large development in quartz mining this year.

Commercial Paragraphs.

THE Stirling Co. is installing 600 H. P. of their water tube safety boilers at the Standard mine, Wallace, Idaho.

EUGENE DIETZGEN & CO., manufacturers of engineering instruments, drawing materials, etc., of Chicago, Ill., have opened a San Francisco store with Joseph Dannheiser as manager. The San Francisco store will carry a full line of the company's goods. It is located at 508 Market street.

THE Hendrie & Bolthoff Manufacturing & Supply Co., Denver, Colo., have purchased the Sheridan building, near the Union Depot in that city, which they will fully occupy in the near future. This building covers a large area and has four floors and basement, giving ampler room for this company's increasing stock of mine and mill equipment. Their several warehouses will continue to be utilized as usual.

THE latest series of new catalogues mentioned some time ago as being issued by the American Engineering Works, Chicago, covers perforated metal screens, mine cars, gable cars and ladle cars. The company make a great variety of wheel and axle equipment suited to every service, large special cars and light cars, as well as their standard heavy car. They add that their screen shops have unlimited capacity in fine mill screens and are actively shipping.

THE General Concentrates Co. is erecting a 70-ton dry concentrating plant at Lava, N. M., for the Grapevine Lead Co., and has just made a shipment of four carloads of machinery to that point. The plant will be equipped with a 9″x15″ Buchanan jaw crusher, 4″x12″ Sturtevant roll jaw crusher, a set of Hooper rolls and a set of Buchanan rolls for fine crushing, five Mashek octagonal revolving screens, and seven Hooper pneumatic concentrators. Power will be furnished by two Hornsby-Akroyd oil engines, 44 H. P. and 50 H. P., respectively.

THE Northern Electrical Manufacturing Co. of Madison, Wis., sends a bulletin describing the Watson type of small mo-

tors and generators, which they have recently placed on the market. These little machines appear to depart in design and construction from other small motors and generators. The frames are cast from electric steel and are multi-polar. The armatures are also built on the same plan as followed in the construction of larger machines. They have slotted laminated cores laid with form-wound coils and arranged for perfect ventilation. In appearance they are neat, compact and symmetrical. The Northern Electrical Mfg. Co. say that at present they are building these in sizes from ½ to 2 H. P.

RECENT orders for the engine type generators of the Crocker-Wheeler Co. have again given assurance of the high regard in which these machines are held by manufacturers. The company has been striving to bring these generators to such standards as will give a wide range of outputs and still maintain speeds that correspond to those chosen by the prominent engine builders. The following companies are reported to have recently placed orders for these machines: Pittsburg Reduction Co., New Kensington, Pa , one size 224, 200 K. W.; National Mining Co., Sygan, Pa., two size 224, 200 K. W.; Lake Shore & Michigan Southern R. R., Collinwood Shops, O., one size 336, 400 K. W.; Federal Lead Co., Alton, Ill., two size 224, 150 K. W.; Farrand Organ Co., Detroit, Mich., one size 111, 100 K. W.; Snellenberg & Co., Philadelphia, Pa., four size 224, 200 K. W., one size 111, 100 K. W.; Harrisburg Pipe & Pipe Bending Co., Harrisburg, Pa., one size 224, 200 K. W.; American Bridge Co., New York, one size 280, 300 K. W.; Allis-Chalmers Co., Milwaukee, Wis., one size 336, 300 K. W.; Hawley & Hoops, New York, one size 84, 75 K. W.; Hall of Records, New York, two size 252, 150 K. W., one size 224, 100 K. W., one size 67, 50 K. W.

Personal.

ARTHUR L. PEARSE, of London, is in Idaho Springs, Colo.

J. E. BEVERIDGE of Salt Lake City, Utah, is in New York.

G. CORBETT, of Virginia City, Nev., is in Tonopah of that State.

C. E. BUNKER is Supt. Keystone Con. M. Co., Amador City, Cal.

N. B. KNOX of San Francisco is examining mines at Republic, Wash.

GEO. W. GRAYSON has returned from Tuscarora, Nevada, to San Francisco.

A. J. CLARK, a mining man of Denver, Colo., is making a trip to Honolulu, H. I.

FRED S. AND JOS. J. PHEBY have gone to the City of Mexico on mining business.

WILL H. PARRY has resigned as manager the Moran Bros. Co., Seattle, Wash.

PHILLIP MIXSELL of Idaho Springs, Colo., recently returned from New York.

G. R. ERMLICH, an assayer of Durango, Colo., has opened a laboratory in Denver, Colo.

FRANKLIN LEONARD, president Comstock Tunnel Co., is visiting Lyon Co., Nevada.

GEO. T. WADE has been elected president Mill and Smeltermen's Union, Butte, Montana.

J. A. LUSK, Supt. of the Tip Top mine, Hailey, Idaho, is sojourning in Santa Cruz, Cal.

D. KEITH, of Salt Lake City, Utah, has returned to that place from a trip to San Francisco.

SAMUEL BUTLER has been elected president of the Grass Valley, Cal., Miners' Union.

PHILIP MIXSELL, of Idaho Springs, Colo., has returned there from a trip to New York.

R. C. VIDLER has returned to Argentine, Colo., from a several months' sojourn in London.

C. A. STEPHENS has been appointed Supt. of the Gold Road mines, near Kingman, Ariz.

E. S. FEINEMAN, of the Victor M. Co., at Prescott, Ariz., is sojourning in Rochester, N. Y.

H. JOSEPH has been appointed manager of the Silver Shield M. Co., at Bingham, Utah.

S. A. KNAPP, of Hawthorne, Nev., is Supt. of the Ohio-Tonopah M. Co., at Tonopah, Nev.

W. P. SCOTT, of the Black Oak mine, has returned from San Francisco to Tuolumne Co., Cal.

L. J. ROSE, of Oxnard, Cal, manager of the Red Cross mine, at Omega, Cal., is in San Francisco.

P. S. RIDER, General Supt. for the United Rico Mines Co., at Rico, Colo., is in Denver, Colo.

JOSEPH BYE is Supt. of construction of the Lenora mine copper smelter, at Crofton, Vancouver Island, B. C., and Fred Young, formerly of Butte, Mont., is resident engineer.

T. N. SMITH is the new Supt. of the Amador Reduction Works, at Jackson, Amador Co., Cal.

G. A. WANGER, who has been operating the Alexander mine, near Kingman, Ariz., is in Oregon.

J. P. WALLACE, of Kingman, Arizona, was in Denver, Colo., on the 4th inst., having ores tested.

F. H. LATHROP, manager of the Ophir mine, at Stateline, Utah, has returned from Detroit, Mich.

E. GEE has been appointed manager of the Gold King M. Co. mine at Picacho, San Diego Co., Cal.

P. H. MCDERMOTT succeeds W. J. Nelson as general manager Exposed Treasure M. Co., Mojave, Cal.

W. PARENTEAU has been appointed Supt. of the Gould mine, near Nevadaville, Gilpin Co., Colo.

J. F. FORCE, president of the Bobtail Mines Co., is at Ray, Ariz., inspecting the mines of the company.

G. W. LINDLEY, former foreman Tom Thumb mine, is now Supt. Princess Maud mine, Republic, Wash.

EDWIN E. CHASE, mining engineer of Denver, Colo., has gone to Arizona to examine a copper property.

F. S. BAGLEY, of Denver, Colo., is Supt. of the Mimbres copper mine, at La Barranca, Sonora, Mexico.

J. J. BLOW, formerly of Leadville, Colo., is General Supt. of the Idaho Con. G. M. Co., at Hailey, Idaho.

GENERAL MANAGER GEORGE H. DUNHAM of the Chainman mine, Ely, Nevada, has returned from the East.

EDWIN HAYNES is general manager Chicago & Sonora Gold Placer M. Co., Saqui Grande, Sonora, Mexico.

W. A. DENNIS, Supt. of the Mountaineer mine, at Nevada City, Cal., has returned from a trip to New York.

W. H. DAILY, general manager The Copper King, Ltd., has returned from Los Angeles, Cal., to San Francisco.

G. A. WRIGHT is superintending some mine development work for the English syndicate near Mayer, Yavapai Co., Ariz.

S. C. BAGG, manager of the New Comstock M. Co., operating near Kingman, Ariz., was in Los Angeles, Cal., last week.

W. E. NEVILLS, former Supt. Alahama mine, Tuolumne Co., Cal., has returned from Nome, Alaska, and gone to Tonopah, Nevada.

C. W. TOZIER, of San Francisco, Cal., has returned from an examination of some mines in the vicinity of Jacksonville, Cal.

A. C. MORISON, superintendent, and C. A. O'Connell, millman at the Crystalline gold mines, at Rawhide, Cal., are in San Francisco.

JAMES HEALY, former foreman De Lamar and April Fool Companies, De Lamar, Nevada, is now with the Salt Lake & Tonopah M. Co.

W. H. AUBURY has sold his Los Angeles, Cal., assay office and assumed charge of the Cyclopic group of mines, White Hills, Arizona.

D. C. MONROE, manager of the White Horse and Copper Chief mines, near Jerome, Ariz., has returned from a mine inspection trip in Mexico.

O. P. LINDLEY, late foreman of the Tom Thumb Co., at Republic, Wash., has been appointed Supt. of the Princess Maud mine at the same place.

F. D. BROWN, C. E., of San Francisco, Cal., is at Guaymas, Sonora, Mexico, in charge of the railway surveys for the Mexican Anthracite Coal M. Co.

M. F. PERRY, general manager Minas Prietas Reduction Syndicate, has returned to Sonora, Mexico, from a business visit to Virginia City, Nev.

I. L. PARKER, formerly of Rossland, B. C., has been appointed manager of the North Star mine, in East Kootenay, B. C., succeeding F. Robbins, resigned.

W. S. WARD, of Denver, Colo., has been appointed by Chas. D. Walcott, Director of the U. S. Geological Survey at Washington, to collect the statistics of gold and silver production of Colorado.

THEO. F. VAN WAGENEN, general manager Nevada Copper Co., Lovelock, Nev., has resigned and accepted the managership of a British mining company at Buluwayo, Rhodesia, South Africa. He leaves on the 20th inst. for Capetown, S. A., via London.

JOS. MCGILLIVRAY, a pioneer California miner, who has been doing considerable in the Yukon Territory since '98, was recently the deserved recipient of a handsome testimonial, including a gold watch and chain, from his fellow passengers on the down trip of the steamer Whitehorse, from Dawson to San Francisco, on the occasion of his seventy-third birthday. Mr. McGillivray returns to the Klondike next week.

JESSE SCOBEY, of Denver, Colo., has resigned as general manager Colorado Zinc Co., to take a similar position with the Pride of the West Mining & Milling Co., at Washington Camp, Arizona, the appointment going into effect to-day. Mr. Scobey succeeds Mr. Emerson Gee in the latter position.

CHARLES JANIN, recently in the employ of the Chainman Mining & Electrical Co., at Ely, Nevada, terminated his engagement and has returned to San Francisco, because of an injury to his knee which happened while he was surveying underground. He has been obliged to use crutches and to keep his leg in a plaster cast for the past six weeks. His physician hopes for a total cure before the end of the present month.

Latest Market Reports.

SAN FRANCISCO, March 13, 1902.

Catalogues Received.

The Keystone Driller Co. has issued Catalogue No. 2 on the Keystone Mineral Prospecting Machines. What is doing in perfecting methods and machines for prospecting for mines receives very full and complete illustration in this catalogue. To tangibly appreciate the rapid and considerable improvement made in this foundation branch of the art of mining this No. 2 Catalogue need only to be compared with the No. 1 Catalogue issued by the same company. Each is of its time up to the date of it. The No. 2 Catalogue is of the latest date and is commended as a text book on the subject of machine prospecting for mines. It will be mailed on application being made to the Keystone Driller Co., at Beaver Falls, Pa.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING MARCH 4, 1902.

694,516.—CAMERA—Akers & Richards, Ione, Or.
69 ,452.—WOOD PIPE MACHINE—A. Anderson, Burnett, Cal.
694,906.—IRONING MACHINE—C. W. Anderson, Los Angeles, Cal.
694,316.—COACH SUSPENDER—W. N. Burt, Los Angeles, Cal.
694,458.—CAPPING MACHINE—L. J. Borie, S. F.
694,318.—TREATING METALS—G. C. Carson, Redding, Cal.
694,528.—VOTING MACHINE—H. B. Cary, Los Angeles, Cal.
694,460.—STOVE DAMPER B. J. Casterline, Olalla, Or.
694,620.—STREET SWEEPER—W. C. Dingle, Los Angeles, Cal.
694,360.—IRONING TABLE—E. Fisk, No Yakima, Wash.
694,632.—SEWING MACHINE GAGE—G. Gorelson, Los Angeles, Cal
694,7.0.—TREE TRANSPLANTER—G. G. Guenther, Los Angeles, Cal
694,741.—RAILWAY SWITCH—G. G. Guenther, Los Angeles, Cal.
694,742.—RAILWAY SWITCH—G. G. Guenther, Los Angeles, Cal.
694,476.—TRACTION ENGINE—B. Holt, Stockton, Cal.
694,543.—CANE LOADER—A. Horner, Paauilo, Hawaii, H. T.
694,865.—TREE STAND—C. Kachold, Portland, Or.
694,554.—DOOR MAT—C. Kuhn, Fruitvale, Cal.
694,555.—SAW HANDLE—E. L. Laherty, Verdi, Nev.
694,662.—DARNING LAST—A. E. Macdonald, S. F
694,591.—KITCHEN IMPLEMENT—H. C. Needham, Los Angeles, Cal.
694,429.—ROTARY HARROW—M. Schichti, No Yakima, Wash.
694,804.—MICROMETER GAGE—J. Stromberg, Phœnix, Ariz.
694,807.—SAUCEPAN—R. B. Vanderberg, Los Angeles, Cal.
694,509.—GAME—G. W. Winckfield, Oakland, Cal.
694,514.—SCREW JOINT—F. Wulff, Colusa, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DOOR MATS.—No 694,554. March 4, 1902 Charles Kuhn, Fruitvale, Cal. This door mat consists of a frame having a grill work of interlocking patterns the edges of the parts serving as scrapers to cleanse loose dirt from the feet, and in conjunction with this is a detachable device by which the edge of the frame may be clamped upon the fibrous or

flexible mat which is subsequently used to complete the cleaning of the shoes.

DARNING LAST.—No 694,562; March 4, 1902. A. E. Macdonald, San Francisco, Cal. This device consists of a spheroid having a handle projecting from one side, a groove or channel around its periphery and an elastic ring adapted to clamp the material so that it is smoothly stitched over the outer end of the spheroid. If desired the ends of the spheroid may be provided with shallow channels crossing each other to form guides for the needle so that the mended place will be symmetrical.

CANE LOADERS.—No. 694,548. March 4, 1902. A. Horner, Paauilo, Territory of Hawaii. This device is designed for loading cane upon wagons, railroad cars or other conveyers in the fields. It consists in combination of a derrick mounted on a wheeled platform, means by which the mast of the derrick may be mounted in an essentially vertical position irrespective of the nature of the ground, and an adjustable seat for the inner end of the boom whereby the boom with its load may be automatically moved to discharge at any desired point.

DETACHABLE HANDLE FOR SAWS.—No 694,555. March 4, 1902. E. L. Laherty, Verdi, Nev. Nine-twentieths assigned to J. F. Condon of same place. This invention relates to detachable handles especially designed for crosscut saws. It consists of a sleeve or socket piece fixed and projecting at right angles from the handle, having a plate at the outer end approximately parallel with the handle and grooved at its front edge to receive and hold the end of the saw blade. An oval hole is made through the sleeve and a split bolt passes through the hole having a pin projecting from one-half and a corresponding socket in the other. The rear end of the bolt is screw-threaded and provided with a thumb nut by which it may be drawn back and the edge of the saw locked in the grooved face. The oval shape of the bolt hole allows the elastic sides of the split bolt to separate when they lie in the direction of the longest diameter of the hole, the pin is then withdrawn from its socket and the saw can be introduced or removed. When the saw is in the proper relative position to the handle the pin is turned at right angles or so that the separated sides correspond with the shortest diameter of the oval opening, and this forces them together and engages the pin with the hole in the saw so that when the nut is turned the saw will be firmly locked in place.

SITUATIONS WANTED.

AN EXPERIENCED ASSAYER AND CHEMIST is open to an engagement. Excellent references given. Address A. W., care of this office.

MINING ENGINEER, with many years experience as manager and superintendent, is open for an engagement. Is at present engaged as superintendent of a large copper mine. Address Engineer, care Mining and Scientific Press.

AN ALL-ROUND PRACTICAL MINER, TIMBERMAN and Tool Sharpener wants position as Foreman; also good Surveyor. Twenty-two years' experience. Successful in handling men. Regular habits. Can earn my pay. Address L. A. P., this office.

MINING ENGINEER, practical miner and mill man, assayer, etc., desires position of superintendent or assistant manager of a big property. Eleven years' experience. Best references. Now working in southern California. Address A. M. P., care of Mining and Scientific Press.

WANTED.—Position as superintendent of quartz mine. Worked as miner, engineer, mill man and superintendent. Superintendent at present. Would engage for foreign service. References given. Address Economy, this office.

WANTED.—POSITION AS MILL SUPERINtendent or Foreman. Understand concentration, amalgamation, cyanidiog and assaying. Seventeen years' experience. Address "Mill Foreman," care of Mining and Scientific Press.

WANTED.—POSITION AS ASSAYER, SURveyor, or Assistant Superintendent by technical graduate; three years' experience in mines of California and Colorado. Address I. E. D., care of Mining and Scientific Press office.

WANTED.—SITUATION AFTER MARCH 15, 1902, as Manager or Superintendent of mine. Have had five years' experience in manufacturing and constructing mining machinery and plants. Three years' experience in underground work. Four years' experience as manager and superintendent. Treatment of low grade ores a specialty. Practical in every detail. State location of mine and salary. Best of references. Address X. Y. Z., this office.

OPEN FOR ENGAGEMENT, A MINING AND Metallurgical Engineer. Eleven years' experience as Consulting Engineer and Manager. Graduated from the best technical schools in Europe. Specialty: examination and management of gold and silver properties. Location must be in California, Arizona or Nevada. Salary $5000 per year. Address C. A., care Mining and Scientific Press.

WANTED.

CAPITAL WANTED.—I am in a position to secure a valuable quartz proposition (gold). Can get a good working bond on same. Will give best of reference as to character and ability. W. B. GRANT, Tuttletown, Tuolumne Co., Cal.

WANTED—A Second-Hand Concentrator in first-class order, delivered to railroad. Give description and cash price.

Address N. S. TROWBRIDGE, 2133 Parker St., Berkeley, Cal.

FOR SALE.

FOR SALE—80 Acres of Mining Land on Squaw Creek, in Backbone Mining District, Shasta Co. Cal. Quartz Claims on Land.

Address Room 28, No. 401 California Street, San Francisco, Cal.

FOR SALE.—A well-established assay office and laboratory doing an excellent business, located in an interior town and within a few hours of the Mother Lode mines. Must be sold by Mar. 1. Best of reasons for selling. Address Wiest-Stradley Process Co., No. 39 N. American St., Stockton, Cal.

FOR SALE.—Cyanide plant and lease on 30,000 tons tailings; 10,000 tons average $6.24, 70% of which is gold. Reason for selling: business of greater importance. Address Box 99, Steeple Rock, Grant Co., New Mexico.

QUARTZ AND PLACER PROPERTIES in Siskiyou Co., Cal., for Sale.

Collections attended to. B. K. COLLIER, Attorney-at-Law, Etna Mills, Cal.

FOR SALE.

A first-class 125 horse power Atlas-Corliss engine with a 10-ft. fly wheel, 10 in. face; 50 ft. 3½ in. shaft log with drums, belts, etc. Also a 44 3½ in. tube horizontal boiler with smoke stack and all attachments complete. All in good order and only in use for about a year. Inquire of

ASSESSMENT NOTICES.

ROSS VALLEY LAND COMPANY.—Location of principal place of business, San Francisco, Cal.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 13th day of February, 1902, an assessment of seven dollars and fifty cents ($7 50) per share was levied upon the capital stock of the corporation, payable immediately to Charles P. Eells, the secretary of said corporation, at room 211, in the Crocker building, at the corner of Post and Market streets, in the city and county of San Francisco, state of California.

Any stock upon which this assessment shall remain unpaid on the 20th day of March, 1902 will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on the 5th day of April 1902, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

CHARLES P. EELLS,
Secretary Ross Valley Land Company.
Room 211, Crocker building, San Francisco, California.

GARIBALDI MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 5th day of February, 1902, an assessment (No. 2) of one and one-half cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 15 Nevada Block, 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of March, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 7th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

WILLIAM McPHERSON, Secretary.

Office—Room 15 Nevada Block, 309 Montgomery street, San Francisco, California.

TANANA MINING COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 4th day of March, 1902, an assessment (No. 5) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 405 Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 29th day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.
Office—405 Claus Spreckels Building, San Francisco, California.

LITTLE STANDARD OIL COMPANY.—Location of principal place of business, San Francisco, California; location of works, McKittrick District, Kern County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 4th day of March, 1902, an assessment (No. 3) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 40, Chronicle Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of April, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 12th day of May, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.
Office—Room 40, Chronicle Building, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco. California; location of works, Placer County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 25th day of February, 1902, an assessment (No. 34) of one-half (½) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of March, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of April, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.
Office—Room 31, 214 Pine street, San Francisco, California.

MINING AND SCIENTIFIC PRESS.

Whole No. 2174.—VOLUME LXXXIV. Number 12. SAN FRANCISCO, CAL., SATURDAY, MARCH 22, 1902. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Is Overproduction of Gold Possible?

Students of statistics, noting the rapid increase of annual gold production of the world during the last ten years, and noting also an ever-widening field for the mining of it, have been seriously debating among themselves the possibility of an overproduction. The practical miner, actively engaged in getting out all he can for himself now, is giving himself little concern about his successor's gold production and what he has to do with it when he gets too much. There is a novelty about the conception of the idea of an overproduction of gold that makes it a fascinating subject of discussion. No miner has ever been able to realize that his mine ever made an overproduction for him, and, it might be added, every miner wants for himself the mines that will make such an overproduction.

Seriously considered, the subject has little more than an academic interest at present, and, despite predictions of the professors, does not look possible of becoming of economic interest. It is true that gold is now mined from what was the wastes of mining twenty years ago. Refinements of practice are continually reducing even these small wastes made. The machine cheapening of work has made possible the extension of gold mining to enormous masses of rocks which can now be considered as being low-grade ores. New regions of the earth are being found gold-bearing and are being exploited with a tremendous application of energy. This is one view of the proposition.

The other view shows that gold mines do become worked out. The new sources of production in large part simply replace a source of production disappearing toward the vanishing point. The recovery of gold from the old wastes of gold mining makes more impression on the imagination, and less on the pocket, than the gold mining of the deposits from which the wastes were made. California in forty years up to 1890 yielded more than $1,000,000,000 of gold from her placers. Does anyone reasonably assume that from the wastes of those placers another $1,000,000,000 is coming in forty years, or even in several times forty years? The same reasoning applies to its quartz gold production. The wastes of the old workings will add to future production, but they cannot be expected to duplicate the quantity of the old or the concentration of its production in an equal time period.

The machine cheapening of mining work extending the field of gold mining to the low-grade ores again appeals more to the eye and imagination, and less to the pocket, than the past working in the high-grade ores. A flat dotted over with dredgers makes a great show, and is recovering gold that the old mining methods and machines could not touch, but the aggregate annual gold recovery of the flock of dredgers working in the low-grade gravel flats is less than that of one of the old time drift or hydraulic mines in a rich channel placer. The stamp mill of 100 heads working on mountain-like masses of low-grade ore is impressive, but it does not necessarily mean more gold than one of the old time 10-stamp mills working in bonanza ore.

It is beyond question that we can see more gold in place available for ultimate recovery than at any previous period of the world's history. The seeing of it now, however, is only one element in the problem of future gold production. Another element is time. Taking account of the time that it will require to get this gold out of the rocks, and its rate of production and the total mass of gold we estimate, is rather an abstraction than an economic factor.

Another factor in the equation is the fact that just as the quantity of gold coming out of the earth increases, so does the stream returning it to the earth again increase. With the increase of population of the world, and of the extension of its arts, more and more gold is consumed as a use instead of accumulating as a measure. As a use it is being buried again almost as fast as it is being dug up. As a use, too, it is quite within reason to assume that what might be an overproduction of a measure merely will be absorbed by a geometrically expanding consumption.

Even as a measure, the common interchangeable thing for all man's desires, the service required of gold would appear to be a quantity increasing in geometrical ratio. The aggregate of wealth, with all the devices invented for simplifying and quickening exchanges, is becoming so vast that enormous increases in gold production are absorbable as money without increasing values suddenly, which is the only way by which an overproduction of gold would become appreciatable. The overproduction of gold is, anyway, not a question for miners. It would seem rather one for the consideration of astronomers.

Ward & Hall Placer Claim, Spruce Creek, Atlin, B. C.

Muirhead Bro.'s Placer Claim, Spruce Creek, Atlin, B. C.

Atlin, B. C., Placer Mining.

The illustrations on this page are typical placer mining scenes in Atlin, B. C., mining district. So far as there is anything distinctive or specially characteristic of a locality about them, they could be referred to as illustrating typical placer mining scenes in California or Oregon. The appliances and methods shown are exactly alike. The sluice boxes, derrick, water wheels, bedrock cuts, miners' cabins and tents and the background of rounded tree-clad hills illustrate a similarity of conditions that is suggestive of the common likeness of placer mines everywhere.

Atlin placer mining has had some setbacks from causes now removed. The deposits, while extensive, do not average as rich as those in the Klondike. The climatic conditions are, however, more favorable to mining operations and to the use of cheap hydraulic methods. The last two years have witnessed consolidations of many of the small individual location claims, that would be worked in the manner illustrated, into large groups, for which extensive ditch and hydraulic constructions and installations have been made. Some of these have been far enough along to test for commercial results which have been highly satisfactory. A number of others are still in construction and installation stages. The district as a whole has at this time by far the larger amount of hydraulic mining installations made in the far North, and it is believed the results of working will show lower costs than can be obtained in other northern districts.

The Auditing of a Mining Company's Accounts.*

NUMBER II.—CONCLUDED.

By CHARLES V. JENKINS.

CAPITAL.—Capital expenditure accounts are debited with all disbursements which result in the acquirement of something of permanent value.

Such entries require very careful inspection, not merely to prove clerical accuracy in recording the transactions, and the vouchers and receipts covering them, but also the legitimacy of their classification as capital expenditures. A systematic investigation of the amounts carried to capital, and of all entries of amounts expended and covered into the accounts of buildings, plants, machinery, equipment, air-pipe lines, water mains, etc., etc., should afford an approximate verification of the correctness of these property accounts, and put to proof the fairness of the valuation of the several plants carried as assets.

These accounts should be also scrutinized, to see that they are duly credited with amounts written off, from time to time, for depreciation. Such amounts, taken out of income for the deterioration of plant, are usually debited to profit-and-loss direct, but are sometimes carried by a charge to a depreciation account.

A close discrimination between expenses properly chargeable to capital and to revenue, respectively, is of vital importance; for it is apparent that if too great a portion of the expense of any year be charged against capital, then the current expenses will appear smaller and the profit correspondingly greater. On the other hand, if the entire cost of plant and equipment, or of improvements, which, for all practical purposes, may be considered of permanent value, is charged against the operating expense or cost of mining of any year, a true profit with respect to the ordinary working expenses and receipts may be made to appear as a loss. If the whole, or any portion, of the development work of a mine for any year be charged to capital and the current operating expense be relieved of this cost, the apparent profit will he unduly increased.

In the business of mining, custom has not yet established a uniform method of treating expenditures for renewals and repairs of machinery, plant and equipment. In fact, the question of distinguishing between capital and revenue for sums expended in the original purchase, enlargements and improvements of plants is a matter of individual concern and choice. Some companies treat every expenditure for machinery and equipment as fairly chargeable to the cost of mining for the year during which the purchase was made. Practically, this method may he said to he correct; since the sums so expended are part of the expense of mining, and must eventually he repaid hy the revenue derived from the sale of the mine's product. Other companies are too prone to treat as capital not only the original purchase price, hut all sums expended for improvements, and for renewals and repairs as well. And some companies do, while others do not, make provision for depreciation. In any event, an examination of the accounts should prove that the aggregate amount appearing in capital accounts as expended for machinery, equipment, etc., is represented hy plant of that value, maintained in efficient repair.

As stated, an approximate verification of these amounts can be arrived at by tracing from their source all entries for items so charged. For example, in case a mining plant is purchased and erected under contract, it is easy to determine its original value hy reference to the contract. The erection of plants, the installing of machinery, etc., when done by a company by day's labor, involve a careful consideration of the cost of labor, as well as of material and supplies.

It must he confessed that the wages account is the most difficult of all to check effectually, especially in trying to distinguish between capital and revenue expenditures, when mining operations and construction are carried on simultaneously, and more especially when a company has no system of keeping and correctly recording amounts expended for wages. Where such a system exists, and where the records of one department are examined and checked by another and independent department, it will not he so troublesome to arrive at a comparatively accurate proving of the correctness of all wages charged to capital.

REVENUE.—In a mining enterprise of any magnitude the debit side of this account represents the expenditure of considerable money. An audit to determine the actual amount, and the correctness of the entries of expenditure of revenue must be very comprehensive.

The vouchers and receipts, in addition to the checking on the cash hook, must he critically inspected, and the classification and distribution of the expense represented by each voucher must be verified.

Mining supplies purchased are charged to revenue when used, not necessarily when paid for. This requires an exhaustive investigation into the nature and conduct of the stores accounts, and a complete checking of these accounts, to make sure that all supplies taken from stores are properly charged, when credited to the stores account. The entries covering these transactions should be gone into pretty thoroughly. The prices charged for supplies consumed should be compared with the purchase price and the cost as stated in inventory. An inventory ought to be taken of all material and supplies on hand, the values being compared with the purchase prices, and the total with the aggregate of the various stores accounts on the books.

Wages, salaries, and all fixed and general expenses, such as taxes, insurance, etc., are direct cash disbursements. All these items, with the possible exception of wages, can he effectually tested by comparing with the vouchers, and hy reference, when necessary, to the authority for the payment. As, for instance, the correctness of salaries paid could he ascertained from the directors who had the fixing of salaries; taxes, hy comparing the payments with the demands of the Government, etc.

In the matter of wages it is impracticable to verify all the items on the payrolls which go to make up the aggregate expenditure for labor. The distribution and legitimate "expensing" of the cost of labor can be fairly tested as explained; but an auditor may be obliged to rely to a considerable extent upon the system of inter-staff corroboration referred to above, and upon the certificate of an official in authority, as to the veracity of the various payrolls.

If all accounts representing the operating, fixed and general expenses of the business are carried into one account, "Costs of Mining," at regular intervals, a comparison of the entries in this account with the mining costs book will facilitate a verification of the aggregate expenditure chargeable to revenue.

PERSONAL ACCOUNTS.—Personal accounts, accounts and bills receivable, and accounts and bills payable, should be examined carefully. In the business of mining, accounts of this nature are not frequent, and liability of loss from bad debts or doubtful accounts is limited. Such accounts and the contingency of such loss, however, should be considered. The amount of accounts due and bills payable, as shown on the books, should be verified and taken into calculation in determining the gains or losses for the period under audit.

FINANCIAL STATEMENT.—The task of checking and verifying all book transactions being completed, the footings of all accounts in the ledger, whether closed or still operative, should be tested, balances verified, and a trial balance taken. The trial balance proving the correctness of the ledger, it is now in order to prepare a statement of assets and liabilities, and a statement of profit and loss.

The financial condition of the company should be very clearly set forth in this financial statement, the balance sheet exhibiting:

PROPERTY AND ASSETS.	CAPITAL AND LIABILITIES.
1—PROPERTY, showing mines and mineral claims, and other real property.	1—CAPITAL STOCK, showing in detail the number of shares; amount paid up; amount, if any, remaining unpaid; amount and nature of arrear of calls, particulars of forfeited shares, etc.
2—IMPROVEMENTS, showing buildings, machinery, plants, equipment, etc.; also stores and supplies on hand.	2—DEBTS AND LIABILITIES of the company, showing the amount of debts owed by the company, enumerating the same, and distinguishing actual from contingent liabilities, etc. These contingent liabilities, such as claims against the company not acknowledged as debts, or moneys for which the company is contingently liable, should be stated; but only the amount of acknowledged debt is carried out as a liability.
3—CASH AND INVESTMENTS, showing amount of cash on hand and in bank, the nature of investments, rates of interest, etc.	3—RESERVE FUND, showing the amount set aside from profits to meet contingencies.
4—DEBTS OWING TO THE COMPANY, showing all debts, accounts and bills receivable.	4—PROFIT AND LOSS, showing the disposable balance for payment of dividends, etc.

The statement of profit and loss should state specifically upon what accounts losses have been sustained, and detail the accounts through which profits have been realized. In calculating the gains and losses, it must be borne in mind that the loss or gain of a mining venture for any given period is not merely the difference between the receipts for ores sold and the cost of mining. Depreciation must always be taken into consideration.

REDEMPTION OF CAPITAL.—In connection with an audit it is essential that the questions of depreciation, dividends, surplus and redemption of capital be taken into account. Most industrial enterprises involve the same elementary principles. But there are considerations in mining which do not affect other kinds of business.

A mine cannot be said to be a permanent source of wealth. Every ton of ore mined and marketed involves a depreciation in the value of the property which cannot be repaired. Hence, during the life of a mine, not only must interest be realized upon the capital invested, but the capital itself must he recovered, if the venture is to prove successful. In this respect, depreciation and dividends may be considered as different causes operating to the same end, namely, the diminution of the value of the property.

DEPRECIATION.—Generally speaking, the loss upon assets which are diminishing in value is called depreciation. As applied to plants, equipment, mining machinery, etc. (provided the original cost of these items is not treated as a portion of the current operating expense, and so charged at time of purchase), a certain sum, estimated upon the life of the plant, should be charged against the gross revenue of each year, to replace the capital destroyed or reduced by wear and tear. The method of treating sums expended for plant as current expense is manifestly fair, both to the management desirous of making a record in the matter of mine costs and to the present stockholders; for, in the early stages of a mine, when most of the equipment is purchased, costs will be exaggerated, and dividends which might otherwise be paid may be deferred, by reason of this abnormal increase in the current expense account. But, since the life of mining machinery is comparatively short, and there is practically no residual value, in case the mine is abandoned as worked out, or the machinery has to be replaced by a plant of greater capacity, it is not only prudent hut absolutely necessary that some provision be made to redeem its cost.

Depreciation, as applied to the redemption of the capital invested in a mine, provides for the writing off of a certain sum each year, estimated upon the life of a mine, to accumulate a sinking fund for this purpose.

In the business of mining, however much may he said in favor of some method of accumulating a sinking fund, such a fund is seldom, if ever, provided for. The individual stockholder usually thinks that he would prefer to have his capital returned to him as fast as it may be taken from the mine, rather than await the accumulation of a fund sufficient to redeem the whole capital. To this end the custom prevails, and will probably be considered the better method, so far as mining is concerned, of repaying capital hy dividends. By means of dividends, or, as they might properly be called, enlarged dividends, the stockholder, after calculating a fair interest on his investment, can consider the sums received over and above this interest as repayments of the principal of his investment.

This method may be subject to some question, since there are few (except those who have given special thought to the matter) who properly appreciate the difference between a dividend which is purely a distribution of profits and a dividend which is intended to repay capital. Then there is this contingency to face: in the case of a successful mining enterprise it may transpire that the full amount of the company's capital is carried as a liability, when, in fact, it has all been repaid in the shape of dividends; while, on the other side of the balance sheet, the mine, valued at its original cost and worth, is still shown.

The amount paid in dividends in this way each year may be estimated, or rather will depend, upon the amount of output and the profit realized upon the sale of product.

DIVIDENDS.—The term dividend, as generally accepted, means a sum which a corporation sets aside from its profits to be divided among its members. It is a fundamental rule that dividends shall not be declared or paid when a company is insolvent, or the payment of which renders a company insolvent. A dividend must be declared from realized, and not from estimated, profits. The violation of this rule is not common. But it too frequently happens that when profit does not follow on the heels of promise the directors of a company, anxious to appease the importunity of stockholders, are led to ignore one of the most important precepts of financial prudence. Under this constraint they declare and pay dividends without first having provided a surplus or reserve fund; that is, a special fund of profits set aside for the purpose of meeting contingencies, or of equalizing dividends.

RESERVE FUND.—If such a fund, set apart from current income, or created hy withholding a small percentage of the annual net earnings, is shown upon the books, this account should be examined by the auditor, and its accuracy should be tested. The amount should be held, either in actual cash on hand, or on special deposit in bank, or invested in safe and readily convertible securities. A reserve fund once established should be drawn upon only in case of urgent necessity, or to meet exceptional and temporary reverses in profits.

The history of the mining industry is replete with records of companies wrecked hy adverse circumstances, hy reason of the lack of means with which

*Trans. American Institute of Mining Engineers, New York meeting, February, 1902.

to carry exploration to a probable successful issue—means which might have been provided at a time when the mine was earning regular profits. But with working capital exhausted; stockholders reluctant to pay assessments or to render themselves personally liable for borrowed capital; the ore reserves of the mine worked up to their limit, and no reserve fund to meet the exigency, the mine is abandoned. And thus is recorded another mining failure which a little forethought and business prudence might have averted.

Again, it may occur that a mine in the full flush of prosperity is compelled to discontinue dividends for a period. There would be fewer disappointed stockholders, in this respect, if the policy of providing a surplus were rigidly insisted upon. Regular dividends could be continued, and a most distressing period in the affairs of a mining company could be safely tided over if, during its most profitable period, provision had been made for such a crisis.

GENERAL REMARKS.—As has been observed, and will no doubt be confirmed by the experience of most mining engineers, there is a noticeable lack of uniformity in the systems of keeping mine accounts. Such irregularity in the matter of registering and recording the routine of business details at the mine may be attributed to arbitrary local conditions. But the absence of uniform system in the more important departments of accounting, especially in the treatment of expenditures and in respect to mine costs, must be ascribed, in part at least, to the scarcity of practical literature on the subject, and to lack of active discussion of the questions involved by those most vitally interested. In all other important productive industries, a considerable degree of conformity, not only in general system, but in details of shop organization, cost keeping, etc., has been established. This uniformity obtains, to a greater or less extent, even in manufacturing and mercantile pursuits, where processes and mechanical methods, locality, competition, and other conflicting influences, affect trade conditions.

It is not intended to insist pedantically upon similarity of forms, methods, and like details, nor is it deemed necessary, on the other hand, to formulate the reasons for a generally uniform practice with respect to mine accounts; but it may not be amiss to offer the opinion that in no other way can uniformity be secured except by concerted effort on the part of those who are actively interested in all that pertains to the economy of modern mining.

If, in connection with the many discussions relevant to the science and practice of mining, the business side of the question could receive the attention it deserves; if the interchange of ideas and opinions by those whose authority and interest are unquestioned were more frequent and general, reforms in this direction could be induced. By urging the adoption of a few conservative rules and principles of business which would tend to safeguard the commercial interests of mining, and by pressing the importance of a practicable uniformity in system and method, the engineering profession could increase the credit which it has already earned by what it has done to advance the business of mining from the plane of mere speculative gambling to its present high rank among the prosperous productive industries.

THE American Iron & Steel Association, on complete statistics received from the manufacturers, states that the total production of Bessemer steel ingots in 1901 was 8,713,302 gross tons. This production was by far the largest in the history of the country. Of the production last year 6764 tons were steel castings. The production of all kinds of Bessemer steel rails by the producers of Bessemer steel ingots in 1901 was 2,836,273 gross tons.

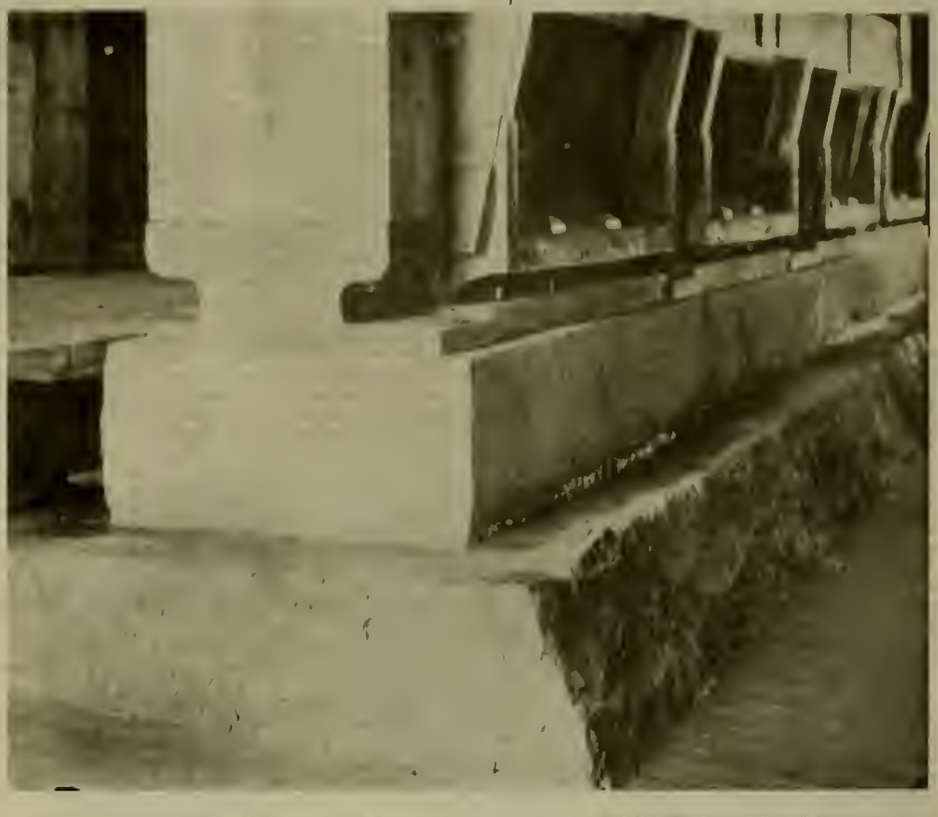
Foundations for Stamp Mill Mortars.

Written for the MINING AND SCIENTIFIC PRESS.

It seems to have been an almost universal practice to put a cushion of some kind under stamp mill mortars, and also to use wood blocks under this cushion, until the belief has become more or less firmly established, whereas correct theory would maintain that the mortars should be absolutely solid. No one thinks of putting a rubber or blanket cushion under an anvil. In a number of instances concrete foundations have been used with, in some cases, unfortunate results. In the Alaska-Treadwell mill cast iron blocks some 14 inches thick were used successfully, but these were expensive.

The 40-stamp mill which was erected at the Banner mine, near Oroville, Cal., some years ago, was provided with concrete bases for the stamp batteries. Two of the illustrations herewith are of this work during construction. The concrete mass was built in pyramidal form, 8 feet wide at the base. The bottom portion to a height of 3 feet was composed of one part of Portland cement, two parts of sharp quartz sand and five parts of broken rock. The cap portion, a foot deep, was made with a steadily diminishing proportion of the broken rock, and in the top 3 or 4 inches contains none at all. The foundation bolts for the mortars were set 33 inches deep in the concrete and extended 6 inches above the surface. The entire mass of the foundation was set on solid bedrock.

At the North Star mines, Grass Valley, Cal., some two years since, the old wood blocks with blanket cushions had become decayed and were taken out and a foundation built up of rough cement masonry, using rock from the dump. On top of this masonry were placed granite blocks about 16 inches thick, and on this granite the mortars, the anchor bolts extending down through the granite blocks to the anchor plates well down in the masonry. Castings were made to hold the battery posts, which were anchored to the masonry in the same way. The accompanying engraving will make the arrangement plainer than the description.



Concrete Base and Granite Foundations for Stamp Batteries, North Star Mill, Grass Valley, Cal.

Concrete Foundations for Stamp Batteries at Banner Mine, Oroville, Cal.

The mortars have now had over two years of service and are absolutely solid. The stamp stems do not break any more, if as much, as formerly, while the mill crushes more ore.

It may be worth mentioning, as a bit of experience gained, that when these mortars were first put up sheet lead $\frac{1}{32}$ of an inch thick was placed between the mortar and the granite, with the idea of its filling the interstices of the stone. It proved a mistake, however, and worked out, leaving the mortars loose. It was also found that years of pounding of the old mortars on a soft foundation had "dished" them

The Auditing of a Mining Company's Accounts.*

NUMBER II.—CONCLUDED.

By CHARLES V. JENKINS.

CAPITAL.—Capital expenditure accounts are debited with all disbursements which result in the acquirement of something of permanent value.

Such entries require very careful inspection, not merely to prove clerical accuracy in recording the transactions, and the vouchers and receipts covering them, hut also the legitimacy of their classification as capital expenditures. A systematic investigation of the amounts carried to capital, and of all entries of amounts expended and covered into the accounts of huildings, plants, machinery, equipment, air-pipe lines, water mains, etc., etc., should afford an approximate verification of the correctness of these property accounts, and put to proof the fairness of the valuation of the several plants carried as assets.

These accounts should be also scrutinized, to see that they are duly credited with amounts written off, from time to time, for depreciation. Such amounts, taken out of income for the deterioration of plant, are usually debited to profit-and-loss direct, but are sometimes carried by a charge to a depreciation account.

A close discrimination hetween expenses properly chargeable to capital and to revenue, respectively, is of vital importance; for it is apparent that if too great a portion of the expense of any year be charged against capital, then the current expenses will appear smaller and the profit correspondingly greater. On the other hand, if the entire cost of plant and equipment, or of improvements, which, for all practical purposes, may he considered of permanent value, is charged against the operating expense or cost of mining of any year, a true profit with respect to the ordinary working expenses and receipts may he made to appear as a loss. If the whole, or any portion, of the development work of a mine for any year he charged to capital and the current operating expense he relieved of this cost, the apparent profit will he unduly increased.

In the business of mining, custom has not yet established a uniform method of treating expenditures for renewals and repairs of machinery, plant and equipment. In fact, the question of distinguishing between capital and revenue for sums expended in the original purchase, enlargements and improvements of plants is a matter of individual concern and choice. Some companies treat every expenditure for machinery and equipment as fairly chargeahle to the cost of mining for the year during which the purchase was made. Practically, this method may he said to he correct; since the sums so expended are part of the expense of mining, and must eventually he repaid by the revenue derived from the sale of the mine's product. Other companies are too prone to treat as capital not only the original purchase price, hut all sums expended for improvements, and for renewals and repairs as well. And some companies do, while others do not, make provision for depreciation. In any event, an examination of the accounts should prove that the aggregate amount appearing in capital accounts as expended for machinery, equipment, etc., is represented hy plant of that value, maintained in efficient repair.

As stated, an approximate verification of these amounts can be arrived at hy tracing from their source all entries for items so charged. For example, in case a mining plant is purchased and erected under contract, it is easy to determine its original value hy reference to the contract. The erection of plants, the installing of machinery, etc., when done by a company hy day's labor, involve a careful consideration of the cost of lahor, as well as of material and supplies.

It must be confessed that the wages account is the most difficult of all to check effectually, especially in trying to distinguish hetween capital and revenue expenditures, when mining operations and construction are carried on simultaneously, and more especially when a company has no system of keeping and correctly recording amounts expended for wages. Where such a system exists, and where the records of one department are examined and checked by another and independent department, it will not he so troublesome to arrive at a comparatively accurate proving of the correctness of all wages charged to capital.

REVENUE.—In a mining enterprise of any magnitude the debit side of this account represents the expenditure of considerahle money. An audit to determine the actual amount, and the correctness of the entries of expenditure of revenue must he very comprehensive.

The vouchers and receipts, in addition to the checking on the cash book, must he critically inspected, and the classification and distribution of the expense represented hy each voucher must he verified.

Mining supplies purchased are charged to revenue when used, not necessarily when paid for. This requires an exhaustive investigation into the nature and conduct of the stores accounts, and a complete checking of these accounts, to make sure that all supplies taken from stores are properly charged, when credited to the stores account. The entries covering these transactions should he gone into pretty thoroughly. The prices charged for supplies consumed should be compared with the purchase price and the cost as stated in inventory. An inventory ought to he taken of all material and supplies on hand, the values heing compared with the purchase prices, and the total with the aggregate of the various stores accounts on the books.

Wages, salaries, and all fixed and general expenses, such as taxes, insurance, etc., are direct cash disbursements. All these items, with the possihle exception of wages, can he effectually tested hy comparing with the vouchers, and hy reference, when necessary, to the authority for the payment. As, for instance, the correctness of salaries paid could he ascertained from the directors who had the fixing of salaries; taxes, by comparing the payments with the demands of the Government, etc.

In the matter of wages it is impracticable to verify all the items on the payrolls which go to make up the aggregate expenditure for labor. The distribution and legitimate "expensing" of the cost of lahor can be fairly tested as explained; hut an auditor may be obliged to rely to a considerable extent upon the system of inter-staff corrohoration referred to above, and upon the certificate of an official in authority, as to the veracity of the various payrolls.

If all accounts representing the operating, fixed and general expenses of the business are carried into one account, "Costs of Mining," at regular intervals, a comparison of the entries in this account with the mining costs hook will facilitate a verification of the aggregate expenditure chargeahle to revenue.

PERSONAL ACCOUNTS.—Personal accounts, accounts and hills receivable, and accounts and hills payable, should he examined carefully. In the business of mining, accounts of this nature are not frequent, and liahility of loss from bad debts or douhtful accounts is limited. Such accounts and the contingency of such loss, however, should he considered. The amount of accounts due and hills payable, as shown on the hooks, should be verified and taken into calculation in determining the gains or losses for the period under audit.

FINANCIAL STATEMENT.—The task of checking and verifying all hook transactions being completed, the footings of all accounts in the ledger, whether closed or still operative, should he tested, halances verified, and a trial balance taken. The trial halance proving the correctness of the ledger, it is now in order to prepare a statement of assets and liabilities, and a statement of profit and loss.

The financial condition of the company should he very clearly set forth in this financial statement, the halance sheet exhibiting:

PROPERTY AND ASSETS.	CAPITAL AND LIABILITIES.
1—PROPERTY, showing mines and mineral claims, and other real property.	1—CAPITAL STOCK, showing in detail the number of shares; amount paid up; amount, if any, remaining unpaid; amount and nature of arrear of calls, particulars of forfeited shares, etc.
2—IMPROVEMENTS, showing buildings, machinery, plants, equipment, etc.; also stores and supplies on hand.	2—DEBTS AND LIABILITIES of the company, showing the amount of debts owed by the company, enumerating the same, and distinguishing actual from contingent liabilities, etc. These contingent liabilities, such as claims against the company not acknowledged as debts, or moneys for which the company is contingently liable, should be stated; but only the amount of acknowledged debt is carried out as a liability.
3—CASH AND INVESTMENTS, showing amount of cash on hand and in bank, the nature of investments, rates of interest, etc.	3—RESERVE FUND, showing the amount set aside from profits to meet contingencies.
4—DEBTS OWING TO THE COMPANY, showing all debts, accounts and bills receivable.	4—PROFIT AND LOSS, showing the disposable balance for payment of dividends, etc.

The statement of profit and loss should state specifically upon what accounts losses have heen sustained, and detail the accounts through which profits have been realized. In calculating the gains and losses, it must be horne in mind that the loss or gain of a mining venture for any given period is not merely the difference hetween the receipts for ores sold and the cost of mining. Depreciation must always he taken into consideration.

REDEMPTION OF CAPITAL.—In connection with an audit it is essential that the questions of depreciation, dividends, surplus and redemption of capital he taken into account. Most industrial enterprises involve the same elementary principles. But there are considerations in mining which do not affect other kinds of business.

A mine cannot be said to be a permanent source of wealth. Every ton of ore mined and marketed involves a depreciation in the value of the property which cannot he repaired. Hence, during the life of a mine, not only must interest be realized upon the capital invested, hut the capital itself must he recovered, if the venture is to prove successful. In this respect, depreciation and dividends may he considered as different causes operating to the same end, namely, the diminution of the value of the property.

DEPRECIATION.—Generally speaking, the loss upon assets which are diminishing in value is called depreciation. As applied to plants, equipment, mining machinery, etc. (provided the original cost of these items is not treated as a portion of the current operating expense, and so charged at time of purchase), a certain sum, estimated upon the life of the plant, should be charged against the gross revenue of each year, to replace the capital destroyed or reduced by wear and tear. The method of treating sums expended for plant as current expense is manifestly fair, both to the management desirous of making a record in the matter of mine costs and to the present stockholders; for, in the early stages of a mine, when most of the equipment is purchased, costs will he exaggerated, and dividends which might otherwise he paid may he deferred, hy reason of this abnormal increase in the current expense account. But, since the life of mining machinery is comparatively short, and there is practically no residual value, in case the mine is abandoned as worked out, or the machinery has to he replaced hy a plant of greater capacity, it is not only prudent hut absolutely necessary that some provision he made to redeem its cost.

Depreciation, as applied to the redemption of the capital invested in a mine, provides for the writing off of a certain sum each year, estimated upon the life of a mine, to accumulate a sinking fund for this purpose.

In the business of mining, however much may be said in favor of some method of accumulating a sinking fund, such a fund is seldom, if ever, provided for. The individual stockholder usually thinks that he would prefer to have his capital returned to him as fast as it may he taken from the mine, rather than await the accumulation of a fund sufficient to redeem the whole capital. To this end the custom prevails, and will probably be considered the hetter method, so far as mining is concerned, of repaying capital hy dividends. By means of dividends, or, as they might properly he called, enlarged dividends, the stockholder, after calculating a fair interest on his investment, can consider the sums received over and ahove this interest as repayments of the principal of his investment.

This method may he suhject to some question, since there are few (except those who have given special thought to the matter) who properly appreciate the difference between a dividend which is purely a distribution of profits and a dividend which is intended to repay capital. Then there is this contingency to face: in the case of a successful mining enterprise it may transpire that the full amount of the company's capital is carried as a liahility, when, in fact, it has all heen repaid in the shape of dividends; while, on the other side of the halance sheet, the mine, valued at its original cost and worth, is still shown.

The amount paid in dividends in this way each year may he estimated, or rather will depend, upon the amount of output and the profit realized upon the sale of product.

DIVIDENDS.—The term dividend, as generally accepted, means a sum which a corporation sets aside from its profits to he divided among its members. It is a fundamental rule that dividends shall not he declared or paid when a company is insolvent, or the payment of which renders a company insolvent. A dividend must be declared from realized, and not from estimated, profits. The violation of this rule is not common. But it too frequently happens that when profit does not follow on the heels of promise the directors of a company, anxious to appease the importunity of stockholders, are led to ignore one of the most important precepts of financial prudence. Under this constraint they declare and pay dividends without first having provided a surplus or reserve fund; that is, a special fund of profits set aside for the purpose of meeting contingencies, or of equalizing dividends.

RESERVE FUND.—If such a fund, set apart from current income, or created hy withholding a small percentage of the annual net earnings, is shown upon the hooks, this account should be examined hy the auditor, and its accuracy should he tested. The amount should he held, either in actual cash on hand, or on special deposit in hank, or invested in safe and readily convertible securities. A reserve fund once established should he drawn upon only in case of urgent necessity, or to meet exceptional and temporary reverses in profits.

The history of the mining industry is replete with records of companies wrecked by adverse circumstances, by reason of the lack of means with which

*Trans. American Institute of Mining Engineers, New York meeting, February, 1902.

to carry exploration to a probable successful issue—means which might have been provided at a time when the mine was earning regular profits. But with working capital exhausted; stockholders reluctant to pay assessments or to render themselves personally liable for borrowed capital; the ore reserves of the mine worked up to their limit, and no reserve fund to meet the exigency, the mine is abandoned. And thus is recorded another mining failure which a little forethought and business prudence might have averted.

Again, it may occur that a mine in the full flush of prosperity is compelled to discontinue dividends for a period. There would be fewer disappointed stockholders, in this respect, if the policy of providing a surplus were rigidly insisted upon. Regular dividends could be continued, and a most distressing period in the affairs of a mining company could be safely tided over if, during its most profitable period, provision had been made for such a crisis.

GENERAL REMARKS.—As has been observed, and will no doubt be confirmed by the experience of most mining engineers, there is a noticeable lack of uniformity in the systems of keeping mine accounts. Such irregularity in the matter of registering and recording the routine of business details at the mine may be attributed to arbitrary local conditions. But the absence of uniform system in the more important departments of accounting, especially in the treatment of expenditures and in respect to mine costs, must be ascribed, in part at least, to the scarcity of practical literature on the subject, and to lack of active discussion of the questions involved by those most vitally interested. In all other important productive industries, a considerable degree of conformity, not only in general system, but in details of shop organization, cost keeping, etc., has been established. This uniformity obtains, to a greater or less extent, even in manufacturing and mercantile pursuits, where processes and mechanical methods, locality, competition, and other conflicting influences, affect trade conditions.

It is not intended to insist pedantically upon similarity of forms, methods, and like details, nor is it deemed necessary, on the other hand, to formulate the reasons for a generally uniform practice with respect to mine accounts; but it may not be amiss to offer the opinion that in no other way can uniformity be secured except by concerted effort on the part of those who are actively interested in all that pertains to the economy of modern mining.

If, in connection with the many discussions relevant to the science and practice of mining, the business side of the question could receive the attention it deserves; if the interchange of ideas and opinions by those whose authority and interest are unquestioned were more frequent and general, reforms in this direction could be induced. By urging the adoption of a few conservative rules and principles of business which would tend to safeguard the commercial interests of mining, and by pressing the importance of a practicable uniformity in system and method, the engineering profession could increase the credit which it has already earned by what it has done to advance the business of mining from the plane of mere speculative gambling to its present high rank among the prosperous productive industries.

THE American Iron & Steel Association, on complete statistics received from the manufacturers, states that the total production of Bessemer steel ingots in 1901 was 8,713,302 gross tons. This production was by far the largest in the history of the country. Of the production last year 6764 tons were steel castings. The production of all kinds of Bessemer steel rails by the producers of Bessemer steel ingots in 1901 was 2,836,273 gross tons.

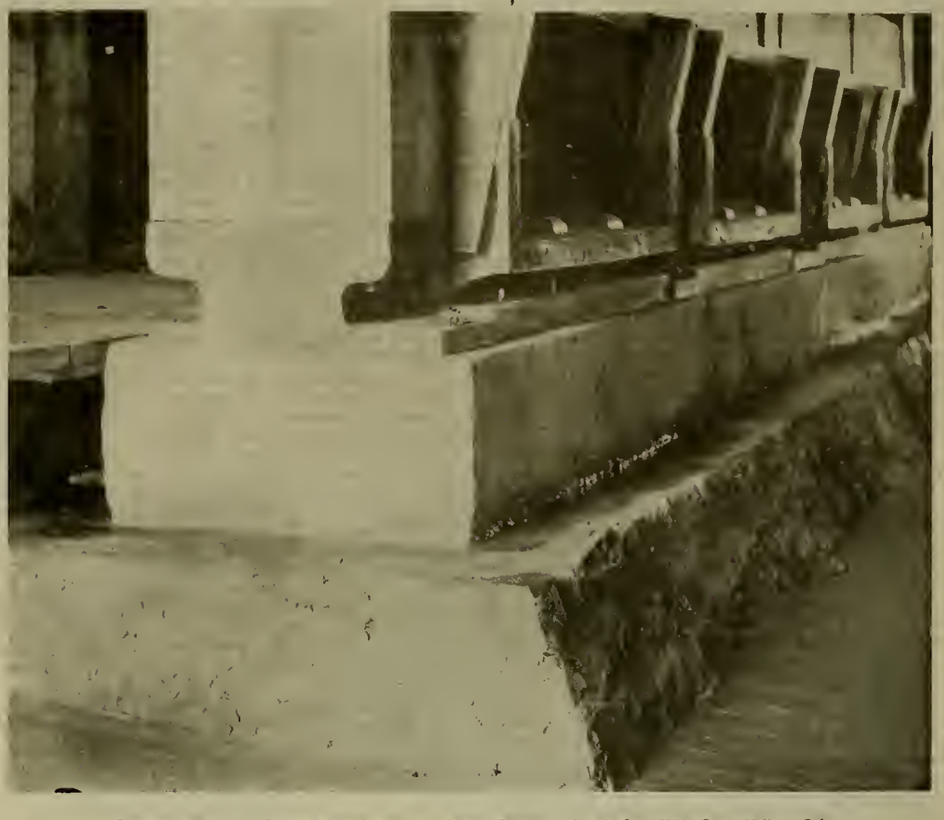
Foundations for Stamp Mill Mortars.

Written for the MINING AND SCIENTIFIC PRESS.

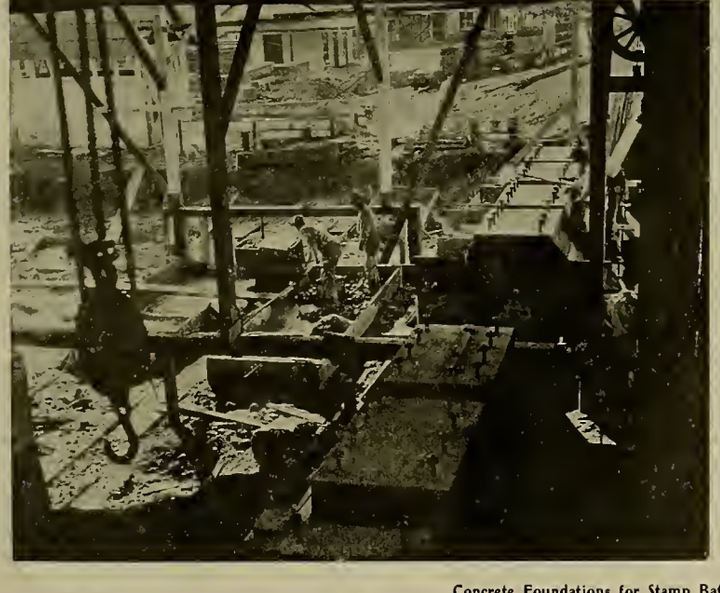
It seems to have been an almost universal practice to put a cushion of some kind under stamp mill mortars, and also to use wood blocks under this cushion, until the relief has become more or less firmly established, whereas correct theory would maintain that the mortars should be absolutely solid. No one thinks of putting a rubber or blanket cushion under an anvil. In a number of instances concrete foundations have been used with, in some cases, unfortunate results. In the Alaska-Treadwell mill cast iron blocks some 14 inches thick were used successfully, but these were expensive.

The 40-stamp mill which was erected at the Banner mine, near Oroville, Cal., some years ago, was provided with concrete bases for the stamp batteries. Two of the illustrations herewith are of this work during construction. The concrete mass was built in pyramidal form, 8 feet wide at the base. The bottom portion to a height of 3 feet was composed of one part of Portland cement, two parts of sharp quartz sand and five parts of broken rock. The cap portion, a foot deep, was made with a steadily diminishing proportion of the broken rock, and in the top 3 or 4 inches contains none at all. The foundation bolts for the mortars were set 33 inches deep in the concrete and extended 6 inches above the surface. The entire mass of the foundation was set on solid bedrock.

At the North Star mines, Grass Valley, Cal., some two years since, the old wood blocks with blanket cushions had become decayed and were taken out and a foundation built up of rough cement masonry, using rock from the dump. On top of this masonry were placed granite blocks about 16 inches thick, and on this granite the mortars, the anchor bolts extending down through the granite blocks to the anchor plates well down in the masonry. Castings were made to hold the battery posts, which were anchored to the masonry in the same way. The accompanying engraving will make the arrangement plainer than the description.



Concrete Base and Granite Foundations for Stamp Batteries, North Star Mill, Grass Valley, Cal.



Concrete Foundations for Stamp Batteries at Banner Mine, Oroville, Cal.

The mortars have now had over two years of service and are absolutely solid. The stamp stems do not break any more, if as much, as formerly, while the mill crushes more ore.

It may be worth mentioning, as a bit of experience gained, that when these mortars were first put up sheet lead $\frac{1}{32}$ of an inch thick was placed between the mortar and the granite, with the idea of its filling the interstices of the stone. It proved a mistake, however, and worked out, leaving the mortars loose. It was also found that years of pounding of the old mortars on a soft foundation had "dished" them

somewhat, though they had heen planed when made. It was, therefore, necessary to remove the mortars and cut the granite surface slightly concave, after which there was no more trouhle.

Three Prospectors' Yarns.

Written for the MINING AND SCIENTIFIC PRESS.

We have come together once more, and each is seated in his favorite chair before the open fire of the cahin. There is strength in union, and, let me confess, each thought the other had made a strike during his three months of prospecting, and with a glad heart he returned to the Pizen Dog claim of the Salmon mountains to share and enjoy it. "Hope springs eternal in the miner's hosom," and the reader who remembers our efforts to cyanide ore in place [published in the MINING AND SCIENTIFIC PRESS, Feh. 2, 1901] will recognize our party. Old Joe, the sometime Heidelherg student of metallurgy; Manuel, the Portuguese cook and man of all work, with an unsatisfied thirst, and the other fellow.

We spent the evening describing our prospects and traces. The next day was devoted to getting Joe's muffle furnace into shape for assaying, bucking samples and cleaning up the cahin, preparatory to "holing up" for the long winter.

"By the way, Manuel, where did you leave Quo Vadis?"

"Oh, that a mule? Mebbe he come hye an' hye."

We hoth looked at our cook, and he, evidently having expected the question, deliberately seated himself upon a powder box and settled himself for the inquest. In his unwritahle English he hegan:

"I left that mule helly deep in the river. He was ahout half way over, and I packed the duffle to the shore. Yes, I had to swim some, and everything was wet. It was then I decided to return to camp; but I left the mule in the river. Mayhe he is there yet; I don't know. He was there when I came away."

"What? Drowned?"

"Oh, no; that mule he just stand there like a rock; hut it wasn't the mule that stood there—what you call halk—but a worse one than the mule. Mayhe I had hetter tell you all ahout it. You know that mule I ride very well sometimes. Every morning when I start he hucks me off; hut I lick him pretty hard, and he is a good mule to ride then; but never could I put a pack on him. He hucked everything off, and then kicked the packsaddle to pieces. This made me very sad, for I liked that mule. One day I rode down a trail and came to a camp. The man came from Callahan. You know the kind of native. He knew everything in the world, for he once saw the cars go hy at Gazelle. He told me all he knew in ahout an hour; but he told it over several times that night, till I went to sleep. In the morning he said: 'That mule of yours is not much good, is he? So how will you swap him for my fine horse? My fine Callahan horse is too good to pack, hut I will trade him even for your poor old mule.' I said: 'I will trade; hut you must not kick, like my good mule, if you make a had swap. 'Oh,' said he, 'I am the best judge of a mule in Callahan.' And I guess he is, for I put my hlanket and saddle on his cayuse and got on. He started off, went ahout ten yards and froze stiff. I kicked him in the rihs, hut he was a rock—like what you call 'in place.' The man from Callahan he nearly had a fit laughing, and he said: 'What you waiting for? You've said good-hye, Greaser; why don't you get a move on you?' I said: 'I'm only waiting to see you move first.' Well, that man from Callahan he led Quo Vadis up and he put on his packsaddle. Never did I see that mule so gentle. He put on his sack of flour, his spuds, his camp kit and tools, and he threw over all the diamond hitch. Then he turned to me, and took off his hat and he said: 'Good hye, my Portuguese sucker; I will he hack here in a month and if you have any fine mules to trade, I will—' But just then his frypan slipped and rattled, and they were 'off in a hunch.' I never saw that mule so active. He was up and down like a jumping jack, and the man from Callahan yelling 'Whoa! whoa!!' and going round and round at the taut end of the lariat. Pretty soon one of the ropes cut through the sack of flour, and they were enveloped in a cloud of white. Then spuds hegan to fly out at tangents, and occasionally a pot or a pan. The man from Callahan got the lariat tangled in his legs and went down, and the latigo hroke. The saddle went one way, while the mule hit the hack trail on a dead run. My horse had thawed out during the excitement and we moved off under a cloud of flour dust. The last I saw of the man from Callahan was from the top of the hill. He was rubhing his shins and shaking his fist at me."

* * * * * * * * *

That night, as we sat around the fire in the cahin and smoked our pipes, the rain pattered on the shake roof and sputtered upon the glowing flame as it came down the mud-daubed chimney.

"This reminds me of a night I passed at Wichipec," said Old Joe. "Ever been there? Well, keep away, for I don't like the formation. The Trinity cuts through some heavy serpentines, and I struck a strong pocket trace, and was 'post-holing' and packing my dirt a half mile to water to pan. They hreed hogs and half-hreeds in that valley, and I was 5 miles from my camp with short supplies; hut I did not want to move my 'lares et penates' till I had run up the trace and decided what threw out the gold. As usual, it was a quartz stringer in the serpentine, though I eventually took out ahout two ounces from the pocket. It is there in sack No. 27. It came on to rain heavy, and, having no shelter, I took refuge with an old squawman who was baching it. He had huilt a shack, ahout 8x10 feet, from old sluice lumher, upon a steep side hill, near a spring. The upper side of his cahin rested on the ground, hut the lower side was shored up some 4 feet, and he had grown tired when he closed the ends. The down-hill side was open under the floor. It had a door and a one-pane window; two hunks, one ahove the other, and a dinky little camp stove. The place reeked with dirt; hut it was any port in a storm with me that night, and I had ahout decided to sit up and keep the fire going rather than crawl into the upper hunk. It was coming down hard and cold; so I could hardly blame the hogs for seeking shelter under the shack; hut they were noisy, rooting each other around, and their odor was noisome. The old man was in his hunk, discoursing on 'Injuns, bars and other insects,' and keeping his pipeful of Star plug tohacco lighted hy the aid of a guttering native candle.

"I asked him why he did not close up the lower side of his cabin, for whenever a hog touched the supports it was ominously shaky. 'Wall, them hogs is company fur me.' 'But the fleas! Why, man, the cahin is alive with them.' 'Wall, I reckon fleas ain't no wuss than other crawlers.' I made up my mind not to hrave that hunk, and amused myself looking through the open cracks of the floor at the moving mass heneath. It was prohahly midnight when a bright idea dawned upon me, and, without a moment's hesitation I acted upon it, hut with dire results. The old squawman was snoring away, and I had just taken the pot of hoiling water from the stove to make my sixth cup of tea, when there was renewed commotion among the hogs, and I could catch the faint torso outline of a huge one through the wide crack under my feet.

"I poured the hoiling water upon that hog.

"'Woof-oof-oof!' Away they fled, hut the big one, in sheer deviltry, no douht, holted against a corner post and carried it away. Bump! crash! down came the shack. Grind—slide—bump! and I found myself jammed into a corner, vainly wrestling with the stove. It was pitch dark, and from the bunk came words that were rare, winding up with the query of 'What'ell?' 'Hogs, wind and water,' I replied, sententiously.

"We lay hecalmed, with a list to port of ahout half-pitch. The door was jammed, hut we cut the leather hinges and it opened inward. The shack had slid down hill some 20 feet and hrought up against a huge houlder, which surely had saved us from avalanching. It was simply pouring rain; so we crawled into the shack and prayed for morning, the squawman condemning hogs, rain and prospectors impartially. The next day we straightened up the shack and I put things more ship-shape for him; hut he had a grouch and nursed it.

"A few days later he came to my camp and asked: 'Say, you ain't seen no painter round here? Ain't seen no tracks? Well, you'd hetter he keerful he don't pack you off. He tried to get Canyon Mary's hig hog, hut she drove him off with a cluh—not before he clawed the hog's hack up pretty had. The squaw's man, Charley, just told me, and he's 8 feet long.'

"'Who? Canyon Mary's man?'

"'No, you fool pilgrim; the catamount.'"

* * * * * * * * *

We smoked in silence for some time, and, in answer to their inquiring looks, I said:

"Well, I have not swapped any horses, and I have scalded no hogs on this trip, but I had a hand-to-hand conflict with a full-grown hear that, for intense excitement and temporary heart failure, was the real thing as long as it lasted.

"I ran across a ledge of talc-hearing telluride near Know Nothing creek, and, before I wasted any needless work, I put up a hluff 'Notice of Location' and took my pan concentrates to Bennett's to he mailed for assaying and classification. It proved to he nagyagite. Look it up, Joe, and we will assay my general samples to-morrow. You hoth know The Forks, hut the day I arrived was a red letter one. They had three fights, a squaw hair-pulling match, and a new papoose. A whiskey drummer had strayed in and a yellow-legged Pine street expert had arrived for his company. These two had incautiously bolted a few jolts of native red-eye, and their inner men were ready for fight or footrace. You know the kind of forty-rod they make and sell.

(Manuel rolled his eyes and moistened his parched lips at the very memory.)

"It has the flavor of tobacco juice and cayenne, and is strong in the houquet of hurnt sugar. The yellow leg expounded the Cretaceous, Jurassic and Glacial, and the whiskey drummer sat in a skin poker game. The natives who could not work into the tinhorn circle surrounded the expert with open and drooling mouths, knowing that if they let him do all the talking the fire from within would soon dry up his salivary glands and a 'shout' would follow. He mixed up 'chalcocalcites' and 'mortified porphyrites' till his voice grew husky, and they carried him aloft, sound asleep. I was reckless enough to take two drinks, and that night about 1 o'clock I awoke with 'fever in my blood.' My mouth was parched and my head throhhed. I hustled into my clothes and rustled for water. It was pitch dark, and I harked my shins and fell flat over a man stretched out on the porch. Nothing short of the river appealed to me, hut when I came to the corner of the huilding I heard the music of flowing water in the hack yard. Talk ahout the 'chink of the ice in the pitcher,' give me an old-fashioned water spout to hold my head under. I cautiously groped in the direction of the stream, humped into a fence, climbed over it, took a few steps, and was enfolded in the hairy clasp of a monster bear. His fetid hreath poured into my face, and it was not the attar of roses. I executed a pas-de-seul in the most approved style, and we side-stepped in a manner enviable; hut, after the first crush, I regained what wind he had squeezed out of me, and realized that it was only play for this tame beast, and that the clanking chain must he fast to a post; hut in which direction was that post? We swayed, and I tried to get a half-Nelson on him; but the trick was evidently old, for he leaned upon me and down we went. I thought every rih in my hody was floating, but I rolled over on my face and played 'possum. This may work on a wild hear; but don't try it, if you are in a hurry, with one trained to wrestling. How many years I crawled around that hear pit, and how many times he wallowed me in a mud hole near the water trough, no one will know; but I remember taking a solemn oath to forever ahjure Injun firewater. Finally he left me of his own accord and I lost no time in crawling out of his reach. I sat there till I regained my breath, then made a wide detour and reached the river.

"Upon my return to the house I ran into the Pine street expert upon the stair, half-dressed and with a candle in his hand.

"'Water—water!' he gasped. Where's water?'

"'If you will take a fool's advice, go to the river,' I replied, and I noticed that he looked at me hard, hatless and muddy as I was.

"I had hardly taken my clothes off when hell seemed to he turned loose in the hack yard. 'Murder! murder! Help! help!' There are five dogs to every native down there, and every cur was in full yap. The coyotes took up the chorus from the hills, and the drunk lying on the porch let off every chamher of his six-shooter. Yellow leg never ceased for a moment, but shriek after shriek rent the night air, for he had undouhtedly fallen into the same trap that I had, though under the disadvantage of having no previous experience with pet hears.

"The entire camp turned out to the rescue, for he was too good a thing to lose; but I turned in, and awoke stiff and lame the next morning to find the expert had already made a sneak, while the drummer was negotiating a loan upon his 'tiamont stud' in order to get hack to civilization."

A CALIFORNIA MINER.

A Power Drill Sharpening Machine.

John and William Word of the Black Oak mine in Tuolumne county, Cal., some months since invented a power drill sharpening machine which they have been successful in introducing in the Michigan copper mines.

The machine weighs in the neighhorhood of 1800 pounds and is operated by compressed air. The sharpening is done by two hammers, one vertical and the other horizontal, each striking a hlow of from 80 to 2000 pounds pressure, as determined by the operator.

The steel being heated, the first process is the rounding of the shank of a drill so as to fit it for the chuck of the drilling machine. The other end of the drill is then put under the vertical hammer and on what is known as the upsetter. The shaping follows and then the sharpening commences. First, the corners are sharpened and then the drill is put under a swage to give it uniform thickness and size. The sharpener puts an edge on the drills not unlike that of a new knife. The end of the drill is cut in the shape of a cross-hit. After the drill has been sharpened it goes through the dollying process, hy which the edge is straightened, and then it is tempered.

The machine is built on a sort of moving anvil, the ohject of which is to permit the changing of the tools underneath the hammer. This is so nicely arranged that it can he moved from one tool to another in less than a second's time. The drill is held by an adjustable dead block which, like the entire machine, is worked hy air pressure. The shaping of the drill is done by means of the vertical hammer, the sharpening hy the horizontal hammer, and the finishing touches are put on hy the vertical hammer.

The great feature of the new machine is the fact that one man can operate it, the hammers being controlled hy a foot lever, a backward motion working one and a forward motion the other. The machine is easy to operate and it is said that under favorahle conditions two drills can he sharpened per minute.

The Cyanide Assay for Copper.*

By H. H. Miller.

In spite of its recognized irregularities, the cyanide assay for copper has always been popular among volumetric methods, being easy and rapid and reasonably accurate when the solution tested contains nothing but pure copper and ammonium salts. In order to secure this condition, however, especially in operating on low-grade ores, tailings and slags of complex composition, it is the practice to precipitate the copper from the ore solution, usually by means of metallic zinc or aluminum. The copper thus precipitated in the metallic form must be dissolved again; and the separation is never, in practice, complete, since an appreciable amount of the copper remains behind in the first solution, and the second solution always contains some of the other metals of the gangue; so that the result is at best but partially satisfactory.

On the other hand, if this course is not pursued, but, as is the practice in many laboratories, the first solution, with or without previous filtration, is treated with an excess of ammonia, and the resulting precipitate of Fe, Al, etc., is filtered off, the difficulties in the way of an accurate assay are still greater. A portion of the copper remains behind in the precipitate, necessitating a second and sometimes a third solution and reprecipitation to secure a precipitate free from copper. Even with this additional manipulation, and consequent loss of time, the results obtained are incorrect. The amount of the standard KCN required to decolorize the solution is affected by varying temperature, varying amount of free and combined ammonia, and volume of solution. The presence of other metals also affects the process. Silver, zinc and nickel, if present, react with the KCN like copper, while manganese retains copper in the precipitate to a greater extent than iron, besides obscuring the end reaction.

Having had occasion recently to make a large number of determinations of very low-grade materials, where it was necessary to know the copper contents accurately to within .01% or .02%, I have employed the cyanide assay with complete success, notwithstanding the difficulties above cited. Careful attention to details and the introduction of a system of comparative standardization have resulted in a method which leaves little to be desired as regards speed of working, combined with a very fair degree of accuracy. The principles involved are: (1) The greatest possible uniformity in every stage of the assay; and (2) the adoption for each particular class of material of a value for the KCN solution obtained by standardizing in the presence of that material.

Details of Working.—The details of an assay or set of assays of material containing from 0.1% to 0.5% of copper are as follows: Ten grams of the ore are weighed into a No. 4 porcelain casserole and digested on the hot plate until complete solution is effected. The acids used, degree of concentration, time of heating, etc., will depend on the nature of the ore; and each operator will determine these features for himself, bearing in mind, however, that in this, as well as in all subsequent operations, what is once adopted must be strictly adhered to in every assay of the same class. When solution has been effected, the sides of the dish are rinsed down with a stream of hot water and the proper amount of dilute ammonia is added, the contents of the casserole being well stirred before and after the addition of the ammonia. The assay is then returned to the hot plate, heated moderately for five minutes, and then filtered hot through a 7-inch filter into a narrow beaker of 250 c.c. capacity. Nearly the entire contents of the dish can be poured out at once onto the filter and the balance is sluiced out with a stream of cold water. The mass on the filter is washed twice with cold water, the jet being forced with the full power of the lungs, so as to stir up and wash the precipitate thoroughly with the minimum quantity of water. The liquid filters rapidly, and the clear blue filtrate, after two washings, should now be almost cold—not over 70° F; and, if the washing has been properly performed, the bulk should not be over 180 c.c. If it be less than this, more water should be added. It is convenient to have a strip of white cardboard bearing the 180 c.c. mark for the size of beaker used. By standing this strip alongside of the beaker, the volume of the solution can easily be measured.

The solution, if cool and of the proper volume, is now ready for assay. Place the beaker under the burette on a square of white filter paper. Run in the KCN solution rapidly, stirring vigorously meanwhile. As the color fades, proceed more slowly and cautiously, adding the standard solution in drops, instead of a continuous stream, as at first. If the ore solution contains manganese, a precipitate will begin to form as the color fades from blue to violet. This precipitate, which appears in the form of a dirty bluish green or brown discoloration, obscures the end reaction, and must be removed by filtration before the finishing point is reached.

Keep the attention fixed on the side of the beaker, near the bottom, looking down transversely through the cloudy solution. As long as a decided tint of violet can be seen on the mirror-like surface of the glass, the cautious addition of KCN can be continued, drop by drop. Stop before this color becomes too faint, and filter rapidly through a thin filter paper. Washing is unnecessary, as the solution is now too close to the finishing point for the trace of copper absorbed by the filter to affect the result appreciably. The filtered solution, which should be very light blue or pale violet in tint, can now be easily brought to a delicate, hardly perceptible rose pink, which should be the finishing point for weak solutions. For solutions containing much copper, it is necessary to finish with a more decided pink, since it takes a little longer for the last color to fade from a solution which was ripe in color at the start. Where no manganese is present, refiltering will usually be unnecessary, the solution remaining clear to the finishing point. A considerable excess of manganese may cause trouble in the assay, especially in the presence of ammonic chloride, as the precipitated hydroxide then forms very slowly and keeps making its appearance as a milky discoloration in successive filtrates. This can be very largely prevented, however, by the presence of sufficient iron, as the iron precipitate seems to carry with it all but a trace of the manganese.

A little longer heating after the addition of the ammonia also aids in securing a filtrate free from disturbing quantities of manganese.

Standardizing the Potassium Cyanide Solution.—From what has been already pointed out, it will be clear that the amount of KCN necessary to discolorize the solution does not give the true amount of copper present in the ore, when the latter contains other bases which interfere with the assay. When the acid solution is precipitated with excess of ammonia, Ag, Ni and Zn, if present in the ore, go into the solution and react like copper with the KCN; while Fe, Mn and Al are precipitated as hydroxides. This precipitate invariably contains a small portion of the copper which, in the case of iron, is probably mechanically retained; but where manganese is present there is a further retention, possibly as a manganate.

Arsenic may also form an insoluble arsenate, and Cr also interferes.

In looking for a way to obviate these difficulties, I began by assuming that the amount of copper retained by these causes combined, varied directly as the ratio of the total copper to the disturbing elements present. Experiment proved this assumption to be a true one, at least to a very close approximation, and this fact, once established, the course of procedure became clear.

In standardizing the KCN solution for any particular ore or class of ores of the same composition, two portions of ten grams each are weighed out for separate assays. To one of them is added a weighed amount of pure copper and the two are run together, being treated in all respects like regular assays. The difference in the number of c.c. of KCN used in the two assays represents an amount equivalent to the weighed excess of copper taken, and from this the true value of the ore is readily ascertained. Operating on the same weight of identical gangues, this figure (with frequent checking) is used. For a different gangue, or a different weight of the same gangue, another test must be made; and whenever an accurate determination of a new ore is required the assay is run in duplicate, as above described.

If due attention is paid to the above details, I believe the cyanide method will prove itself superior to the iodide volumetric method. The latter is certainly no quicker and consumes much larger quantities of chemicals, besides being subject to many sources of error. The colorimetric assay, an improved application of which has been described by J. D. Audley Smith in a recent paper before this Institute, is adapted to low-grade ores only, and for these does not seem to possess any advantages over the cyanide method, either in point of time or accuracy of results.

By effecting the solution in acid on a thick asbestos pad, heated by gas or gasoline burners, a number of assays can be run through at once, requiring little or no attention from the time they are placed on the fire until they are ready for the addition of ammonia. The "mixed acid" used is kept prepared in quantity and so is the dilute ammonia. For measuring out the portions of acid and ammonia for each assay the most convenient vessel is a graduated cylinder of 100 c.c capacity, with a foot.

The same method can be applied with equal success to richer ores, as well as to concentrates and mattes. For low-grade ores, containing not over 1% of copper, the KCN solution should not be stronger that 1 c.c. = 0.005 grams of copper. For richer material a solution of twice this strength can be used to advantage.

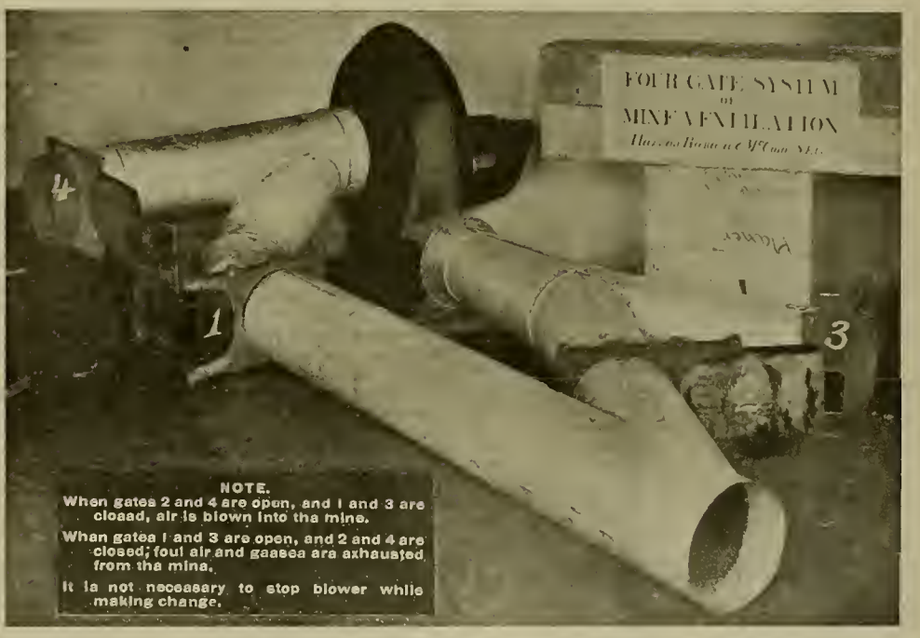
Quadruple Gate System of Mine Ventilation.

The illustration herewith shows the essential features of a system of mine ventilation devised and introduced by Harron, Rickard & McCone of San Francisco, Cal., some six or eight years ago, and which in operation has been found very efficient. This system



FOUR GATE SYSTEM
OF
MINE VENTILATION
4
1
3
NOTE.
When gates 2 and 4 are open, and 1 and 3 are closed, air is blown into the mine.
When gates 1 and 3 are open, and 2 and 4 are closed, foul air and gases are exhausted from the mine.
It is not necessary to stop blower while making change.

enables the engineer to drive fresh air into the mine or draw the smoke out by simply manipulating the gates and without stopping the fan, as may be signalled from below. In the cut it will be noted that the blast gates are numbered, and that gates Nos. 2 and 4 are open and Nos. 1 and 3 are closed, which is the position of the gates when driving air into the mine. By closing Nos. 2 and 4 and opening Nos. 1 and 3, the fan will exhaust or draw the air out. All mine operators will appreciate the importance of drawing the smoke out of the shaft or drift as soon as the blast is fired, and not to blow the smoke out through the shaft and thus distribute the foul air through the entire working. After the foul air has been drawn out, the air current can be reversed and the pure air forced to the point where it is mostly required. Detailed information may be had from Harron, Rickard & McCone, 21 and 23 Fremont St., San Francisco, Cal.

The bill to adopt the weights and measures of the metric system as the standard for the United States, as introduced by Representative Shafroth of Colorado, has been ordered favorably reported by the House Committee on Coinage, Weights and Measures. It provides that after Jan. 1, 1904, all the departments of the Government of the United States, in the transaction of all business requiring the use of weights and measurement except in completing the survey of public lands, shall use only the weights and measures of the metric system, and after Jan. 1, 1907, the weights and measures of the metric system will be the legal standard weights and measures of and in the United States.

At the University of Michigan it has been made obligatory for engineering students to spend six months between the junior and senior years in work. The civil engineers will put in the time in field surveying, the mechanical engineers will do engine designing, the electricians will do foundry work, and the chemists will study dynamos and engines.

Adiabatic Expansion and Compression of Gases.

Written for the MINING AND SCIENTIFIC PRESS by H. D. DIBBLE.

In number nine of the current volume of the MINING AND SCIENTIFIC PRESS we told how to find the ultimate velocity of gases, by the heat given up in their expansion. In this article we will furnish the means of finding the temperature of adiabatic compression and expansion of gases, and this without the use of anything more than the mere rudiments of ordinary arithmetic. For this purpose the tahle given below has been computed from the formula:

$$\text{Log.} \frac{P^1}{P} \times \frac{2}{7} = \text{index logarithmic ratio,}$$

where P^1 is the greater pressure. Owing to a slight difference in the specific heat of air at different temperatures and pressures the formula does not at all times give results that are perfectly correct, but the limit of error is well within the requirement of good engineering practice:

Gauge Pressure.	Atmospheres.	Logarithmic Ratio.	Gauge Pressure.	Atmospheres.	Logarithmic Ratio.
10	1.69	1.16	76	6.17	1.68

Air at 60° F. is compressed adiabatically to 100 pounds gauge pressure, what will be its temperature? Looking in column one under gauge pressure we find the number 100, and opposite it in column three we find the logarithmic ratio to be 1.80; then multiplying the absolute temperature 60 plus 460.66 or 520.66 by 1.80 we get 937; subtracting 460 we have the answer, 477° F.

Air at 75 pounds pressure and 60° F. expanded to the atmospheric pressure, what will be its temperature? Looking in column one we find the number 75 and opposite that in column three we find the ratio to be 1.67. In this case we divide the absolute temperature 520.66 by 1 67 which gives us 311, which subtracted from 460 gives the answer —149° F.

A gas engine with a compression chamber of one-third and a stroke of two-thirds, what will be the temperature and pressure of the compression? In this case the compression isothermal will be three atmospheres absolute. Looking in column two under atmospheres we find the number 3.04, which is near enough for our purpose, and the ratio that corresponds is 1.37; multiplying by the absolute isothermal pressure, 43.1 pounds, we get 59 pounds absolute or 44.3 gauge pressure. The explosive mixture before compression consisted of two-thirds air and gas at 60° F. and one-third the spent gases of the previous explosion of say 1000° F., giving to the charge the temperature of 373° F. or 833 absolute; multiplying by the same ratio as before gives us 1141 absolute or 681° F.

In the same cylinder, the temperature being 2681° F. and the gauge pressure 150 pounds per square inch, what will be the temperature and pressure at end of the working stroke? The expansion being from one to three we use the same ratio, 1.37, the exhaust pressure isothermally would he 50 pounds per square inch; dividing the absolute pressure, 64 7, by 1.37 we get 47.2 absolute or 32.5 gauge. The temperature, 2681° F. or 3141 absolute, divided hy 1.37 gives 2292 absolute or 1832° F. at the pressure of the exhaust; when expanded to the atmosphere the heat of the spent gases would be 1083° F.

A Suggestion.

TO THE EDITOR:—In some solvents of gold, the action of nitrogen appears to be only a presence action, a pusher, or assembler of favorable conditions. This action, if investigated by some person having the necessary skill and laboratory requisites, might result in the discovery of a solvent or solvents of gold of far greater industrial value than any solvent now used.

Permit me to use the word nitro, as a general term for any compound in which nitrogen is present, and N as its symbol; and also to write the formulas of three entirely different kinds of solvents of gold, thus:

Aqua regia.....HCl+N
Per iodide of nitrogen.....I+N
Cyanide of potassium.....KC+N

Aqua regia is the standard solvent for gold; it is quick in action, and carries a large load. Hydrochloric acid is a very slow solvent of gold, satisfied with a very small load even when boiling hot; add nitro, the solvent action is instantly pushed to its highest power. The product is chloride of gold; no trace of nitrate of gold is present. The actual operation of the nitro we do not know; it is said to supply oxygen, which forms an oxide that is taken up hy the chlorine.

Iodine is a slow solvent of gold; add nitro, and it rivals aqua regia in rapidity of solution. The product is iodide of gold; no nitrate of gold is present, and the nitro in this case does not carry oxygen.

Potassium carhonate is not rated as a useful solvent of gold; add nitro, and we have cyanide of potassium. The product of this solvent of gold we call cyanide of gold; what is that? Is there nitrate present, or is it as before, in the other cases, that the nitro has only had a presence action, forcing a solution by the KC?

All reports of users of KCy as a solvent for gold show that it is irregular in its action of both dissolving gold and in holding it in solution. This fault may be not so much in impurities present as in the absence of a sufficiency of some at present unknown item which the suggested investigation might discover. As a hint to the investigator, the following may be useful: Ahout ten years ago I was making some experiments in this line, using a thick gold foil, 995 fine. In one instance a piece of this foil, after two weeks' immersion in a solution of cyanide, showed no visihle diminution. I added a few drops of iodine; eight hours later the gold was all dissolved. Per cent of cyanide to water I do not remember, but think it was 5%.

Cyanide will instantly dissolve chloride of gold, and will carry a large load of it. It may have industrial possihilities as a solvent and carrier of gold far beyond our present idea of it. JOSEPH VOYLE.

WORK will soon begin on the first public land survey in Alaska. A. J. Adams of Valdes, formerly in charge of the hydrographic work of the United States Geological Survey in Washington, has been awarded the contract to run a base line through the Copper River valley preparatory to opening a tract of agricultural and grazing land in the valley. It is estimated that within the Copper river watershed there are 30,000 square miles of good farming and grazing land. The soil is described as loamy and easily cleared. The hills and valleys, it is reported, have growths of red top and bunch grass that makes fine hay. There is an ahundance of timber. The contract which Mr. Adams has secured is for establishing "the hase lines, meridians and standard parallels for Alaska in the Copper River valley." The total length of the lines is 200 miles, and after they are once established the township subdivision surveys will be made.

Splices.

The meanings of the terms "three-wire splice" and "Western Union splice" as commonly used in describing electric line work are as follows:

In the first place, the term "Western Union" is something of a misnomer in this case because the ordinary telegraph splice was used long before the Western Union Company was organized.

As the Western Union Telegraph Company, however, was for a number of years the only large company in existence that made a business of putting up wires, the ordinary telegraph splice, made by twisting the two ends of the wires around each other, became known among linemen as the "Western Union joint." It would be better to speak of it as the common, or ordinary, splice. It is shown in Figure 2.

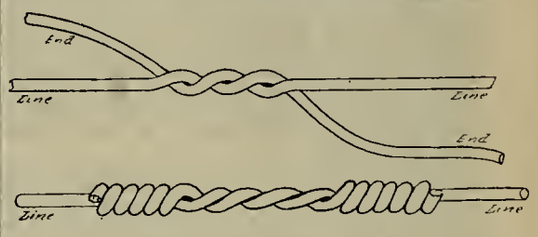

Fig. 2.—Ordinary Splice.

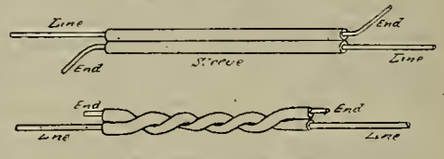

Fig. 1.—Sleeve Connection.

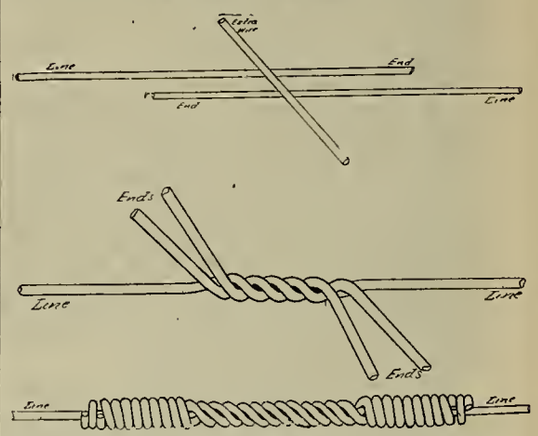

Fig. 3.—Three Wire Splice.

The three-wire splice has come into existence within the last ten years, and became necessary owing largely to the fact that copper wires cannot be twisted ("cinched," to use a colloquialism) as tightly as an iron wire joint. It was also found that the introduction of a third wire into the joint greatly decreased its electrical resistance so that a connection of this kind possesses a lower resistance than even the well-known copper sleeve splice, illustrated in Figure 1.

The various processes of making a three-wire joint is shown in Figure 3. The ends of the wire are made to pass each other the same as in the ordinary splice. A third wire from 8 to 12 inches long is also placed alongside of both of them, and all three are then clamped in the middle by the ordinary clamp connectors and twisted around each other in the same manner as in the ordinary joint, except that there are two ends to handle on each side of the center instead of one as in the ordinary splice.

A joint made in this manner is much stronger than the ordinary kind and it is not necessary to twist it quite so tight in the center, while it also, as said before, possesses a lower electrical resistance.—Am. Telephone Journal.

THERE seems a probability that before many more years have passed many of the water powers of the western mountains will be applied to the operation of the railways that traverse them. An experiment in Switzerland indicates this. The Thum-Berthoud trolley railway consists of 24.8 miles of steam railway which was converted in 1899 into a trolley system. The electric energy is obtained from water power. Electric traction was adopted for economical reasons. When operated by steam the annual cost of coal was 52,000 francs for five trains daily each way, and 10,000 francs for each additional train. With electricity the same expenditure has enabled the company to run ten passenger trains of equal capacity to those operated by steam and two freight trains daily each way.

Electrolytic Recovery of Copper From Low-Grade Ores.*

By N. S. KEITH.

Low-grade cupriferous rocks are those which contain such small amounts of copper per unit (say a ton) of weight that a large number of such units must he treated daily to make a commercial profit.

Where lahor, fuel, power, supplies and such requisites are cheap and the market for the product is near at hand, the percentage of the yield of copper may evidently he less than in cases where expenses are higher, as in regions remote from civilization and the market.

Low-grade ores may, then, also he defined as those which contain from 1½% to 5% copper, with favorahle conditions in inverse proportion.

Some low-grade cupriferous rocks may carry enough gold or silver, or both, to make them valuahle for treatment for recovery of all of the metals when the amount of copper recoverahle alone would he unremunerative.

There are two methods—the dry and the wet—hy which low-grade cupriferous rocks are treated. In this paper I am to consider hut one—the wet. There are varieties of the wet method, but I will confine myself to the one variety in which electrolysis is used to effect the final deposition of the copper ohtained in solution during the procedure.

There are many varieties of copper ores which may he treated metallurgically hy the wet method, but with many variations which the limits of this paper will not permit of consideration.

A rehearsal of the conditions and considerations applied hy the author in the planning and erecting of works for the electrolytic method of recovering copper from the ores of a mine a few miles from New York City may he interesting and instructive. These are the conditions:

The mine was worked intermittently from 1715 up to 1863, sometimes at a profit and sometimes at a loss, hut always hy methods crude and antiquated compared with those at present pursued in the art. All of the rock contains some copper, hut there were—and are—in it streaks, seams, veins, etc., which carry values up to 70% of copper, though these serve hut to leaven the whole to the value of ahout 2%, or 40 pounds of copper to the ton, thus making millions of tons of low-grade copper-hearing rock which may hy scientific mining and milling he profitahly worked.

Prior to 1863 the miners sunk shafts and ran drifts in this rock without any apparent system, in the evident search for the richer ore seams, streaks and veins which I have mentioned. Whether they made or lost money depended upon their luck in finding more or less of these richer portions.

Modern methods frequently warrant the working of nearly or quite all of such rock containing disseminated rich ores rather than hy picking out only the richer portions, solely for treatment, and throwing the major parts onto the waste dump pile.

The ores impregnating the rock are chalcocite (copper glance), Cu_2S (copper 79.8%, sulphur 20.2%); malachite (green copper carhonate—copper 62%); azurite (hlue copper carhonate—copper 61%); cuprite (cuprous oxide) Cu_2O—copper 88%), and some oxides of iron.

The rocks—called hy miners "gangue"—in which these ores are found are of several kinds, mainly sandstone, of the Triassic period; trap, cutting the sandstone in all directions and frequently overlying it; hreccia, indurated clays and shales. I will not attempt to theorize as to the origin of the copper contents of these rocks. They lie in a hed having a thickness varying from 20 to 60 feet, dipping westerly at an angle of ahout 9° from the horizontal. The mining is cheaply done and the rock is dumped directly into the mill from the ore skip, which is hrought from the mine hy means of an electric hoist and runs hack into the mine hy gravity. The scope of this paper does not admit of the consideration of the mining methods.

The prohlem for the metallurgist was to ohtain the copper contents of the rocks, after they were landed in the mill, in the cheapest and most expeditious manner. This was decided to he hy dissolving the copper and depositing it from the solution hy electrolysis.

In order to prepare the rock for treatment hy solvents it is passed through the following operations:

As the rock is raised up the incline from the mine hy means of a skip it is automatically dumped into the hopper of a Gates type of crusher, which hreaks the rock to the size of ahout ¾-inch to 1-inch cuhes, and smaller. Three minutes suffice for this operation on one skipload of 1½ to 2 tons.

All of the machines of the plant are run hy means of motors obtaining their current from a direct-current generator of 300 K.W. at 240 volts, direct connected to a tandem compound condensing engine. This generator also supplies the current for the electrolytic vats.

The hroken rock falls from the crusher into a steel hin holding about 400 tons. This steel hin has its hottom inclined so that it may he emptied hy gravity through gates on the side at the lower edge near the bottom.

The rock coming from the mine is damp, containing ahout 8% to 10% of water. Of necessity it has to he dried hefore further reduction in size. This is accomplished hy forcing heated air or furnace gases through the hody of orc lying in the hin. This has been found to be an economical and effective way of drying.
